AMERICAN

AGRICULTURIST

FOR THE FARM, GARDEN & HOUSEHOLD.

Vol. XXXIII

Number 1.

PUBLISHED BY THE
ORANGE JUDD COMPANY
245 BROADWAY,
NEW-YORK.

Standard Architectural Books for Carpenters and Builders.

Monckton's National Builder and Stair-Builder.—A new and original work, covering every practical branch of Constructive Carpentry, with 1,000 Working Scale Drawings, in two colors. Showing the simplest methods of fitting all Joints and Forms; method of constructing all varieties of French Roof; all other methods of Roofing, all styles of Framing; Splayed Work, Ceilings, Domes, Niches, Raking and Level Moldings, etc., with a Treatise on Stair Building and Hand-Railing, and Designs for Stair-Cases, Newels, Balusters, and Hand-Rails. One royal quarto volume, uniform with "Woodward's National Architect." Post-paid, \$12.00.

The above work is also divided and published in two volumes as follows:

Monckton's National Stair-Builder.

—Is a complete work on Stair-Building and Hand Railing. Fully explained and illustrated by large scale diagrams, in two colors, with designs for Staircases, Newels, Balusters, and Hand-Rails. Royal Quarto. Post-paid, \$3.00.

Monckton's National Carpenter and Joiner.

—A complete work, covering the whole science of Carpentry, Joinery, Roofing, Framing, etc., fully explained and illustrated by large scale diagrams in two colors. Royal Quarto. Post-paid, \$6.00.

Woodward's National Architect.

—1,000 Designs, Plans, and Details for Country, Suburban, and Village Houses; with Perspective Views, Front and Side Elevations, Sections, Full Detail Drawings, Specifications, and Estimates. Also, Detail Drawings to Working Scale, of Brackets, Cornices, French Roofs, Sectional and Framing Plans of French Roofs, Dormer-Windows for French Roofs, Bay-Windows, Verandas, Porches, Plaster Finish, Cornices, Ceilings, Hard-wood Mantels, and all that is required by a Builder to design, specify, erect, and finish in the most approved style. One superb quarto volume. Post-paid, \$12.00.

Woodward's Cottages and Farm Houses.—188 Designs and Plans of low-priced Cottages, Farm Houses, and Out-Buildings. Post-paid, \$1.50.

ORANGE JUDD COMPANY, Publishers, 245 Broadway, New York.

Woodward's Suburban and Country Houses.—70 Designs and Plans, and numerous examples of the French Roof. Post-paid, \$1.50.

Woodward's Country Homes.

—150 Designs and Plans, with Description of the Manner of Constructing Balloon Frames. Post-paid, \$1.50.

Woodward's Graperies and Horticultural Buildings.

—Designs and Plans of Hot Beds, Cold-Pits, Propagating Houses, Forcing Houses, Hot and Cold Graperies, Green Houses, Conservatories, Orchard Houses, etc., with the various modes of Ventilating and Heating. Post-paid, \$1.50.

Wheeler's Rural Homes.

—Houses suited to Country Life. Post-paid, \$2.00.

Wheeler's Homes for the People.

—100 Original Designs, with full Descriptions, and Constructive and Miscellaneous Details. Post-paid, \$3.00.

Harney's Barns, Out-Buildings, and Fences.

—Containing Designs and Plans of Stables, Farm Barns, Out-Buildings, Gates, Gateways, Fences, Stable Fittings and Furniture, with nearly 200 Illustrations. Royal quarto. Post-paid, \$10.00.

Eveleth's School-house Architecture.

—A new and original work, containing Seventeen Designs for School-houses, Sixty-seven Plates with Perspectives, Elevations, Plans, Sections, Details, Specifications all drawn to working scale, with methods of Heating and Ventilation. Large quarto. Post-paid, \$10.00.

Copley's Plain and Ornamental Alphabets.

—Giving examples in all styles, together with Maps, Titles, Borders, Meridians, Ciphers, Monograms, Flourishes, etc., adapted for the practical use of Surveyors, Civil Engineers, Draughtsmen, Architects, Sign Painters, Schools, etc. Post-paid, \$3.00.

CUMMINGS' Architectural Details.

CONTAINING

387 Designs and 967 Illustrations

Of the Various Parts Needed in the Construction of Buildings, Public and Private, both for the City and Country.

ALSO, PLANS AND ELEVATIONS OF

Houses, Stores, Cottages, and Other Buildings.

BY

M. F. CUMMINGS, A.M., Architect,

Associate Author of "Architecture, by Cummings & Miller," and "Modern American Architecture, by Cummings & Miller."

Nearly eight years ago, the author of this work, in connection with Mr. C. C. Miller, architect, published a work on architectural details, which, as soon as it was presented to the architects, carpenters, and builders of the country, met with a rapid sale; and, judging from the number of editions through which it has passed, and the great circulation reached, it must have met the approval of those most interested in practical architectural works, and must have filled, in a measure, a want before unsupplied.

The success of that book has induced the author to publish a second one, which is now presented to the public, and in it will be found an extensive collection of designs illustrating the features which go to make up structures such as are needed to meet the wants of the American people.

What has been aimed at is this: To present a mass of architectural details, easy of construction, pleasing in form, and generally of an inexpensive character, and all so designed that a great variety of selections may be made from them, which, when combined in a building, will produce a harmonious whole; and it is believed by the author that this work will be found to be of value, and that its design is practicable, for there are hundreds of towns and villages, in all the States of the Union, in which the wants of the people continually demand the erection of buildings, largely of wood, and which in the hands of the builder and workman may be made elegant and pleasing in all their features, provided they have at hand a guide such as this book is intended to be.

Royal Quarto. Price, post-paid, \$10.

ORANGE JUDD COMPANY,

245 BROADWAY, NEW YORK.

THE NEW REMEDY FOR RUPTURE published by the Elastic Truss Co. at 683 Broadway, New York City, is now the only real remedy for Hernia. The Surgeon-General of the U. S. at Washington has arranged with the Truss Co. to supply their new Truss to the soldiers and sailors, pensioners, as they may need it. It has received the highest medal at the great Cincinnati Exposition, also the highest medal of the great Fair of the American Institute for 1873 at New York. The Committee of the Institute were John Osborn, M.D., No. 254 West 34th st., N. Y.; D. F. Fetter, M.D., No. 292 West 34th st., New York, and C. D. Varley, M.D., No. 318 West 22d st., N. Y. The Committee say of the Elastic Trusses sold at 683 Broadway "are superior to all others on exhibition, or that have heretofore come to our knowledge, in their perfect adaptability to the person, and also in the comfort with which they retain the bowel," etc. Call or send for a Circular. Suffering from Rupture is entirely unnecessary.

INVENTORS Who wish to secure PATENTS should write to H. C. W. & CO. 27 Park Row, New York, for Advice and Pamphlet, 100 pages, FREE.

NEW YORK, JANUARY, 1874.

NEW SERIES—No. 324.

ORANGE JUDD.

Contents for January, 1874.

Table listing contents for January 1874, including Bee Notes for January, Boys and Girls' Columns, Doctor's Talk, Game for Winter Evenings, Bull, Beacon Comet, Cattle Herd-Book, Cistern, Cold Grapery, Corn-Cribs, Corn, Kihl-Drying, Cottage, Design for a Cotton-Seed Cake Meal, Cranberries, Farm Work for January, Flower Garden and Lawn for January, Fruit Garden for January, Greenhouse and Window Plants for January, Hare, The Little Chief, Household Department, Instruments, Kitchen Garden for January, Market Report for January, Notes from the Pines, Ogden Farm Papers, Orange Judd, Orchard and Nursery for January, Patrons of Husbandry, Pig-Pen, Plant, Hoya or Wax, Plants, Indian Tobacco, Plants, Southern Pitcher, Potatoes, American in England, Sheep, Native Races of, Sleds, How Built, Steam on the Canal, Timber Tong, Tomato, One Hundred Dollars for a, Two Crops at Once, Walks and Talks on the Farm, Watering-Pot, New French, What Crops Leave in the Soil.

INDEX TO "BASKET," OR SHORTER ARTICLES. Aftermath, Too Heavy, Am. Dairymen's Assoc., American Rural Home, Ashes, Beacon Comet, Beef from Texas, Blue-Grass, Kentucky, Bone-Dust upon New Land, Bone Mill, Brahma Cattle, Naked, Brewers' Grains, Value of, Broom Machinery, Catarrh in Sheep, Prevention of, Cats, Change of Seed, Cheese, English, China or Earth Almond, Cistern, Capacity of, Clover Sod for Wheat, Colt, For a Jumping, Cooperative Store, Copper-Strip Cut, Gale's, Corn, Cost of a Crop of, Cotswolds, Cotton and Flax-Seed Meals, Cotton-Seed, Cooking, Cow, A Good Native, Cow, Value of a, Cure for Curb, Dairy Farms, Renting, Dandelion, Northern Linseed, Eggs, To Preserve, Epizootic and its Results, Farm Labor for America, English, Fertilizers, Manufacture of, Fertilizers upon Oats, Fine Catalogue of a Fine Library, Florida Settler, Frequent Working, Fruit near Chicago, Garden Library, Grain Drills, Grape, Taylor or Bullit, Grape-Vines run Wild, Grass for Pasture, Grass, Salt Muck for, Gregory's Specialties, Ground Bone, Harrow, How to Make a, Harrowing Wheat and Sowing Timothy, Harvest-Home Festivals, Hives, Homestead, How to Get a, Homesteader in Minn., Horses, Percheron and Norman, Horse-Shoeing, Instruction in, Indigestion in the Horse, Information Wanted, Injection Syringe, Irrigation by Flooding, Ithaca Horse Rake, Knitting Machine, Larch, Scotch, Manure, Management of, Mich. State Pom. Society, Much Castor-Oil, Muck on Sandy Soils, Mushroom, Mushrooms, Orchard Planting and Vinegar, Othonna-Correction, Our Western Office, Oyster-Shell, How to Colt, Pastures, Poisonous, Pears, Peas and Oats, Petroleum for Shingles, Pickle for Sugar-Cured Hams, Plants Named, Plaster upon Wheat, Pleuro-Pneumonia, Plows, Sulky, Pollen in the Atmosphere, Pork, Smoking, Potato Rot, Poultry, Hard Crop and Vertigo in, Poultry, Houses, Poultry upon a Large Scale, Question of Morality, Reports, Catalogues, and Journals, Rye, How to Feed, Sheep in New Mexico, Sheep vs. Goats, Solvents for Gutta Serena and Caoutchouc, Spreading Lime in Winter, State Granges, Strawberries, Tan-Bark for, Sundry Humbugs, Swelling of the Legs, Swollen Neck, The English of It, Tomato, Grape, Turkeys, Bronze, Virginia, As to, Weeds, Killing, Weevil in Barms, What Shall we Have for Breakfast?, White Spots.

Calendar for January.

Calendar for January showing sunrise, sunset, moonrise, moonset, and moon phase for various locations: Boston, N. England, N. York State, Michigan, Wisconsin, Iowa, and Oregon; N. Y. City, Pa., Philadelphia, New Jersey, Penn., Ohio, Indiana, and Illinois; Washington, Maryland, Virginia, Kentucky, Missouri, and California.

PHASES OF THE MOON.

Table showing moon phases for Boston, N. York, Wash'n., Cha'ston, and Chicago, including Full Moon, 3d Quart., New Moon, and 1st Quart.

AMERICAN AGRICULTURIST.

NEW YORK, JANUARY, 1874.

The present season is one of enforced comparative idleness. Holiday keeping will help to whittle away a portion of the farmer's time, after which, although the hands may be idle, there is much head-work to do. The new year is the time for laying plans for the future, and no employment needs more careful thought than this matter of laying plans. The better the plan the more profitable will be the work. No work needs more planning than farming. It is not a business to be done on the spur of the moment; and at the commencement of the year the whole future labor of the season should be laid out distinctly and thoughtfully. Then when the emergency comes one is prepared for it. This is the great secret of success in all business, and is that which often enables the less able and confident man to come out ahead of his more sanguine and more capable neighbor. Now is a good time for commencing a farm record, a book in which the farm should be mapped out, the plan of work for the season written down, the needed supplies of seeds, etc., noted, and in which at the close of each day there should be recorded the condition of the weather and the various occurrences worthy of being remembered. Especially should be set down such things as the farm operations, births, etc., of animals, payments and receipts of money, engagements or contracts, and all under the proper dates. Such a book is an interesting study in after times, and is useful as a guide to future work and calculations, and has often saved money by reason of its being able to furnish either direct proof or corroborative testimony of payments or contracts.

Hints about Work.

A Sharp Eye is of the greatest use at this cold season. Stock needs watching with care. No falling off in condition should be permitted. A little extra feed now will do great good, and will doubtless save a large expenditure two months hence. Besides, it is easier to keep up than to bring up the condition of an animal.

Cellars need ventilating and extra protection against sudden cold snaps.

A Plentiful Supply of Water is quite indispensable to the welfare of farm stock. Ice-cold water is injurious and wasteful. A bucket of such water will destroy the good effect of several good feeds. The water-trough should be kept free from ice, and it should be emptied as soon as the stock has been watered. Many people believe that sheep can live without drinking, but this is a great mistake. All animals fed upon dry feed need water frequently. Snow is no substitute for water.

Young Stock need especial care, and exposure to damp in mild or thawing weather is more hurtful than dry though comparatively severe cold.

Manure should be gathered and worked with care. If allowed to freeze it remains unaltered until late in spring. That intended for root crops should be worked over, and piled up neatly with straight sides and flat top, so that it may receive as much moisture as possible. Labor spent in working over manure is well spent. Three turnings will bring it into a condition for use in early spring.

Oil-Cake Meal will be found a very valuable addition to the feed just now. Dry feed tends to a constipated condition, which soon shows in staring hide and tight skin. A pound or even a few ounces of linseed cake meal, which costs about a cent and a half a pound, given each day to horses or cattle will loosen their bowels and improve their health. Calves and sheep should also not be neglected in the distribution.

Vermin should be watched for. A weekly allowance of sulphur given in some salt will tend to keep down vermin. Sulphur rubbed up with lard makes a good application against lice if rubbed along the spine of an animal infested. Whale-oil is also a good application. Carbolic acid and kerosene should be used with caution; they may do more harm than good if too freely used.

Snow is easily removed from paths and from the platform of the pump, etc., if attended to promptly. If trodden down the labor is greatly increased. Let the work be done the first thing every morning, and also frequently during the day if snow is falling. Nothing is gained by delay. Do not wait until the storm is over before breaking the roads about the premises. Get out the teams and keep the roads open. If you have not a snow-plow a pair of harrows will level the drifts and help to pack the snow. It is not so important how the work is done—only do it, and do it promptly.

In Starting a Heavy Load on a Sleigh be certain that the runners are not frozen to the snow, and, if possible, help the team by moving the sleigh ahead a few inches with a lever at starting.

Horse-Shoeing is a very important as well as an expensive item. A horse should be kept sharp shod in winter or not shod at all. Many a good horse is ruined for want of attention to this matter.

Farm Horses kept in the stable and only worked occasionally should be fed and managed with care. A common mistake is to let them do nothing for several days and then "put them through." A sharp trot for a mile or two until the sweat starts will do no harm, but rather good, provided they are rubbed dry afterwards. But to drive them rapidly eight or ten miles, let them stand in the cold for an hour or two and then drive them rapidly home, and give them little care when they get home, is thoughtless and cruel.

A Warm Bran-Mash is a good thing to give a horse when he is brought home hot and exhausted from a long journey. Blanket him at once, and rub his ears and legs, and then rub his belly and flanks and such other parts of the body as can be got at without wholly removing the blanket. If your man thinks this too much trouble, and will not do the work willingly, discharge him. Better part with a man than lose a good horse.

Cows that are expected to calve in March or April should, as a rule, be dried off this month. New milch-cows, or cows that calved last fall, should be fed liberally with food favorable to the

production of milk, such as roots, bran, corn-stalks, clover hay, and three or four quarts of corn-meal per day. Warm slops or cooked food will increase the flow of milk. Warm and well ventilated stables are also essential. If the cows are turned out to water be careful not to let them stay out long enough to get chilled. Farrow cows that are giving milk should have an abundant supply of rich food. They may have as much as four or five quarts of corn-meal a day. If they get fat instead of giving milk you can dispose of them to the butcher. Beef is likely to be higher.

Sheep should have dry quarters. Dry cold is better for them than warm, wet weather. Avoid close, damp, ill-ventilated basements; also be careful not to use so much straw for bedding in the sheds and yards that the manure will ferment under the sheep. Nothing can be worse.

Swine that are fat must either be sold or put into the pork barrel on the farm. The packers have matters in their own hands this year. Next year we shall get better prices. Last spring or summer pigs that are in thrifty condition will pay to winter over. Their summer feed when clover is abundant will cost but little, and they will make good and cheap pork early next fall.

Poultry should have fresh meat of some kind during the winter. Keep the hen-house clean, light, warm, and well-ventilated. Select out all the hens and roosters you do not wish to keep. Shunt them up by themselves and fatten them. A fat hen or rooster, even though somewhat advanced in age, is not bad eating. Look out for a change of roosters. On a farm where a good many hens are kept of no special breed it is well to select at least one or two roosters of a breed distinguished for early maturity and fattening qualities rather than of those species valuable as egg-layers.

Work in the Horticultural Departments.

We should be glad if every reader of the *Agriculturist* who has a bit of land to cultivate would resolve that during the coming season he would make a strong effort to have a garden where could be grown the necessary vegetables and as many fruits as space and time would allow. Too many farmers look upon the garden as a needless luxury, and the consequence is that they, of all other classes, have the least variety of vegetables and fruits upon their tables. They do not realize the benefit of a proper intermixture of vegetables with meat, and how necessary they are to health. It is a fact that people living in cities have a greater variety of vegetables the year through than the farmer. The cost of a garden is but slight, and, with the exception of the plowing and carting of manure, could all be done by children; besides, the interest the work would excite would be of great value in preventing their leaving the farm. Many a boy who is now a successful farmer dates his interest in agricultural and horticultural pursuits from the sense of his responsibility while attending to the garden or some department of the farm. So we say to all farmers, advance your own interests by interesting your children in the garden.

Orchard and Nursery.

Though January will not be thought a favorable month to attend to work in this department, yet on a second consideration many operations which can be done now will suggest themselves to the wide-awake orchardist. There will be

Cions to cut when the wood is not frozen, as a larger proportion are likely to live if cut at this season than when left until spring, as the severity of the weather often injures the buds. Take particular care to have every variety properly labeled and packed in fresh sawdust or sand where they will not dry out during the winter.

Tent Caterpillars.—Look out now for the eggs of this destructive insect. When the trees are leafless the little bands of eggs glued around the twigs, usually near their extremities, can be

readily seen and removed. If this matter is attended to at once much time will be saved when other work is pressing in the spring.

Trees.—If trees were not ordered early in the fall order at once, so that there will not be any delay when the time to plant arrives. If there is a nursery near by it will often be best to pay an extra price for the privilege of digging or selecting the trees one's self. In selecting varieties, attention must be paid to the purpose for which they are wanted, whether for market or for home use. If for market, select such as are known to succeed well in the immediate vicinity, with a fair proportion of early and late sorts. When selecting for home use many can be planted which are of fine quality but scanty bearers or poor keepers.

Rabbits and Mice.—Look out for these animals. When a light snow falls they will often do a great deal of damage in a short time. Tramp the snow firmly around the trunks to prevent the mice from injuring the bark. Blood sprinkled upon the trees will prevent injury from rabbits.

Root Grafting can be done at this season. Graft at the "collar," and never on the tips of roots. The best tying material is waxed cotton twine.

Nursery Stock.—Head back and prune into shape during mild weather.

Map the Orchard.—In winter evenings and during very cold days when out-of-door work is impossible, a map of the orchard should be made giving the position and name of each variety. This is important, as labels are liable to be lost, and if a map with the names is made it will be an easy matter to replace them; besides, a place with the trees correctly named will bring a higher price in the market should it ever be offered for sale.

Injured Trees.—Large limbs are often broken by ice and snow; these should be looked after, and the wound carefully smoothed with a sharp knife and a coat of melted grafting-wax applied.

Fruit Garden.

Many persons think that if they have one variety of each kind of fruit that is enough. This is a mistake, and one who thus plants will not experience half the pleasure which comes from selecting a proper proportion of early and late sorts. Blackberries and raspberries can be enjoyed for some weeks longer if both early and late varieties are set out. Winter is the proper time to lay out this work, and by carefully reading and comparing the statements of the best authorities one can, with a proper soil, plant with good prospects of success. There are many works upon the different small fruits, and all contain something of interest as well as value to the fruit-raiser. Trees which have been trained as cordons ought to be safe from cattle, and in the case of apricots and peaches will be all the better if a little protection is given during the winter. Grape-vines may be pruned at any time when the weather is not too cold. At the South the work of preparing the soil and in some places planting can be carried on, but at the North little outside work can be done at this season of the year. For general directions see the hints under orchard and nursery.

Kitchen Garden.

The amount of out-of-door work which can be done this month will depend upon the mildness or severity of the season. One main point, however, should be constantly in mind, and it is that whatever is done now will facilitate the spring work. If there is a large quantity of manure to draw it can be hauled to the fields as well at this season as to wait until spring; besides, if there is a light snow on the ground it can be taken out upon a sled, thus saving a great deal of labor in the matter of loading. Manure for hot-beds may be drawn out and placed in piles large enough to prevent their being chilled through; if fermentation goes on too rapidly the piles can be turned occasionally.

Hot-Bed Sashes and Frames are to be prepared early to be ready for immediate use. The usual

size for sashes is 6 x 3 feet, but for ordinary family use an old window sash or two will answer well. The frames should be made of inch boards 10 feet high at the rear and one foot in front.

Tools.—See that all the tools in use about the garden are in good condition for the next season. They will last much longer if a coat of petroleum is applied to the wood-work and the iron and steel parts well oiled to prevent rust. There are many convenient implements which can be made by the gardener if he has a little skill in handling tools. A roller, marker, and reel for a garden line are very necessary in a garden, and can be easily made.

Cold Frame.—Care must be taken to give ventilation during every mild day. The danger is not from freezing, but from the temperature becoming so warm as to start the growth before spring.

Straw Mats for protecting hot-beds and cold-frames during cold nights may be made during leisure times.

Covering strawberries, spiuach, etc., which was neglected in the fall may be done now if there is not much snow on the ground.

At the South hot-beds may be started in favorable localities, and radish, lettuce, and cabbage plants started, while hardy vegetables may be sown in the open ground.

Flower Garden and Lawn.

During the winter the value of a proper proportion of evergreen trees and shrubs becomes apparent. A lawn on which are planted the various species of pines and spruces with clumps of evergreen shrubs, such as rhododendrons, kalmias, hollies, etc., makes the place look more home-like than where only deciduous trees and shrubs are planted. Care must be taken, however, not to make the house dark with too many evergreen trees, as then they give too somber an appearance during the summer. Whenever a great depth of snow falls it should be carefully dug away from around the lower branches of evergreens, as its weight is liable to break them and destroy the symmetry of the tree.

Shrubs as well as ornamental trees need painting and manuring the same as fruit trees, and if there is little or no snow on the ground the present is a good time to do this, as the turf will not be cut up by the wheelbarrow now that the ground is frozen.

Plants in pits will need attention during mild days. Apply water sparingly when dry, and give air whenever there is no danger of frost.

Hedges.—Prune during mild weather; at the South it can be done at any time during the winter.

Roots of cannas, dahlias, etc., must be looked after often, for fear they may become damp and rot. As soon as signs of mold appear remove to a dry place. A good place to preserve them is in the greenhouse, under the stages, where there is but little or no moisture.

Greenhouse and Window Plants.

During the winter months the aim should be to have the greenhouse looking its best, and in order to do this both plants and pots should be kept clean. Dead leaves will render an otherwise beautiful plant a shabby sight. Once or twice a week the plants should be looked over and these leaves removed; this, of course, can not be done in a large commercial greenhouse where plants are sold by the thousand, as the time occupied in doing it would be too expensive; but in a private house it can be easily done. Pots should never be allowed to become covered with green mold; this can be removed with a stiff brush and water slightly warm, at least if not left too long without washing. The temperature of the house should be kept at 50° or 60°, with an allowance of 15° between mid-day and night. This temperature is only applicable to a greenhouse. Stove and orchid houses require a greater degree of heat.

Succulents.—Within the past few years the

growth of succulent plants like sedums, echeverias, cactylodons, etc., has become popular, and there is nothing which makes a lawn so beautiful as a raised bed planted with the different species of succulents arranged in bands or ribbons. These plants require the protection of a greenhouse during the winter, and without a little care in watering there is danger of losing many through damping off. A shelf at the rear of the greenhouse is a suitable place in which to keep them. They should be watered sparingly. Many varieties may be propagated, as they root readily in sand that is kept constantly moist.

Propagation of geraniums and other soft-wooded plants may be carried on at this season in order to secure a stock for spring planting or for sale.

Camellias and Azaleas now in bloom require plenty of water. Those not in flower should be watered sparingly in order to retard their blooms. After they have flowered prune into shape.

Seeds of annuals for early spring flowering may be sown at intervals, and as soon as an inch or two in height may be potted singly into small pots or shallow boxes.

Plants for Forcing may be brought into heat now and will soon show signs of flowering. Astilbe Japonica, Deutzia gracilis, etc., are good plants for forcing.

Plants which look yellow and sickly will often succeed well if repotted into good soil, first cutting the roots and branches back a third at least.

Bulbs.—Bring a few pots of hyacinths, crocuses, and other bulbs which were potted in the fall from the cellar to flower during the winter. Bulbs which have already flowered should be gradually dried off and planted in an out of the way place in the garden when the ground opens, as it will be several years before they will flower well again, as the process of flowering greatly exhausts them.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, from our daily record during the year, show at a glance the transactions for the month ending Dec. 13th, 1873, and for the corresponding month last year.

Table with 4 columns: RECEIPTS, SALES, Comparison with same period at this time last year, Stock of grain in store at New York. Rows include Flour, Wheat, Corn, Rye, Barley, Oats, and various other commodities.

Gold has been up to 109 1/2—closing December 12th at 109 1/2 as against 108 3/4 on November 13th. The business situation has changed very decidedly for the better since our last. The Money market has been working much more satisfactorily for the borrowing interests. There have been fewer reports of trouble in financial and commercial circles; transactions have been on more extensive scale, and values have very generally advanced. The Produce trade has shown a marked improvement in most lines. Breadstuffs have been in more confident demand, in good part for export and on speculative account, and prices have been quoted much higher, closing buoyantly. The very sudden and unusually early closing of canal navigation has had the effect of diminishing the supplies arriving at the seaboard and stiffening the views of holders. Large amounts of Grain have been locked up in boats which are ice-bound on the canals, and the absence of which has been seriously felt in the local market. Exporters have experienced considerable diffi-

culty in filling orders for the better qualities of Spring Wheat and of mixed Corn, even at the ruling figures. We are entering on the winter months with very moderate stocks available at this point. Provisions and Cotton have been in better request, and quoted dearer. The recent dealings in Wool have been unusually liberal, and prices have been quoted higher, closing in favor of sellers. Desirable lots of fleece have been comparatively scarce in most of the Eastern markets. Tobacco has been in moderate demand, at steady rates. Hay, Straw, and Seed have been held more firmly and have been more sought after. Hops have been quoted lower, on a moderate trade, but close more steadily. On the whole, we can safely say that the financial panic has measurably subsided. Commercial affairs have recovered quite encouragingly from the depression caused by the extraordinary financial disturbances of September and October; and the outlook at present is far more satisfactory and inspiring than could have been reasonably anticipated a month ago. Work has been very generally resumed in the manufacturing districts, and there is now much less of apprehension as to the immediate future of industrial interests.

CURRENT WHOLESALE PRICES.

Table with 3 columns: Nov. 13, Dec. 12. Rows include Price of Gold, Flour, Wheat, Corn, Rye, Barley, Oats, Hay, Straw, Cotton, Hops, Feathers, Seed, Timothy, Flax, Sugar, Molasses, New Orleans, Coffee, Tobacco, Wool, Domestic, California, Alfalfa, Pork, Beef, Lard, Butter, Cheese, Beans, Peas, Eggs, Poultry, Game, Rabbits, Turnips, Cabbages, Onions, Potatoes, Sweet Potatoes, Carrots, Cauliflowers, Broccoli, Apples, Cranberries, Peas, Grapes, Quinces, Beets, Egg-Plants, Tomatoes, Green Peas, Green-Corn, Lima Beans.

New York Live-Stock Markets.

Table with 2 columns: RECEIPTS, WEEK ENDING. Rows include Receipts, and weekly ending data for Beesves, Cows, Calves, Sheep, Swine, Total.

various ups and downs, the market on the whole has improved, and at the close of the past week stood fully 1 1/2 c. above the average of a month previously. Choice steers, in selected lots, were sold at the close at 13c. @ 13 1/2 c. @ 14c.; good Ohio steers brought 12 1/2 c.; native cattle from 10 1/2 c. @ 12c.; and Texas and Cherokee 8c. @ 10c. Prices for the past four weeks were:

Table with 4 columns: WEEK ENDING, Range, Large Sales, Aver. Rows include November 17, November 24, November 24, December 1, December 8.

Milk Cows.—The supply has about met the moderate demand; there has been no activity, and sales have been made at from \$40 @ \$30 per head. A fresh 20-quart cow sold last week at \$75. Calves.—Grass calves have arrived in lessened supply, and the market for them, as well as for veals, has partaken of the general advance. Grassers of good smooth quality were selling at the close at \$7.50 @ \$9.50 per head, and veals were bringing 7c. @ 12c. per lb. Sheep and Lambs.—Sheep and lambs now rate evenly. The lessened supply, with active demand, has caused them to move off freely, with advance in prices. At the close sales were active, at 5c. @ 7c. for sheep and 6 1/2 c. @ 7 1/2 c. per lb. for extra lambs. Swine.—The market for hogs is in better condition. In the fore part of the month prices gained over one cent per pound, and at the close the advance has amounted to quite half a cent more. Live hogs sold at 4 1/2 c. @ 5 1/2 c. per lb., and dressed, with light pigs included, brought, with slow sales, 6c. @ 7c. per lb.

FREE—Fine Gold Pens, with Silver Cases—The Best Silver-plated Table Articles—Table Cutlery—Children's Carriages and Toys—Floral Sets—Garden Seeds and Flower Bulbs—Sewing Machines—Washing Machines and Wringers—Pocket Knives—Fine Gold and Silver Watches—Melodeons—Pianos—Guns and Rifles—Cultivators—Books—etc., etc., etc.; all these are among the valuable articles to be found in the Premium List on pages 33 and 34. Any person can, with a little effort, secure one or more of these valuable articles. Thousands have done it. There is room for thousands more. It is very easy to obtain clubs of subscribers for the two popular papers, the American Agriculturist and HEARTH AND HOME. Try it.

containing a great variety of items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money:—Checks on New York City Banks or Bankers are best for large sums; make payable to the order of Orange Judd Company. Post-Office Money Orders for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

Postage: On American Agriculturist, 12 cents a year, and on Hearth and Home, 20 cents a year, in advance. Double rates if not paid in advance at the office where the papers are received. For subscribers in British America, the postage, as above, must be sent to this office, with the subscription, for prepayment here. Also 20 cents for delivery of Hearth and Home and 12 cents for delivery of American Agriculturist in New York City.

Bound Copies of Volume Thirty-two are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the last seventeen volumes (16 to 32) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Clubs can at any time be increased by remitting for each addition the price paid by the original members; or a small club may be increased to a larger one; thus;

a person having sent 10 subscribers and \$12, may afterward send 10 more subscribers with only \$8; making a club of 20 at \$1 each; and so of the other club rates.

Once More we place upon our shelves a bound volume of the *Agriculturist* by the side of the godly array of its predecessors; and while the majority of our readers are occupied with the last number for 1873, we are preparing to send them the first number of 1874. To our old friends we need only say that the paper shall be as much better than it has been as it is possible for us to make it. To those who now first become acquainted with us, we can say that we endeavor to present such a bill of fare as will be acceptable to those who are to partake of it, and we invite them to make their wishes known to us. Our correspondence comes not only from every portion of our own country but from all parts of the world. A record is made of the subject of each letter, and at proper times these are classified, so that we are able to see at a glance what our readers are thinking about and what are their most urgent needs. Feeling that every family—at least every one in rural life—would find the *Agriculturist* not only interesting but useful, we call attention to the business announcements of the publishers on pages 32 and 33. Long experience has shown that their manner of giving premiums enables them to give those who interest themselves in extending our circulation much better pay for their time and labor than they otherwise could. There is no way in which farmers or farmers' clubs and granges can supply themselves with libraries or obtain many other desirable articles so readily as by obtaining subscribers for the *Agriculturist*.

The "Basket," which is always full, has now overrun; and though a portion of its contents will be found on page 35, we have not been able to answer all the queries of our friends. Some must wait.

The German Agriculturist is published at the same price as the English edition, and is mainly a reproduction of that paper, with a special department edited by the Hon. F. Münch. Will our readers kindly mention this to their German friends? Perhaps some who employ Germans as gardeners, laborers, etc., would be glad to supply them with useful reading matter by subscribing for the German edition for them.

State Granges.—Upon the 10th of last month two very important meetings of the Patrons of Husbandry were held—the State Grange of Illinois, at Bloomington, and that of Iowa, at Des Moines. Both were well attended, some seven hundred delegates being present at Bloomington and a correspondingly large number at Des Moines. The addresses of the Masters at both Granges were full of good sense, and had reference, among other matters, to the action of the order in politics. The course of some subordinate orders in political matters was disapproved. As we learn from conversation and correspondence with some of the most prominent men in the order, they do not propose, as a body, to take a part in politics, but, just as the members of a church will vote for candidates who they suppose are not adverse to religious progress, so the members of the granges will vote as individuals for those candidates who will best advance the interests of the farmers. This position being known, it led in California, recently, to both parties presenting unusually good candidates.

Othonna—Correction.—Last month we gave an engraving of this promising new succulent, which was a correct representation of everything except the flowers. Except in bright sunshine the ray petals curl up as shown in the engraving, and the artist drew them as he saw them. We should have directed him to draw them with the rays spread flat, like those of an Ox-eye Daisy.

English Farm Labor for America.—The visit of Mr. Joseph Arch to this country has awakened a new interest in the introduction of English farm laborers. Several have written to us in regard to those who advertise their readiness to provide laborers under the auspices of Mr. Arch and the association he represents. In an interview with Mr. Arch shortly before he returned to England, he distinctly assured us that he should in no case treat with individuals, but only with governments and organized societies of known responsibility. He was so positive upon this point that it is difficult to believe that he has "gone back" upon himself and authorized unknown persons to act with his authority. If he has done this, then he is not so well fitted to represent the laboring class as his previous course gave us reason to believe him to be. Pending definite information on this matter, we advise no one to risk a dollar upon a venture, but be sure that he has some security that his money will be properly used. The sum asked in advance—\$5—is so ridiculously inadequate to

bring out a man from England, that with our present knowledge we look upon the whole matter with suspicion. A gentleman of our acquaintance has made persistent efforts to see one of the persons who advertises to bring out English laborers, and gone from hotel to boarding-house so often in vain that it looks—so far as this person is concerned—as if he were avoiding rather than seeking business. "Wait a bit" is a good motto to adopt in this matter.

Our Fine Chromos.—Read all about them on page 32. It is very easy to secure one or both.

Take Both Papers.—If both the *American Agriculturist* and *HEARTH AND HOME* are taken together they may be had for only \$4, and \$4.50 pays for both papers and a Chromo with each.

Only Ten Cents.—We advise every reader of the *American Agriculturist* who does not now take *HEARTH AND HOME* to get No. 1 for January 3d, 1874. It contains a supplement with the opening chapters of Mrs. Rebecca Harding Davis's great new story, "John Andross," and is filled with other good things. Get it of your newsdealer, or send a dime to this office, and a copy will be forwarded post-paid.

The Garden Library.—Our friend Robinson, editor of *The Garden* (England), has established what he calls the Garden Library, for the sale of new and second-hand books upon horticulture and kindred subjects. A neat catalogue, giving the works for sale and prices, can be had by addressing *The Garden Library*, No. 37 Southampton street, Covent Garden, London, W. C., England.

Farms for Premiums.—A most liberal offer of farm lands as Special Premiums is made by the Publishers to those who will secure clubs of subscribers for the *American Agriculturist* and *HEARTH AND HOME*. See particulars on third-cover page of this paper.

Do Not Fail to Read it.—The Premium List on page 33 of this paper is worthy of the attention of everybody who would like to do good and at the same time make money. Thousands of persons in years past, not only in all parts of this country, but also in British America and in other parts of the world, have each obtained one or more of these valuable premium articles by simply collecting a list of subscribers and forwarding them, with their subscriptions, to the publishers. Do not fail to read the Premium List.

Illustrated Register of Rural Affairs for 1874. Albany: Luther Tucker & Son. —If we do not always notice the appearance of this useful annual it is because the publishers fail to send an editorial copy. It is sufficient praise for this number to say that it is worthy to stand by the side of its predecessors. We do not know where more can be had for the money—30c, for which sum it is sent by mail from this office.

A Fine Catalogue of a Fine Library is that of the Massachusetts Horticultural Society, recently issued. The library is rich in new and old books relating to horticulture, and its treasures are always accessible to those interested in consulting it. Here is one library at least in the care of those who desire to make it useful, and the Massachusetts Society deserve great credit not only for accumulating such a fine collection of books, but for publishing a complete catalogue which gives not only subjects but authors in a manner for ready reference. Horticulturists visiting Boston should not fail to see this library, and if they do not find the veteran Buswell at the rooms ready to serve them they will find his place filled by his wife or son, either of whom are always ready to make a stranger welcome.

Much Castor-Oil.—A writer in the *Kansas Farmer* says: "Scientific writers inform us that there are no less than 1,500 species of the Castor-oil plant."—We do not know to what "scientific writers" this correspondent has access, but the standard botanical work of the age, De Candolle's *Prodromus*, puts up the whole number of species of *Ricinus* or Castor-oil plant, and makes—*just one!* We may add that he recognizes sixteen varieties of this species.

The English of It.—French names for fruits when they come into common use by English-speaking people, sometimes become curiously transformed. The *Gardeners' Chronicle* tells us that the pear Josephine de Malines is known in England as Joseph on the Palings. We can nearly equal that on Broadway,

where a vender placards his "Dan Jo," pears, this being his rendering of Beurré d'Anjou.

SUNDRY HUMBUGS.—If one were to sit at the window of this office and watch the passers on Broadway he would notice that among the hundreds and thousands who go by, some faces will reappear at short intervals. When his eye becomes accustomed to the crowd he will observe that certain men, either singly or in pairs, pass up and soon after go down the street, seeming to have no particular destination. These persons are not especially noticeable in the matter of dress, but the observer will find something not altogether pleasant in their faces, and if he inquires about them of some one familiar with the street he will learn that they are known as "strikers," "beats," and by other slang names, and that their business is to prey upon

STRANGERS IN NEW YORK.

The manner in which they operate can be illustrated by a bit of personal experience. A few evenings ago as the writer of this was hurrying to the boat in order to go to his home in the country, he was accosted by a person who was coming rapidly towards him with outstretched hand and countenance expressive of gratification with: "Well, well, of all things in the world! Why who in — would have thought of meeting you here! When did you get in?"—"I do not know you, sir, who are you?" was the reply. "What! Don't you recollect Dr. Norton?" he said, and seeing the kind of chap we had to deal with, we humored him a little, and instead of denying all knowledge of the "Doctor," we asked: "Well, Doctor, how is practice?"—"Oh I am not practising now; I'm in business."—"Business eh? what kind?"—"I am selling off a fine lot of jewelry and watches cheap; it is close by here, come along and see them." The Doctor was informed that New York had been our place of business for some 20 years, and that his little game would not work. There is a gang of scoundrels who infest the much traveled streets and make up to strangers in this barefaced manner, and too often succeed in fleecing them. The police when they see that one of these rogues has a victim in tow inform the stranger of the character of his companion. This is all they can do, as they can not make an arrest unless some misdemeanor is actually committed. Almost every one comes to New York sometime or another, and we must warn all who visit this or any other large city to repel the approaches of any stranger, no matter under what pretext he forces himself upon them. Do not even inquire the way to a place or ask any other information of a stranger upon the street, but always apply to a policeman, or if one is not readily found step into a respectable looking store and make the necessary inquiries.

SUSPICIOUS LIVE-STOCK DEALERS.

We have before mentioned that numerous complaints have been made of certain dealers in live stock in Pennsylvania, and letters continue to come relating transactions which, as they are represented by one of the parties, appear to be nothing less than downright swindles. The gentlemen who complain have sufficient means to forward pay for high priced animals; why do they not bring these alleged swindlers into court? The latest letter received in relation to this matter comes from a postmaster in New Mexico, and we give an extract from it to show the general tenor of the charges against the firm: "In Feb. last I sent to — & Co., of P—g, Pa., for fine chickens. I sent them a draft for \$26, and as yet have got nothing from them, only they acknowledged the receipt of the money. Then they wrote me that the Express Co. would not take them unless the charges were prepaid, and that I should send them so much (the amount of Ex. charges) and they would ship. I then mistrusted them, and wrote to pay express charges out of the money I sent them, and send chickens for the balance as per my letter. That seemed to be a deadener on them, and from that time I get no reply whatever." The writer of this letter asks if we do not think this firm ought to be exposed. We certainly do, and the best way to expose them is to bring a criminal suit against them for obtaining money under false pretenses.

THE PANIC AND HUMBUGS

seem to have a relation to one another, as while we usually have a lively opening for the winter trade we never knew matters so dull as at present. The newer States and Territories are especially favored by the humbug chaps. One gentleman living in Colorado sends us no less than nine circulars of different schemes, which he had received within a short time. . . . Those who wish to get rich quickly might invest in the

GOLDEN BUTTER COMPOUND.

This time the butter stuff hails from Mariou, Ohio. What is the use of Alderney cows when with this stuff butter can be made for "three cents a pound." We can afford to butter our bread on both sides. Those chaps in New York who make "butter" out of tallow have to kill a

cow before they can get any butter, but if we are to believe the story this "Golden Butter Compound" only needs a live calf—to purchase the stuff. It is curious to see how this butter humbug comes up about once a year now in one place and now in another, and yet there are some stupid old fogies who will keep cows and think them the proper source of butter. . . . Here comes one J. W. Stephens who hails from Newark, N. J., with his

CLARK'S BOOK OF SECRETS,

which teaches "the Secrets of Health, Wealth, and Happiness"—and must be singularly cheap at only \$1. See here, Stephens, you say that this book "Teaches how the Primitive Elements may be so combined as to produce the diamond, ruby, emerald, sapphire at very little expense or trouble." Now you are at more than "a little expense" in printing your book, and at lots of "trouble" in sending out your humbugging circulars. Why don't you, like a sensible man, just make a small handful of diamonds, or even emeralds, and get a fortune in a lump instead of by miserable dribbles. Take our advice, Oh Stephens, for which we charge you nothing. Don't you laugh when you read that your book tells "How to Make a Girl Fall in Love With You," to think that there will be miserable idiots to buy your book and believe it? Here comes some

GOOD NEWS FROM KANSAS.

Before this reaches our readers there will have been drawn (Dec. 31st), if the programme is carried out, a lottery under the name of "Grand Gift Concert" at the City of Leavenworth. This lottery is "For the Purpose of Erecting a Juvenile Reform School." We say that this is good news, for the fact that a huge lottery is on foot in Leavenworth shows a great need of reform, and as the present authorities, by their lottery gambling, are setting a fearful example to the rising generation, we are glad to learn that the youth of Leavenworth are to have a place where they can be "reformed."

DOES IT NOT LOOK SUSPICIOUS?

writes a correspondent in sending us the advertisement of The Fourth Lottery or "Gift Concert for the Benefit of the Public Library of Kentucky." Yes, good sir, it does "look suspicious," and so does every scheme of its kind. Every sensible man knows that every lottery, no matter how fairly conducted, enriches a few at the expense of many. This is "about the size of it" as they say in California: One hundred men put in a dollar each that one man may draw \$25, and the chap that runs the machine may pocket the odd \$75. So with the "U. S. Prize Association" and everything of the kind.

GENEVA \$4 WATCHES

are still to be had—or perhaps it would be safer to say—are still offered. Is it not a little funny that the "Geneva Watch Co. of Geneva, Switzerland," whatever that may be, should issue a certificate that they have appointed J. Wright & Co. [N. Y.] "our sole agents in the United States of America," and that they have appointed Howard & Co. [Phila.] "our sole agents in the United States of America," and that both certificates bear the same dates?

COUNTERFEIT MONEY OR "QUEER"

seems to be very dull. One would think that this thing would do better in time of panic, but as the swindlers always require good money in exchange for their bad, perhaps the times induce those who happen to have the genuine to hold on to it. We showed up the hotel dodge of the "Queer" dealers in the November number. These circulars are still going around with much the same old names. . . . Here is one new name, however, Rudolph A. Malataf, Erie, Pa., but as Rudolph sends the same old threatening circular, and mails it at New York, he is only "Mons. Tonson come again." Rudolph makes a mistake when he sends his temptations to our friends in the nursery and florist's business; they read the *Agriculturist*, and know "what's what."

ONCE MORE—PLEASE TAKE NOTICE.

We again call the attention of our old readers to one thing, which we give for the benefit of our many new ones as well, which is this: We hold that any one who advertises that he can cure certain complaints, or who advertises anything beyond the fact that he is a physician or surgeon, or who advertises any put up secret medicine whatever, is unworthy of confidence. We must therefore request of our friends that they will not write to ask our opinion of this or that advertising doctor. It is a waste of our time and their postage stamps. We have but one reply to make to such inquiries, which is: "We have no knowledge whatever of the person."

Other "Basket" Items will be found on page 35.

The Taylor or Bullit Grape.—E. Mauny, Freeport, Ill., writes that his vines of this variety last season set unusually full, and that the grapes, instead of being white as they should be and were in

two previous crops, ripened of a black color and were very sour. These particular vines were not protected the preceding winter, and others of the same variety that were protected bore the usual kind of fruit.—We hope that Mr. M. will experiment this winter to ascertain if covering has anything to do with this singular phenomenon. The same writer remarks that while he considers the Taylor an indifferent grape, he finds it valuable for stocks upon which to graft other kinds, the Delaware doing especially well when so worked.

"Grape Tomato."—A correspondent, whose address we have mislaid, sends specimens of what he entitles as "grape tomato," and asks if the name is correct.—This name belongs to a small variety of the common tomato, and not to the one sent, which is the Purple Alkekengi, or Purple Ground Cherry.

Harvest Home Festivals.—"Viz.," Covedale, Ohio, informs us that the harvest home festival is not unknown in America, but that a harvest home association has been in existence in Covedale for ten years or more, the annual picnics of which have been found to be indispensable. The offer of our correspondent to send us a copy of the regulations of the association is accepted with thanks. The extended formation of such associations is to be encouraged.

See Pages 32 and 33.

White Spots.—"C. B.," Groton, N. H. A white spot may be made upon a horse's forehead by blistering the part with common blistering ointment, but it must not be done so severely as to destroy the hair. A plaster of common pitch kept upon the part until it removes the hair has been used for this purpose.

Pears.—"W. P.," Some pears were received last fall in very bad condition. They may have been yours; but your letter (November 15th) has neither town, State, nor post-mark, and no clue to your address.

Kentucky Blue-grass.—W. S. Rand, Vaneburg, Ky., sends us a sod of blue grass cut November 15th, upon which green, fresh grass, over two feet long, is growing. This is intended to show the sort of winter pasture which may be had in the famed blue-grass region of that State.

Capacity of Cistern.—"P. and G.," Wilson, N. C. A cistern 8 feet wide, 8 feet long, and 1½ deep, would hold 96 cubic feet, each cubic foot being equal to 7½ gallons of water; the contents therefore would be over 750 gallons. Upon another page of this number you will find a method described of building an elevated cistern. The best material is probably hemlock or cedar lumber. Lead is poisonous, and iron rusts too readily. Zinc is also poisonous to some extent.

The American Rural Home.

There are disappointed, soured persons calling themselves pomologists who carp and snarl at every new fruit that they have had no hand in introducing, and are ever ready to malign those who bring out a novelty. We do not wonder at this—it is their nature so to do; but we do wonder that a respectable paper should allow its columns to be made the medium through which these malcontents can reach the public. The American Rural Home publishes an article in which two of the correspondents of this paper and its editor are referred to in the most ungentlemanly manner. To the writer of this communication we have nothing to say—the lion's skin of an assumed name is not sufficient to conceal the thing beneath it; nor does the editor of this paper care to notice anything in reference to himself that comes from this source. Yet we think it right to remind the editor of the Rural Home that it is not in accordance with editorial courtesy to allow one under a pseudonym to attack two brethren of the press. Mr. P. J. Berkmans, editor of the Farmer and Gardener, named a new peach in honor of the editor of this paper, and furnished us with a description of it. The Rural Home should hesitate before it gives publicity to any aspersions upon the character of a gentleman who stands so high, pomologically and socially, as does Mr. Berkmans. Before it uttered flings at the honesty of his motives or implications as to his truthfulness it could have inquired of the many pomologists of Rochester if such were justified. Mr. B. can not be injured by its article, but in what a position it places the Rural Home. The same article is equally courteous towards Mr. Bury, of Michigan, whom we quoted as having a Concord grape that behaved strangely. It contemptuously says: "We don't know aught of the man Bury." The gentleman's name is Bury; but, Bury or Bury, he has cause to congratulate himself at this statement. Fair, open criticism, even if it be sharp, we believe in, and nowhere is it more useful than

in pomological matters; but if we must have this underhanded substitute for it we beg the Rural Home not to give us bad grammar with its bad taste.

Killing Weeds.—"R.," Sault St. Marie, Spading the garden in the fall, though beneficial in other respects, will not kill weeds. The seeds of weeds are not to be frozen out. The only way to get rid of weed seeds in the soil is to allow them to germinate, and then kill the young plants. If taken at the right time this may be done in the garden with the rake. Do not hope to destroy the vitality of weed seeds either by freezing or by burying; as soon as the influences are favorable they will grow as sure as fate.

A Good Native Cow.—F. M. Bassett, Independence, N. Y., writes us that a native cow gave in June last 1,600 lbs. of milk. The latest daily yield in the month was 57 lbs. 53 lbs., or one day's milk, was churned, and yielded 2 lbs. 1 oz. of butter. Her feed was pasture and 6 lbs. of wheat bran per day.

The Michigan State Pomological Society held its third annual meeting in the first week in December. It was stated that the signs (which almost always fail) indicated that the winter would be an open one; a mild winter was considered disadvantageous to fruit-growers, but what the Society propose to do about it is not stated. Prof. Cook stated that in the last disastrous winter orchards that had been cultivated fared worse than others; in the Grand Traverse region, where the snow is generally four feet deep, fruit culture was successful. Fruit near Kalamazoo had suffered from the drouths of summer. The often vexed question of the best and hardiest grape came up. Mr. Chilson, of Battle Creek, considered the Delaware the hardiest and most money making; the Diana the best keeper; approved of covering the vines with earth in winter, and that no grapes were hardy enough for Michigan without this protection; the Iona, though it often fails, he considered a standard variety. Mr. Sterling, of Monroe, advocated Concord and Norton's Virginia; he covers. In the Strawberry discussion the Wilson was the favorite.

Frequent Working.—"E. E. R.," asks if he can injure his soil by spading every year. No. Our market gardeners plow or spade two or three times a year, and we can point out land that has been kept "always turning," as they term it, for more than fifty years. They are careful, however, to put in some manure every time a crop is taken off, and if this be done the soil is practically inexhaustible.

Fruit near Chicago.—A gentleman who has experimented for six years considers the Green Prolific and Seneca Chief the most successful Strawberries with him, and Davidson's Thornless, Mammoth Cluster, and Golden Thornless the best Raspberries. These are all varieties of black-caps, and however well they may sell in Chicago, would find a poor market in New York.

Solvents for Gutta Serena and Caoutchouc.—"D. J. B.," Wash. Co., M. D. Purg ether, chloroform, and benzole, will each dissolve these substances. The last heard of the quack medicine vender was in Paris, where he was in an impecunious state.

Mushrooms.—"E. E. R.," The "spawn" is what corresponds to the roots and stems of other plants, the mushroom, or eatable part, is the portion of the plant which corresponds to the seeding portion. You will not be able to grow them in common garden beds. They need a bed of horse manure, and proper attention to shade and moisture.

Cotswolds.—"E. E. R.," These are among the largest breeds of sheep. If your ram is small he must be a grade.

The Scotch Larch.—"G. C.," New Jersey. The larches are not evergreens, nor are their branches sufficiently rigid to make them useful as hedge plants, therefore your other questions need not be answered.

Ashes.—A correspondent asks if ashes from a stove will be of use upon his garden, but does not say what he burns in his stove. Wood ashes are good for almost all crops; coal ashes had better be used for walks unless in very stiff land, where they may be of mechanical service.

Swollen Neck.—"L. A.," Fountain Green, U. T. The cause of a swollen neck is almost always a badly fitting collar. If a snugly fitting collar is provided the swelling often disappears without any other remedy; if not it must have time to break, discharge, and heal.

Beef from Texas.—Ten cars of fresh beef have recently arrived in New York from Denison, Texas. The cars are the patent refrigerator cars of Mr. T. L. Rankin, of Emporia, Kansas. They contained 420 carcasses of beef, which were slaughtered in Denison and Anstlu, Texas, on the 26th November, and arrived in perfect order in New York on the 6th of December, when they were sold. The running time was only five days from Denison. The results of this successful trip are that beef is brought to the New York market in a perfect condition, free from bruises and unwholesomeness contingent upon the carriage of live stock in the railroad cars, and sold at a less price, with a greater profit, to the cattle feeder, the shipper, and the transportation companies. It is expected that 500 head will be sent three times each week in future from Denison to New York. By the use of these cars much suffering will be saved to the cattle, and their ultimate destination will be reached in a much less painful manner than otherwise.

Beacon Comet Stb.—This bull, of which a portrait is given elsewhere, is nearly four years old, having been dropped February, 1870. His color is mulberry fawn. He was bred by Mr. Crozier, being out of his imported cow Josephine, by Beacon Comet. He was one of the Jersey herd exhibited at the New York State Fair of 1872, to which the gold medal was awarded.

See Page 35 for other "Basket" items.

What Shall we Have for Breakfast?—The answers to this question were unexpectedly numerous, no less than 237 having been received. Some of these were simply bills of fare without any comment, while others contained useful suggestions and recipes. To reduce this mass down to forty or fifty of the best was an easy matter, but to say which was the best one, or best three of this smaller number, was exceedingly difficult. Then again, those living near the coast naturally propose quite different articles from those living far inland, and a Southern housekeeper's list of articles quite different from that of her New England sister. As the most satisfactory way of awarding the premiums, we divided the contributions geographically, awarding a premium to the best from each of the divisions, New England, Middle, Western, Southern, and Pacific States, as follows: Mrs. Thomas S. Robie, New Ipswich, N. H.; Miss J. J. O., Woodbourne, Sullivan Co., N. Y.; Mrs. Allen G. Bonham, Oxford, Ohio; Mrs. Anna Tanner, Evergreen, La.; Mrs. G. H. Kellogg, Crescent City, Cal. Some of these bills of fare, with their accompanying recipes, will be published in the Household in future numbers, and there is much that is useful in many of the articles which did not receive the premiums.

Ithaca Horse Rake.—"C. W. D.," Guilford, Ct. The Ithaca Horse Rake is made by the Wheeler and Melick Co., Albany, N. Y.

Swelling of the Legs.—Dr. "H. A.," Columbia Co., Wis. When the legs of a horse swell upon standing in the stable it is an evidence of debility, general or local. It would be well to increase the food in quantity or improve its quality. The following might also be of use—viz.: Powdered sulphate of iron, 1½ oz.; gentian root, 2 oz.; chlorate of potassa, 1 oz.; mixed and divided into 12 powders. One of these given in cnt feed as little moistened as possible night and morning. Ground oats would be better for feed than corn. Friction by rubbing with a coarse woolen cloth upon the parts would also be helpful.

Naked Brahma Chicks.—"C. F.," Detroit, Mich. It is not at all uncommon for young Brahma chicks to be almost without either down or feathers. Eventually, however, the feathers make their appearance. Fowls of this breed are very hardy, and the want of feathers does them no injury except in appearance. Partially web feet are a monstrosity which we have occasionally seen in fowls. Such fowls should not be bred from.

Indigestion in the Horse.—"J. H. T.," Philadelphia, recommends pulverized charcoal for indigestion in a horse, to be given in the food. Also rasping the teeth of old horses in cases where the center of the tooth has worn below the outer enamel, and has left the teeth cup shaped. J. H. T. however forgets that horses' teeth do not wear in this way, but that, through a beautiful contrivance, the enamel as the tooth wears away is left in the shape of an irregularly curved and angular ridge, which forms a very perfect grinding or cutting edge, and except in very old horses these grinders are the last teeth to give out.

See Pages 32 and 33.

Value of a Cow.—"J. P. L.," Ringwood, N. C. A cow that gives 20 quarts of rich milk per day should bring the highest price current for cows in her particular locality. Prices depend very much upon locality. A cow of that character would bring \$70 in some places, in other places not more than \$40.

Gregory's Specialties.—We always like to see a man ride hobbies, especially when they are good ones. Our friend J. J. H. Gregory, of Marblehead, Mass., has always some special things in the way of garden seeds, which he makes a specialty of, although he does not neglect the standard varieties. If he had never had any other hobby than the Hubbard Squash, he would deserve well of the community, but when we take into account the other squashes, the cabbages, beans, sweet corn, melons, and we can not remember how many other things that he was the first to bring prominently before the public, we are quite sure that the gardens all over the country are largely indebted to Mr. Gregory for many of their choicest products.

Poultry upon a Large Scale.—"F. W. J.," Quincy, Ill. Poultry-raising upon a large scale has not been generally successful. It has only been profitable when carried on by experienced persons, and the business has grown from small proportions gradually larger and larger. To commence a large poultry business even with abundant capital but without experience would be one of the most hopeless of undertakings. The series of articles upon an egg farm which appeared in the *Agriculturist* in the latter part of 1871 and early part of 1872, contains a great deal of valuable information by an experienced poultry raiser.

Fertilizers upon Oats.—"Inquirer," Danville, Va. Soluble fertilizers should be kept upon the surface and not plowed into the soil. Oats may be plowed in and the fertilizer should afterwards be evenly sown upon the surface, or the seed and fertilizer may be harrowed in together.

Clover Sod for Wheat.—"B. W. B.," Christian Co., Ill. Clover sod broken last fall will do very well for spring wheat, but it should not be cross-plowed. The sod will not be sufficiently rotted to turn over. A good harrowing will fit the ground for sowing.

A Homesteader in Minnesota.—"C. T. Clough, Wilmar, Kandiyohi Co., Minn.," writes us that he and his brother took up homesteads in the central part of Minnesota four years ago, which has been rapidly settling up since then. He found the soil rich and the climate healthy. He has now 45 acres under crops, and raised last year 400 bushels spring wheat upon 20 acres, 600 bushels oats upon 15 acres, 75 bushels of potatoes upon a quarter of an acre, and 300 bushels of ruta-hagas upon another quarter. He does his plowing with two ox-teams. He has also 24 acres of Odessa wheat sown this fall. He has planted 5 acres with timber—oak, maple, ash, willow, and cottonwood. The willow is very successful as a hedge plant. Timber grows very rapidly and fire-wood will soon be plentiful at his door.

Management of Manure.—"C. K.," Pittsylvania Co., Va. The only way to rot manure in the winter is by frequent turning with repeated fermentation and guarded heatings. In this way it may be brought to a fine condition for use in the spring. Long corn-stalks can not be rotted by this process, and by no means should such corn stalks be allowed in the manure pile. It is preferable to cut them when fed, as in that state the refuse is more easily rotted, and if not rotted is no trouble when the manure is turned over.

Harrowing Wheat and Young Timothy.—"T. P. B.," Christian Co., Ky. We never spring-harrowed wheat with which timothy had been sown, and should fear injury to the timothy by doing so. The wheat being well rooted will stand the harrowing, but the young timothy would probably suffer. Since we made a practice of harrowing wheat in spring we always sowed the timothy and clover at that time, and found the grass equally as good if not better than the fall sown.

Sheep in New Mexico.—We are favored by a correspondent from Puchlo, Col., with a long communication, exceedingly rich in figures, by which it is shown that 5,000 Mexican ewes and 100 rams will in ten years increase to 591,102 sheep of a value of \$886,916.30, also that the value of the wool product of this nice little flock will be in the 10 years \$842,416.30; the total product of this pastoral business therefore, is nearly a million and three quarter dollars, of which the clear profit is figured up to the respectable sum of over one million dollars, the odd figures being generously thrown away,

That this result *might* happen figures are abundantly able to show, that it *would* happen depends upon contingencies so certainly uncertain that it is wise to avoid them. Ever since the days of Virgil's shepherds, sheep have been "always an unhappy flock," and with the best of care they will turn out so even now. Let no one try to keep a large flock of sheep without abundant previous experience.

See Pages 32 and 33.

George A. Prince & Co.'s Organs and Melodeons.—The musical instruments that come from this old and well-known house have attained a world-wide and well-deserved popularity. Their instruments include a great variety of styles and sizes adapted to use in parlors, halls, and churches. In richness of tone and quality of manufacture they are unsurpassed, some of their instruments, to our personal knowledge, having been in use for many years without needing any repairs. The many organs and melodeons from this house which have been given by us as premiums have been received in every case with great satisfaction. When musical instruments are wanted, get *good ones or get none.*

How to Get a Homestead.—"W. M.," Oneida Co., N. Y. Homesteads are still plentiful across the Missouri, but are scarce upon this side of that river; although there are some yet remaining in Western Iowa and Minnesota. But in Nebraska and Kansas, a short distance back from the railroads, there are thousands of locations remaining to be taken up. The mode of proceeding is to go to the locality desired, and at every town or railroad depot parties are on hand who will give all the necessary information as to the exact position of vacant lands. When the lot is selected, which is 160 acres for a U. S. soldier or sailor, and 80 acres for others, within 10 miles of the railroad line or within the limits of their grant, an application is filed in the U. S. land office. If the homesteader is living upon the land at the time of filing of the application, this may be done at the office of the clerk of the county in which the land lies. He must then enter into absolute occupation within six months and commence to improve his land. After five years' residence he may claim a deed in fee by payment of certain fees amounting to about \$18. The time of a soldier's service in the army is deducted from the five years' residence required for others.

The American Dairymen's Association will hold its Ninth Annual Meeting at Utica, N. Y., on January 13th to 15th. Hon. Horatio Seymour, X. A. Willard and other well-known writers will read papers at the meeting. L. B. Arnold, Rochester, N. Y., is Secretary.

Prevention of Catarrh in Sheep.—"W. J. E.," Birmingham, Ala. A damp, low spot should not be chosen for a sheep-shed. Raising the floor ten inches from the ground will be no preventive of the danger of catarrh. It is breathing the moist, cold air as much as actual contact with the damp soil that affects the sheep. A location perfectly dry and well drained should be chosen.

Change of Seed.—"J. B. S.," Concord, Tenn. With all other grains than corn a change of seed now and then is considered advisable. Potatoes are especially improved by a change procured from a different locality and soil. But corn has not generally been found to deteriorate by long planting; on the other hand there are many farmers who are now planting seed produced from the corn their fathers planted a generation ago. Running out of the corn is more likely to be the result of impoverished soil, and the best method of improvement would probably be a crop of clover upon the land, to be plowed under, or some other substantial fertilizer.

Bone-Dust upon New Land.—"H. D.," Earlham, Iowa. It will hardly pay to put bone-dust upon new prairie land, even could it be bought at \$5 a ton, which price we feel sure there is some mistake about. Bone-dust is more particularly useful for root crops, but pastures are much improved by it. Its effects are not always immediately apparent, but they are afterwards often visible for many years.

Peas and Oats.—"H. D.," and others. Peas and oats, when sown together, can not be separated in thrashing so as to make each grain marketable separately; for feed this is unnecessary. When ground together the oats reduce the highly stimulating effects of the peas. In seeding 2½ bushels of oats and 1½ of peas may be used. The seed should be drilled or plowed in if possible, as it is difficult to cover peas with the harrow.

Instruction in Horse-shoeing.—“L. S.,” Champaign Co., Ill. It is impossible to learn from books how to shoe a horse. One may learn how it should be done, but to do it requires practice. It is a very simple thing and easily learned; and every farmer should know how to do it. He may save many dollars and much time by possessing such knowledge. The Goodenough Horse-shoe Company will send a competent teacher of the art to any part of the country, in which 100 pupils, at \$3 each, can be procured, who will teach each one to shoe a horse and take care of the feet. The Granges can do no better work than in this way to have all their members properly instructed in this art, the proper care of the feet and methods of treating simple foot complaints.

Grain Drills.—“H. M. W.,” Portage Co., Ohio. We have not experimented with any seed drill sowing less than eight inches between the rows. What difference in the yield would result from making the drills seven inches apart we can not say, but the yield would probably be less than if the drills were made nine inches apart. We think nine inches the best space for drills for wheat or rye. If the crop so drilled were cultivated in the spring, there is no question of its consequent improvement.

Cure for Curb.—“D. M. H.,” Oswego, N. Y. Curb consists of a swelling immediately below the hock and at the back of the leg, upon the back sinew. It is the result of a strain or of inflammation, and is not necessarily a cause of lameness any more than a windgall, thoroughpin, or bog spavin, to all of which it bears a close relationship, except as to locality. The treatment is to rub the part with ointment of binoidide of mercury, as much as the size of a hickory nut every sixth day.

Pickle for Sugar-Cured Hams.—“Subscriber.” A very common pickle for hams is made by dissolving one pound of coarse salt with four ounces of sugar in as little water as possible (sugar-house syrup may be substituted for the sugar). This pickle is boiled, skimmed, and poured, when cold, over the hams already well rubbed with salt and packed in a barrel.

See Pages 32 and 33.

Gale's Copper-Strip Cutter.—The machine manufactured by Warren Gale, of Chicopee Falls, Mass., is the “Gale's Copper-Strip Feed Cutter,” which we have often recommended as being an excellent feed cutter.

Knitting Machine.—“J. W.,” Brown Co., Ohio. The Bickford Knitting Machine, price \$25, is considered a very good one for family use. All the knitting machines require to be used with care, and some amount of mechanical skill is needed to run them successfully. They are not so easy to run properly as a sewing machine.

Petroleum for Shingles.—“G. W. K.,” McKinney, Texas. Crude petroleum would not make a proper coating for a pine shingle roof. The roof is the part of a house most exposed to fire, and is sufficiently inflammable without soaking with petroleum. A good pine shingle roof, well laid, hardly needs any coating to preserve it, as it will last as long as an ordinary frame house. If any coating is desired, and the water from the roof is not to be preserved, gas-tar or any of the oxide of iron paints, generally known as the fireproof metallic paints, are the best coatings. Crude petroleum is very cheap, and one barrel, worth about \$5, should cover the buildings of a moderate sized farm.

Ground Bone.—“J. J. L.,” Crisfield, Md. Ground bone is a good application for almost any crop. For wheat, 500 lbs. per acre might be spread in the spring and harrowed in with a light harrow or a bush. 200 pounds of guano, however, would doubtless have a better effect upon the wheat.

Broom Machinery.—“T. S.,” Clinton, La., and many others, are referred to W. J. Brooker, Fort Plain, Montgomery, N. Y., for the information they desire as to broom-making machinery.

Epizootic and its Results.—“E. H. McC.,” Lee Co., Iowa. The epizootic, which so generally affected horses over the whole country last year, often leaves as its effects a chronic cough and a running at the nose. Besides, the complaint itself is very likely to return upon exposure to cold. It is very difficult to cure the cough and nasal discharge, which are the effects of a sort of chronic catarrh. The most effective remedy has been found to be sulphite (not sulphate) of soda, in

half ounce to one ounce doses, given twice a day for a few days, and then intermitted. If the horse is weak, some tonic, as a tea-spoonful of ground ginger, should be given with the soda. Inhalation of the vapor of carbolic acid has been found useful.

As to Virginia.—“G. W.,” Nepany, Ct. That part of Virginia around Richmond is perfectly healthy, pleasant, and fertile. Any Northern man settling there will undoubtedly be respectfully treated if he behaves himself as he ought to do in any place. If he mudds his business, and does not want to run for an office, he will have nothing to complain of there.

A Question of Morality.—“C. O. W.,” Medina Co., O. It is a perfectly honest business to train a mare—that as a farm mare is worth but \$150—and make her worth \$500 as a trotter. But if successful, it is not always a profitable business, for the reason that by working upon a farm steadily during the time needed to train and dispose of the mare, the extra money might often be earned twice over. Then again, one might fail and the time would be lost and the money besides.

Cooking Cotton-Seed.—“A. P. K.,” Greenville, Miss., writes us about cooking unhulled cotton-seed. He says: “I can prove by my experience that, so far as milk cows are concerned, cotton-seed, properly boiled while fresh, are as readily digested as the hulled seed, and may be used without any danger of injury from the presence of the hulls in the stomachs of the animals.”

Our Western Office.

The *Agriculturist* makes no claim to be especially Eastern or especially Western, but what its title indicates—wholly American. It has always been our aim to make a journal which should be welcome in every part of the country. Our office of publication is located at the great commercial center, New York, which is a matter of necessity for a paper of large circulation, as the facilities for producing such a journal are more abundant here than elsewhere. Finding a need of an office in the great commercial city of the West, we have opened one in Chicago, where our papers and books may be found, and any business in relation to the advertising, subscription, and other departments of the papers may be transacted. This office is in charge of Mr. W. H. Busbey, favorably known in connection with the *American Farm Journal*, Toledo, O., and other Western journals. Our friends who visit Chicago are invited to call at our office, Room No. 4, Lakeside Building, where they will be welcomed by Mr. Busbey.

Reports, Catalogues, and Journals.

THE MICHIGAN POMOLOGICAL SOCIETY, although scarcely three years old, is already well established and doing good work. Its report, published with commendable liberality by the state, is a handsome volume, and contains papers of interest and value.

THE OHIO STATE HORTICULTURAL SOCIETY, the butterfly of which the Ohio Pomological Society was the chrysalis, gives its report in a condensed form, containing, among other useful matter, an essay upon Small Fruits, by Lonis Ritz, of Plainville, Hamilton Co.

THE POPULAR SCIENCE MONTHLY (Appleton & Co.), keeps up the interest of its early numbers, and contains the best productions of modern scientific workers and thinkers. It is creditable to the country that such a journal finds support.

VICK'S FLORAL GUIDE.—We have before noticed the fact that Mr. James Vick, of Rochester, publishes his catalogue in the form of a quarterly, and he is early in the field with his first issue for 1874. Mr. Vick was formerly an editor, and can not get out of the harness altogether; so that in giving his catalogue proper, Mr. V. presents a number of horticultural items which are abundantly illustrated; and the whole is prefaced by a very handsome chromo of Double Portulacae.

MOON'S BEE WORLD is the title of a new apiarian journal issued by A. F. Moon & Co., Rome, Ga., the first number of which has just reached us. It is in magazine form of 32 pages. \$2 per annum.

WAITE, BURNELL, HUGGINS & Co., London, send us their wholesale seed list, which contains the usual standard varieties and some novelties. This is a very large seed house, and enjoys an excellent reputation.

SCIENCE GOSSIP.—We have for several years taken *Hardwicke's Science Gossip*, as being the best popular magazine devoted to scientific subjects in the language.

Though it is essentially English, we rarely get a number that has not much of interest to us, and we have often wished that a similar journal might be produced in this country. As the next best thing to an American popular monthly of this kind, we have a reprint of the English one by G. P. Putnam's Sons, who reissue *Science Gossip* at 20 cents a number. We do those of our readers who are in want of a popular journal upon natural science a service by calling their attention to this reprint.

Books Noticed.

For several months our notices of books have been crowded out, but we have made such arrangements as will, we trust, enable us to do better by publishers in future. While we can not agree to notice all works sent to us, we shall endeavor to keep our readers advised in regard to such publications as we consider useful.

SCHOOL AND COLLEGE TEXT BOOKS.—A valuable series of works of this class is issued by the well-known house of A. S. Barnes & Co., N. Y. Of those that have recently come to hand are *A Fourteen Weeks' Course in Chemistry*, by J. Dorman Steele, which seems to be an excellent elementary work upon the subject, and one in which we are glad to see the modern nomenclature employed. \$1.50. *A Manual of Moral Philosophy*, which accords no other commendation than that it is by Doctor A. P. Peabody, and was prepared for the use of his classes in Harvard. \$1.25.

LANDSCAPE ARCHITECTURE, by H. W. L. Cleveland, Chicago: Jansen, McClurg & Co. This neat little work discusses the principles of landscape gardening from a Western point of view, and is especially adapted to the wants of the rapidly growing towns of the Western states. It contains also an essay on tree planting upon the great plains.

HALF HOURS WITH THE MICROSCOPE, by Dr. E. Lankester. G. P. Putnam's Sons have reproduced in a neat style this popular English work upon the use of the microscope. It is mainly devoted to pointing out objects of various kinds that are of interest under the microscope, and to showing how to prepare them.

OUR COMMON INSECTS, by Dr. A. L. Packard, Jr. Salem: Naturalists' Agency. This is mainly a reproduction of articles that have appeared in the *American Naturalist*, and contains much that is interesting and valuable. Dr. Packard is one of our most competent and thorough entomologists, and we always, when we see a publication of his, regret that he is not more popular. In no branch of science is there so much need of popular works as in entomology, and we hope that some one will be found who is able to talk familiarly as well as learnedly about insects; but we have had no works since that of Harris in a style suited to the common people.

SEATS AND SADDLES, BITS AND BITTING, is the title of a work by Francis Dwyer, Major of Cavalry in the Austrian Army, published by Lippincott & Co., Phila. In this the whole subject of the mechanics of horseback riding is thoroughly and exhaustively discussed, and the work can not fail to be of great value to both civil and military equestrians.

A MAN OF HONOR, by Geo. Cary Eggleston. This appeared as a serial in *Heath and Home*, and is now published by Orange Judd Company. \$1.25. It is a pleasing story of Virginia life, without any attempt at the sensational.

SILVER AND GOLD.—Under this title J. B. Ford & Co. publish the report of Prof. R. W. Raymond, U. S. Commissioner of Mining Statistics, in a handsome form, illustrated, for \$3.50. It is a very full account of the various mines which yield what are called the “precious” metals, and describes the smelting and other metallurgical processes. Such a work, prepared by so eminently competent a hand, is highly important to all engaged in developing the mineral resources of the country.

WIDDIFIELD'S NEW COOK-BOOK, by Hannah Widdifield. Philadelphia: Peterson & Bros. \$1.75. We always notice a new cook-book with hesitation, as, like a dictionary, one can not judge of its merits or defects until after the intimate acquaintance that comes of use. At present we can only say of the one before us that it looks promising, and that such recipes as we have examined appear to be well considered and practical.

THE DAILY RECORD; OR, EVERYBODY'S DIARY FOR 1874. Hastings & Co., 202 Broadway. \$1.50. This is a diary of the size of a large foolscap page, which gives sufficient space under each date for such record as it is desirable to make. It would be found very convenient for a farm journal. A series of tables of various kinds and an almanac occupy the first part of the book, and a thin blotter is placed between the leaves—a capital plan to insure neatness.

How to Make a Harrow.—"W. B. S.," New Britain, Ct. To make a square harrow in two parts hinged together in the center, take four pieces of 4 x 4 oak or maple scantling six feet long, and eight pieces three feet long. Mortise the shorter pieces into the longer ones twenty inches apart and six inches from each end, thus making two frames or gates six feet long, three feet wide, and with four cross-bars each. Hinge the two gates together by means of three pairs of eye-bolts with a long rod passing through each pair. Put five teeth 12 inches long and 3/4 inch thick of square iron rod into each cross bar, and three teeth into each main bar between the cross bars. There will then be 52 teeth. This harrow should be drawn from one corner.

How to Burn Oyster-Shells.—"J. L. D.," Columbia Co., Pa. Oyster-shells may be burned in a pit similar to that in which charcoal is burned. The shells should be piled in a heap with layers of wood chips, brushwood, and small cordwood intermingled. A layer of dry wood split fine should be placed at the bottom of the heap, arranged so that a draft is made to the center of the heap, in which are a few sticks of wood placed on end to form a chimney. The heap should be covered with sods or coarse litter and then with earth, leaving a few holes for air until it is well kindled. Then the holes should be closed up almost entirely.

Plants Named.—"H. N. P.," Illinois. We can not undertake to determine plants sent without flowers. You do not say whether it is a native or not. If persons sending us plants will only take a little pains to send specimens in flower together with the leaves we will name them. . . . "A. N. G.," Madison, Kan. Your plant is *Callirrho pedata*. It has no common name. It does well in cultivation, and is often found in gardens at the East.

Too Heavy Aftermath.—"H. J. B. C.," New Bern, N. C. It is not economy to permit too heavy a growth of grass or clover to remain upon the land in the fall. An aftermath that will interfere with the early mowing of the grass in the spring is excessive. To prevent it we would pasture the meadow somewhat to reduce the quantity, or mow it a second time, and expend the value of the hay so made in fertilizers for top-dressing. In the present case it is probable that a good raking with a steel-tooth hay-rake, in the spring, would gather a large quantity of the rubbish, which might be used in the stables as litter and returned to the meadows at some future time.

The Northern Limit of the Dandelion.—The northernmost limit at which any flowering plant has been found is lat. 82° N. Dr. Bessel, of the Polar expedition, found at that high latitude a form of the common Dandelion, a Mouse-ear Chickweed (*Cerastium alpina*), *Draba alpina*, and a grass (*Poa flexuosa*).

Hard Crop and Vertigo in Poultry.—"A Subscriber," Adams Co., Ohio. The cause of hard crop in chickens is indigestion, which is also the cause of vertigo or dizziness. We would suggest a change in the feed, a reduction in the amount, and a stimulant in the shape of two pills of equal quantities of ground cayenne pepper, ginger, and copperas, as large as a pea, given daily for a few days. Poultry need a frequent change of food to keep them in health, and a supply of coarse gravel is also absolutely necessary for them.

Pollen in the Atmosphere.—An English physician, Dr. Blackly, has satisfied himself that that annoying disease the "Hay Fever" is caused by the pollen of grasses. He experimented upon the amount present in the air by exposing at different heights plates of glass covered with some adhesive liquid. At 4 ft. 9 in. from the ground the highest number of pollen grains obtained in twenty-four hours was 880 on a square centimeter (about two-fifths of an inch). By means of a kite he experimented upon the quantity present at higher levels, and found that at a height of 1,000 feet there were many times more than the average found near the earth, besides great numbers of the spores of grain fungus or smut were obtained.

Percheron and Norman Horses.—M. Simons, of Orne (France), connected with the Department of Agriculture and Commerce in that country, in a letter written to Mr. J. J. Parker, of West Chester, Pa., states that the true Percheron horse is now very scarce; that those who raise horses for sale as Percherons in the neighborhood of Chartres—the center of the Percheron horse trade—purchase foals in Belgium, Flanders, and other places, and after feeding them until old enough sell them as Percherons. It has now come to pass that all

heavy gray horses are classed as Percherons. But these are far from being the true race. This is but an enlarged Arab, with all the good qualities, the soundness, and endurance of the original race from which he springs. His color is a gray white or a silver gray. He must be kept under nearly the same condition of climate as in the Perche to do well. Being gentle, he must have gentle treatment. He must be well fed. His rations are 17 lbs. of straw, 22 lbs. of hay, and 20 quarts of oats.—Those remarks, which we know to be well founded, are worthy of notice by those who are purchasing heavy, coarse-boned, large-footed, lymphatic, and necessarily unsound dark gray horses, which are called Normans or Percherons, at high prices, with the certainty of future disappointment. Not long ago, we saw an importation of several so-called Percherons, of which only two could justly claim the title, and the difference between the true and false Percherons was abundantly clear. For the improvement of our native races we must have animals of pure breeds, or we make a failure.

Sheep vs. Goats.—"J. W.," Lynchburg, Va. We would not advise you to change your sheep for goats. Sheep's wool is a staple article of ready sale, while goat's hair is not. Goats are equally liable to be destroyed by dogs as sheep are. The best plan is to put the sheep every night into a pen, with a high board fence around it, and during the day keep a gun loaded with buckshot handy. A dog upon your premises without the owner is a trespasser, and if engaged in hunting sheep should be shot upon sight.

Muck on Sandy Soils.—"W. A. S.," Sunbury, Ct. A dressing of one or two hundred loads of swamp muck per acre upon sandy lands with the addition of twenty or thirty bushels of lime per acre, would be of great benefit. We have found no immediate good effects from the application of raw muck to such soil, but when we have filled the barn-yard with it to a foot in depth in the fall, and allowed the cattle and hogs to run over it and work it up along with the drainings from the stables, we have found it excellent for grass and clover when spread early in spring. The best plan now would be to haul it out and spread it in the barn-yard as soon as it is dry.

Cotton-seed and Flax-seed Meals.—"E. K. H. T.," Indianapolis.—Cotton-seed meal from hulled seed at \$25 per ton is a cheaper feed for milk cows than flax-seed meal at \$30 per ton. There is a greater production of cream from the cotton-seed, and the butter has a better color. Caution should be exercised in feeding either of these meals, lest too much be given; four pounds a day will be sufficient with other feed. Crushed oats is better to feed with them than corn-meal. For fattening stock six pounds a day of either may be fed.

Orchard Planting and Vinegar.—"J. J. H." As you do not state whether you live in Canada or Florida we can not advise you about an orchard. Vinegar can be made in less than one year from cider by keeping the room always at the temperature of 70 deg.; or by the use of an apparatus made in Ohio, and advertised some time ago in our columns, it can be made in a few days without the use of "drugs."

Poultry Houses.—"W. B. C.," Westchester Co., N. Y. There is frequently very unnecessary outlay in building poultry houses. A cheaply constructed house may be as warm and as convenient as the most expensive one. The plans given in the *Agriculturist* are adapted to both styles of building, and those who do not desire a costly one may construct a cheap house upon the same plan by varying the style and material. It is unnecessary to follow the plan exactly in any case.

Sulky Plows.—"C. D. B.," North Hatfield. We can not give you the address of a manufacturer of sulky plows; but there are several in Chicago, St. Louis, and other Western cities, and almost any dealer in plows can procure them.

Irrigation by Flooding.—"R. A. F.," Franklin Co., Mass. Mere covering a grass field with water in the spring of the year does not necessarily add to the fertility of the field unless the water brings with it some fertilizing matter in suspension or in solution. It is the suspended matter brought down by rivers which makes the annual spring floods so productive of grass upon the meadows of river bottoms; but the mere flowing of spring water upon grass would be nothing more than a watering, and not fertilizing, in the sense of manuring.

Bronze Turkeys.—Mrs. "B. J. C.," Mankato, Minn. Bronze turkeys are a variety supposed to be descended from the wild turkey crossed upon the

domesticated bird. They take their name from a peculiar brilliant bronze reflection from their plumage, and grow to a large size, birds of 36 to 40 lbs. being not uncommon. Mr. Wm. Clift, of Mystic Bridge, Ct., is an expert in regard to these birds, and we believe can supply them or the eggs.

Bone Mill.—"Englishman," Lynchburg, Va. The best bone mill is the Bogardus Mill, which costs \$500. It requires at least four horse power to run effectively. Crushed bone can be purchased in this city for \$35 per ton.

Grass for Pasture.—"T. G.," Kittrells, N. C. The best grasses for a pasture are timothy, orchard grass, blue grass, red top, with red and white clover. Which grass to choose depends much upon the soil. Upon rich limestone lands timothy, orchard grass, blue grass, and red clover may be sown; the quantity of seed would be six quarts of timothy, one bushel each of orchard grass and blue grass, and six quarts of clover. The blue grass, if it succeeds, will not show much until the others begin to run out, which will be in three years. Upon moist soils red top and timothy should be chosen. Twelve quarts of timothy and one bushel of red top would be proper quantities.

How to Feed Rye.—"W. S. L.," Ansonville, N. C. We have fed rye to horses and cows as green fodder, cut when just coming into ear, in which state it is very excellent feed. To feed rye that has been cut ripe, we would thrash it, grind the grain along with corn or oats, cut the straw in a fodder-cutter, moisten it with water, sprinkle a handful of salt and three quarts of the ground feed upon a large pailful of the moist cut straw. This makes a very good feed for an ordinary sized horse when working moderately.

To Preserve Eggs.—"K. H. S.," says that he has kept eggs for a whole year as good as fresh by packing them in plaster.

English Cheese.—G. C. Hawk, Cleveland, Tenn. The best English cheese is the Stilton, and next to that is the Cheddar. The Stilton is a very rich cheese, and has a portion of cream mixed with the milk before the curd is made. It sells in this country for about 60 cents a pound. The Cheddar sells for 40 cents a pound. It would seem as though we should be able to make such cheeses here, having a great variety of pasture and other circumstances favorable for it; but the skill is wanting. In the *Agriculturist* of April, 1867, there is an article describing the manufacture of Cheddar cheese (with illustrations), in a dairy in Otsego Co., N. Y., by which it will be seen that the manufacture of fancy cheese is already introduced in that locality; but we have not heard of its introduction elsewhere. The price of such cheese should be a great inducement for experiment.

Salt Muck for Grass.—"F. G.," May's Landing, N. J. Salt meadow muck alone is not sufficient to produce grass upon uplands. It is a very fair basis on which to build up a good fertilizer, but it lacks lime and nitrogen. These may be supplied either by the admixture of burnt shells or stone lime and ammoniacal substances, of which dried blood or flesh in powder is probably the best and cheapest. We would suggest a compost of lime and muck in proportion of five bushels of lime to one cord of muck, of which 20 loads per acre should be spread in the spring, followed by 250 lbs. of the dried blood or Peruvian guano.

The Patrons of Husbandry.

HOW THE "GRANGERS" APPEAR TO ONE WHO LIVES AMONG THEM.

[The remarkable increase of the Order of Patrons of Husbandry has been before alluded to, and we find the number of Granges swelling rapidly. Within a short time State Granges have been organized in New York and Massachusetts States, in which the order had heretofore made comparatively slow progress, while the forming of Subordinate Granges is a matter of daily occurrence. We are indebted to one of the chief officers of the order for information in regard to its progress. The last Bulletin received (late in November) gives the number of Subordinate Granges up to that date at 8,262, with a reported membership of 619,650. During the month of October last 1,050 were organized, a number in marked contrast with that for the same month of the preceding year, when only 91 were reported. The following article is by a resident of that portion of Illinois where Granges are numerous, and may be regarded as an impartial view of one not identified with the order.—Ed.]

It is assumed by some that the Patrons of Husbandry are necessarily violent partisans. Can any one imagine the abruptly courteous and hospitable farmer of the West as a violent partisan, determined on a narrow-minded course toward any particular class? The man who believes so thoroughly in his Western soil, and who is always glorying over his big corn and the rapid development of the country, can not be, in the nature of things, such a man as he is often painted by writers who associate so many unheard of things with the name "Granger."

The farmers of the West are, as they have been, open-hearted, generous; in the main contented. They nursed a special interest beyond its natural growth, and were surprised to see this interest turn against them. Indignation followed naturally, and discussion caused them to look about for a remedy. They found interests combined against them, and they found it necessary to combine in their own interest. But before this combination that made them a power had taken place, the order known as Patrons of Husbandry was at work in its own special field. It now became the basis of combination, and afforded no very great opportunities for display of ill-nature. It appealed to the farmer with a touch of idealism in his nature rather than to the prosy, discontented croaker. It became strong with the intelligent and progressive rather than with the stubborn, old foggy, and non-reading classes. In short, the organization made a direct appeal to all the better classes of farmers not conscientiously opposed to secret societies, and formed into an active body the good elements in rural society.

The sentiment of the order is generous, and there is nothing to suggest the harboring of a policy that could grow into a violent one. Although it has been dragged into the discussion of puzzling questions, its general attitude has been consistent, and it has encouraged the growth of a healthy sentiment among farmers. Under the cover of the organization, new combinations of extraordinary strength have been formed. These are not the consequences of the working of a resentful spirit, but are the first organized attempts to remedy a great evil; the first general evidence of a common business shrewdness on the part of Western farmers.

A desire to meet a wrong face to face and make it right, and the ability to protect self, do not make violent partisans. The truth is, the Western farmers are just as generous as Grangers as they are as neighbors or entertainers of new-comers, and they are no readier to become the blind instruments of designing men than before.

It has pleased some people to make something of a bugbear of the Grange movement, and persons really in sympathy with it as a matter of principle, have turned away and hesitated to investigate. That the present status is promising, all must admit. That there must be a strong inward growth in the future to make the order satisfying, its warmest friends do not deny. In many cases there is a shallowness in the forms that annoys the thoughtful. In other cases there is too much of what we denominate a "gushing element," to satisfy the earnest business man. There is possibly too much machinery of the simply ornamental kind to wear well. But none of these are serious objections. If the order is to have a future it will have a better future in this respect, and will depart from whatever experience has demonstrated of questionable utility. The growth of the order was not as rapid from the first as many people imagine. The rapid growth did not commence until the organization had been on trial some years. The necessity for thorough organization brought its machinery into use, and the order at once became popular as no other order had ever been among farmers.

Seen from a distance the ground occupied by the Grangers suggests contention, aggressive lines, and general confusion. Seen from the place of operations there is nothing of this. We see simply farmers striving after a better social life, like other men; seeking a higher standard of education and seeking to make their business as profitable as possible. All these objects are commendable, and when we consider their attitude on the railroad question, we must take the order as an order, not select certain irate and thoughtless men as representatives. Farmers stand committed to war against monopolies, and they have conducted an aggressive campaign on their own plan. The great majority of farmers realize the advantage of railroads, and have familiarized themselves with expenses and with difficulties in the way of successful management. They made demands that were treated with contempt. Railroad companies resented the making of any demand as an impertinence, and this policy precipitated a struggle which can not end to their advantage. It is often declared that the farmers have been hasty, resentful, and short-sighted. But in this respect their conduct will stand comparison with that of corporations directed by wise heads and financiers who have indulged in no small amount of railroad policy. In the present conflict with the farmers will the present policy of the railroads win? We answer no. Because

their interest is, in this case, identical with that of the farmers. Many of the roads want farmers on their lands, want producers along their lines, want the country developed by a policy that encourages rather than discourages farming. Any one act discouraging or persecuting farmers, reacts to their disadvantage, and it will be simply to the interest of great Western lines to do in common what many individual roads must do—make reasonable concessions to men who have a lasting interest in the success of our railroad system. The sooner this is done the better, and then will it be discovered that the Grangers are not wanton assaulters of any interest, but that they are quiet, good-natured people, seeking to make life pleasant by ordinary and legitimate means.

Bee Notes.—Advice to Beginners.

BY M. QUINBY.

If bees were put into winter quarters in good condition but little can be done for them at this time. Yet there is often something gained by thinking. Suppose on looking over the bees something is discovered going wrong. First be sure it is wrong, and then consider the remedy. Will any remedy with which we are acquainted apply in the present case? An important duty in this world is to think of consequences. As I do not expect that any readers of the *Agriculturist* have left their bees on their summer stands for the winter, it will be unnecessary to detail management with reference to that. Winter has commenced this season in time to make out a long one. If its severity is in proportion to its length we must expect the effect on our bees to be serious, unless extra pains are taken. Heed what was said last month.

I am in favor of urging another class in our community to engage in bee-keeping. I mean the ladies. It has been recently demonstrated that they have the ability to do many things heretofore thought inexpedient, if even it were possible. Many have the strength, and many that have not have the skill to direct in their management, as is abundantly proved. Some of them lack the courage to begin and patience to learn how, and boldness to brave the sting. Most minds require considerable discipline to surmount these obstacles. For a fine lady to receive a sting is to be dreaded, yet the smart is no more in a fair face than in a farmer's flesh. Let us endeavor to learn all we can of the subject, and how stings may be avoided, as well as how they interfere with the business.

BEE STINGS.

The fear of stings is one of the greatest obstacles in the way of successful bee-keeping. I have had patent hive men visit me to exhibit their hive. I am apt to make up my mind as to the value of his hive by going with the man among the bees. If he wants protection for his hands as well as face, or boasts that bees never sting him and then dodges on hearing a bee flying near, or if one approaches, seemingly disposed to make his acquaintance, he makes a strike with his flat hand or whisp of grass to drive it away, or if his quick motion attracts still others, and he leaves defeated whether stung or otherwise, I am apt to think that a hive of his constructing lacks some essential points, because he has not yet become acquainted with bees well enough to know what is wanted in a hive. If he has some valuable contrivance it is often purloined from some one else; and it is generally the case when looking at his hive that the only thing new about it is an idea taken from some good hive so changed as to make it worse. But when a man accompanies me into the yard and manifests no fear of stings, and is willing or even anxious to go right into the hive, I predict that he is a successful bee-keeper, or will become one if he gives his attention to it. Mr. Langstroth on his first visit to me showed more boldness among bees and avoided stings better than any man I ever met. And where is the man better acquainted with them than he is. The fear of a sting never deterred him from any point he wished to investigate.

There are many ways to avoid the greater number of stings, as is abundantly proved. But first we must try and understand under what circumstances bees are not disposed to sting; also when they are disposed to do it. This learned, we have taken one step—an important one—towards successful bee-keeping. We all know that bees will not leave the hive on a cold frosty morning when undisturbed and make an attack. Again, it is known by many that a bee away from home never stings unless first made fast. When in the fields, gathering from the clover blossom, getting drink from water spilled near the well or spring, sipping from ditch or drains, they always pay strict attention to their own business and never sting if not caught fast. How few understand this. The training of nine-tenths of the community has been such as to make them think that a bee is angry and disposed to sting at all times and on all occasions when

ever there is an object at-hand. Having witnessed them quietly at work gathering stores from a thousand fields, sipping water from a thousand rills, or sipping juices from the punctured grape or apple, or getting sweets from the sugar barrel in grocery or pantry without molesting any one does not remove the association of bees and stings. These persons suffer more in imagination than they do from the real thing itself. Generally more complaint is made by those that have never been attacked than by those who are stung most. One attack that proves serious is reported a thousand times, while others are not mentioned. The child can be taught to fear the imaginary hobgoblin as soon as it is dark. The timid are taught on the same principle regarding bees.

I shall not pretend that bees do not or will not sting on sufficient provocation. Means of defence were given them no doubt for a wise purpose. It has been so arranged by the Creator that stores gathered for their own use should be shared by man. Man, taking this for granted, in ignorance of their real nature, has attempted to obtain it by brute force alone, regardless of the effect on their disposition, and for centuries succeeded only by taking life at the same time. We are now enabled to divide the results of their labor without opposition, and justice is a little nearer done. We have ascertained that a sudden jar awakens vigilance. They seem to understand that it would dislodge their combs and ruin their home if continued. Anger is aroused, and if the colony is strong and well supplied many of them come to the outside to see what is the matter. A quick motion made by pounding or striking is at once perceived, and it induces an attack. How their ideas are communicated is somewhat conjectural. When we examine the sting we find but a tiny instrument to inflict pain—a bee could not wield a powerful one; but to make its effect powerful the Creator has added a subtle poison, secreted in a little receptacle at its base, and when used, if it only penetrates the cuticle, some barbs at the point hold it there more firmly than any muscles hold it to the bee. It is usually left in the flesh until sufficient venom is transmitted to cause acute pain. If not left there is scarcely any pain felt. The poison that is set afloat in the air awakens the attention of the whole apiary. Any moving object, especially one with a quick motion, is attacked. Every sting inflicted sets afloat more of the poison, and the disturbance becomes more general. This seems to be the kind of language understood by the bee. The exclamations of some persons when among them seem so near like that given out by the poison that they do not appear to perceive the difference, and act accordingly. Now, without endeavoring to show further that this is language, we act as if it were, and set about "confounding" it. Smoke will do it effectually. Most substances while being consumed by fire will furnish the material. Smoke made of tobacco was once thought by a few to do it best; but subsequent experience shows other things better and cheaper. Linen or cotton rags, sawdust, paper rolled up so that it will burn without blazing, rotten or decayed wood made very dry is probably the least trouble. Wood that is solid or hard when green is better than the softer kinds. I do not discover much difference in the variety; hickory, maple, or apple-tree are good. Let it be decayed so that it will just hold its shape when sawed or split into sticks an inch or more square. An improved method of applying this smoke will be given at some future time. Set one end on fire, and if dry it will burn without a blaze. A few pieces will smoke for hours. If the bees are disturbed, and their poison sent out in the air, this smoke mingled with it neutralizes or changes its effects. The smoke of tobacco subdues even better for the time being, but something remains unpleasant to them—makes them cross; while the milder smoke seems to soothe as well as disarm, and the disturbance is not remembered.

Bees collect a substance called bee-glue or propolis, with which they seal up all crevices. Any opening or hole not large enough for a bee to pass is filled with it. Boxes are sealed fast, frames glued together, hives held to the bottom board, and top to movable comb hives fastened by it. In a warm atmosphere it is soft, tenacious; in a cool one hard and brittle. Now anything fastened by this substance can not be moved in a cool morning without a jar. The more there is of it the greater the snap, and bees unaccustomed to such disturbance rush out of the cluster or entrance and immediately there is poison in the air. Now, if we have the smoking wood at hand, and the smoke is blown directly upon them they at once return. Others may take their places, and if they too are disposed to resist they will throw up the abdomen so that it will not touch the next one, and press out around the sting a tiny drop of clear liquid poison so that it may be seen. All that appear and show this should have a portion of the smoke, which may be used at intervals as they appear. If all unnecessary jarring is avoided they are soon quieted. In summer, in the middle of the day when the sun shines, this propolis is pliable, and most of the manipulations can be per-

formed without a jar. If it is a movable-comb hive you can take off the boxes, take out frames, look for the queen, and be very likely not to alarm a bee. Have the smoke at hand, so that if they do accidentally get an alarm they may be at once quieted. Another thing: If it is in a season of honey, and the bees are engaged bringing it in—especially Italians—they are not often disposed to resent what at another time, a few hours earlier, might be thought a gross insult. When bees are filled with honey or syrup they are not disposed to make an attack. If you wish to train bees to make them good-natured always when practical work with them in the middle of a warm day. Work slowly; a quick motion may attract unpleasant attention. Avoid crushing a single bee. A little time gained now by quick motions may be lost in removing stings another day. If no poison has been set afloat they have nothing to anger them. It is possible, if no anger is called up, that having no use for their poison little or none may be secreted. After a few generations, at any rate, we shall have little fear to go among them and get acquainted. And when we get a few more interested seekers after their real nature we shall progress in the same ratio in pleasurable and satisfactory bee-keeping. Let us resolve to give no cause of resentment.

Ogden Farm Papers.—No. 47.

Good farming is good farming all the world over. This must be the result of the reflections of any considerate person who compares the agriculture of other countries with that of his own. The one universal purpose of the farmer is to devote the fertility of his soil and his facilities for its management to the production of such returns as will pay the largest profit in the comforts of life, in the increased value of his property, or in actual money. In seeking the accomplishment of this purpose he depends upon fundamental principles, and works in obedience to fundamental laws, which are everywhere the same. Soil and sunshine, air and water, and the never-ending combinations and changes by which they aid or retard the growth of plants—these are invariable from one end of the world to the other. Processes vary with circumstances and conditions, but the principles on which they depend are everywhere the same, and the best farming of Europe differs from the best farming of America only in details, not in general principles.

A careful observation of the agriculture of the best cultivated parts of Europe confirms the opinion formed at home that the only good farming anywhere is the very best farming that under the circumstances is possible; and that, whenever possible, *the highest kind of high farming pays the best*. It is not to be understood by this that the finest buildings, the most elaborate implements, the most costly animals, the most lavish outlay for artificial manures, are the index of good management—they are often the opposite—but that the fullest measure of success will attend the efforts of that man who, in small things as in great ones, makes the most of his circumstances, and whose ambition never stops short of the highest excellence that is within his possible reach; who is never satisfied with what he has done but is always striving to do more.

There are more of this class in Europe than in America, and herein lies its chief advantage as a school for the agricultural student. Most of the problems which interest us and form the subjects of our discussions may be better investigated there than here. In view of this I applied myself during my recent trip to the obtaining of light on the much vexed question of deep plowing, one which has always had a prominent place with our writers, and about which no definite early conclusion seems probable. It has certainly not been less

talked about and written about and quarreled about in England. When agricultural writing first commenced there it at once took a prominent position, and the columns of the British agricultural journals are to this day more taken up with it than with any other topic on which opinions differ widely. Arguments on both sides are plenty—on either side, viewed by themselves, they seem convincing—and it is at least difficult to decide which has the best of the discussion. In practice, the deep plowers find comparatively few adherents, for there as well as here it is the almost universal custom to plow only to the depth of about six inches. Personally, I have always sided with the deeper faction, and I am not now disposed entirely to abandon their position. At the same time, the more I investigate the matter the less am I inclined to urge the adoption of their recommendations. There is much force in the statement of a recent English writer that if by deep plowing you convert the upturned subsoil (by the aid of manure) into a surface soil, you by covering up the surface soil convert it into a subsoil, and place its greater fertility beyond the reach of the developing action of the atmosphere and thus lose its effect. On the other hand, there is no getting around the fact that gardeners and nurserymen have great faith in the efficiency of "trenching," a process whereby the surface soil is completely buried beneath the upturned subsoil. In their cases, however, the quantity of manure used is much greater than is possible in the larger operations of the farm.

In this matter it would certainly be safer to advise that all attempts at deep plowing be very carefully made. Many instances can be cited where it has been decidedly injurious. Ogden Farm offers one of a serious character, where nearly ten acres of land was so far injured by turning up a few inches of poor cold clay that five years' time and an expenditure of manure and labor to the value of more than the original cost of the land have been insufficient to make good the damage. Perhaps corresponding cases of benefit may be adduced, though I know of none that appeals so strongly to my judgment.

After considering the question on all sides, what should be our practical recommendation? It seems especially clear to me after a careful examination of the farming of some of the best parts of Europe. It is certainly true that, taken as a whole, the best European agriculture, like the best American agriculture, does not depend on deep plowing. The men who succeed the best, there as well as here, are generally shallow plowers rather than deep plowers. Many of them no doubt believe, theoretically, that deeper plowing would be better; but whatever their theory may be, their practice is to confine the turning of the soil to the first five or six inches, and to keep their manure near the surface. The only thing of general value that has been proved about the question after all these years of argument is that it has two sides to it, and I do not hesitate to recommend my readers to be very cautious how they enter into the discussion with their own plowshares. Study, investigate, and theorize as much as you like, but be very slow to abandon a custom that is known to be successful for one that is of uncertain promise. I do not myself desert the deep plowing party, but, on the other hand, I do not recommend its teachings for general and immediate adoption. In many cases it will do good,

but first trials should in all cases be made on a very limited scale, for on many soils it does great harm. There are channels enough open for the introduction of improved processes which will pay without question, and the laudable energy of enthusiastic men need never lack for an object. It is the safest plan to stick to the best customs of the best farmers until they fail to satisfy, and then to amend or alter them only as careful experiments shall prove the change to be a good one. The truth is that we know by far too little of the how and the why of vegetable growth to decide on the value of any improvement in advance of its actual trial. The way in which agricultural writers have been forced to abandon their recommendation for the immediate plowing under of stable manure, and to content themselves with finding out the reason why the opposite custom of farmers (to spread manure on the surface and leave it there) was better, is too fresh in mind for any prudent man to insist that deep plowing is to be or ought to be the universal panacea of agriculture, while he can count on his fingers the really successful farmers who have adopted it, or, who having once adopted it, have found it worth their while to keep it up. Of course, the expense of deep plowing has had much influence in retarding its spread, but the expense is of itself no argument against it, and it has not been taken up where (as on the larger farms of England) mere expense is no argument against any process that is sure to pay.

It was thought that the use of steam in plowing would finally decide the matter in England, and that with the increased motive power thus placed at the disposal of the farmer there would be a general deepening of the furrow. The result has been quite an opposite one—a general giving up of the furrow. Only where there is clover or grass to be turned under is the plow used at all in steam cultivation. In all stubble and fallow work (which is much more in proportion to the grass work than it is here) there is substituted for it a deep-tined grubber or cultivator which tears up and loosens the ground very thoroughly without reversing it at all. The cultivation is deep, it is true, but the top soil is kept at the top, and the subsoil is only torn asunder and loosened where it lies. This secures the great advantages of deep plowing—better drainage and better protection against drouth—without entailing the disadvantage of burying the richer surface soil away from the action of sun and air and out of the reach of surface roots. It is, in fact, more like our long advocated but too costly subsoiling, and it constitutes the most effective cultivation yet known.

As a whole, the farming of England is the best in the world. The farms are usually large, and the farmers men of intelligence and of large capital. More attention is paid there than anywhere else to the making of manure; grain is largely grown; and the system of a regular rotation of crops, to maintain the fertility of the soil, is almost universal. Over a large part of the country the cash profit of farming is secured by the sale of grain, but the fertility of the land, the ability to produce grain, is kept up by the feeding of a heavy stock of cattle or sheep, which are kept mainly for the sake of the manure they make, and which are largely fed on purchased food—in great part oil-cake and Indian corn imported

from America. Such a complete system could hardly be carried out on so large a scale on many farms in this country, for few of our farmers have the necessary capital; but it is, after all, the system toward which we should work and to which we must look for the permanent future of our agriculture. Our farming can never be perfect, nor anything like it, until we shall have reached the point of a constant improvement of the soil. A constant deterioration has been a necessary consequence of the rapid spread of population over the whole breadth of the land, but it must before long be followed by a wave of better farming, which alone can enable such a population to be self-supporting. Happily the improvement already made on farms at the East which were considered to have been exhausted, shows that the injury was not deep, and that the pioneers who have been tempted westward by a virgin soil have left behind them a fair field for the establishment of the better agriculture that an older and denser community demands and makes possible.

Surely no one could be better placed than the Eastern farmer for the extensive adoption of the system of feeding as a means for enriching the soil. He has a home demand for meat which is not likely to fail, and there is apparently no limit to the quantity that Europe can take from us. In England especially the price of all manner of food is very high, and is growing higher every year. Animal food has never been used by the laboring classes to anything like the extent to which it is with us, and the advancing price marks a constantly increasing scarcity. If we can ship our corn from Illinois to England and sell it there at a price that leaves a profit to the English feeder, we should surely do better to feed it ourselves and save the freight on the very large proportion of it which is lost in the processes of digestion. As some one has cleverly expressed it: If we can't pay freight on 20 bushels of corn from the Mississippi to Liverpool, let us pack them in a pork barrel and try it that way. Thus shall we not only save three-fourths of the freight, and clear a much better price for our crop, but we shall save to our farms the whole manurial residuum of the grain with which to grow larger crops in future.

In theory nothing could be better than such a solution of the serious difficulties under which Western farmers are now struggling. How it would work in practice (on a large scale) it is not so easy to say. There are difficulties in the matter which can hardly be computed, but if by any process it ever becomes possible to dispense with the speculators and middle-men who block the road between the Mississippi and Liverpool, so that the producer shall have no unjust tax to pay in the transfer of his products and the collection of his pay, there can be no doubt of the result. At the same time, in instituting this reform, the farmer must be careful not to reform himself out of existence. The speculator and middle-man are there because they are needed. They are not just the model that a millenarian would set up, but, such as they are, they have grown up in response to a living demand, and they are the only existing medium for the transmission of produce and money between the farmer and his final customers. Sweep them off from the face of the earth to-day and to-morrow your occupation is gone. The dairyman of the West can not peddle his own cheese in the streets of London, but London is one of his

great markets, and until he can find some better way to reach it he will gain nothing by grumbling about the present way.

Will he gain by grumbling in any case? So long as he must use the bridge, why waste breath in abusing it? If there is anything in the signs of the times, we can see a fair gleam of daybreak for the farmer in the quarter whence other classes are getting relief. It is too untried as yet for us to say how much it will really amount to, but thus far there appears no valid reason why coöperation may not be of almost unlimited value to the agricultural interest. What is needed in the transmission of produce is capital and commercial skill. By association, farmers ought to be able to secure these. At all events, the experiment may be made without very serious individual risks, and it is worth trying. Its success will depend very much on mutual confidence (a plant of slow growth in agricultural districts) and on the chance of getting agents who will work as efficiently for a moderate fixed compensation as they would under the stimulus of individual speculation. Coöperation will be sure to work well in times of high prices and great prosperity; its sore trial will come when trade is dull and when money must be lost, and the association will always have to compete with the established traders, who have a large capital at command, and who are accustomed to take heavy risks. It is no easy matter to reform the world's way of transacting its business, but by a well-sustained effort it may doubtless be done, and if the best farmers of a fertile county will make the effort, agreeing to stand by each other through thick and thin, they will have a sufficient promise of success to fully justify the attempt.

Orange Judd.

Among the many requests made by the readers of the *Agriculturist* probably none has been so frequently presented as that asking us to publish a portrait of Mr. Judd. For reasons which were no doubt satisfactory to himself, Mr. Judd has never acceded to this often repeated demand. As he is now temporarily absent, and so far away that he can know nothing of the matter, his associates have concluded to risk the displeasure of a single individual in order to gratify many thousands by the publication of the often called for portrait, which will be found upon our first page.

Thinking that a biography should not be written until the subject of it has closed his career, we shall here give only a brief sketch to include such points as may have interest to the readers of the *Agriculturist*.

Orange Judd is the son of Ozias Judd, one of the pioneer farmers of Niagara Co., N. Y., and afterwards one of the first settlers of Kansas, where he lost his life in one of the conflicts that attended the early history of that State; he was born in 1822, not far from Niagara Falls, and passed his youth and early manhood in the hard labors of what was then a farm in the "far West." Having a strong taste for the natural sciences, and his desire for an education being very strong, he almost solely through his own exertions entered and sustained himself at the Wesleyan College at Middletown, Conn., from which institution he was graduated in 1847. After completing his college course Mr. Judd entered the Chemical Laboratory of Yale College, where he devoted three years to the study

of analytical and agricultural chemistry. A few years were passed in teaching chemistry and other branches of science, and in lecturing upon agriculture, after which he, in 1853, became editor of the *American Agriculturist*, founded some years before by Messrs. R. L. & A. B. Allen. At that time agricultural journalism was, if not in its infancy, at least in a very feeble state, and editors who had a proper foundation in a scientific education were indeed rare. In entering upon his editorial career Mr. Judd not only brought great industry and untiring energy, but a thorough preparation for the work. His influence soon made itself felt in the paper, and in 1856 he became its sole proprietor. When the *Agriculturist* first came into Mr. Judd's hands one person could attend to all the subscription and advertising business, and also write the wrappers and fold and mail all the papers, a task that now requires some thirty persons for its performance. Mr. Judd brought besides editorial ability to the paper a remarkable business tact and energy. He determined in the first place to make a paper that people would want, and in the second place to let people know of it, and it is to a strict adherence to these two points that his success has been due. He from the first determined that the advertising pages should be as carefully edited as any part of the paper, and, though at great immediate pecuniary loss, excluded quackery of all kinds and all advertisements of a doubtful character. The subsequent increase of the business of the paper, to which the publication of agricultural books had been added, led to his uniting with Lucius A. Chase and Samuel Burnham, Jr., in the firm of Orange Judd & Co., and the firm has been since enlarged by the accession of C. C. North and A. P. Miller. During the early portion of his editorship of the *Agriculturist*, Mr. Judd was for several years also the agricultural editor of the New York Times. In 1862 he went to Europe, but soon returned on account of the disturbed state of the country at home. During the war he was actively engaged with the Christian and Sanitary Commissions in affording relief to the soldiers in the field, an occupation in which his health was no doubt permanently injured. In 1867 he visited Europe again, and made an extended tour. Being warmly interested in the university at which he was educated, and feeling that its facilities for teaching the branches in which he was especially interested were inadequate, he erected at his own expense a large and magnificent building for lecture rooms, museums, etc. This building, probably the most complete of its kind in the country, is now called the Orange Judd Hall of Natural Sciences. We have already alluded to Mr. Judd's great industry; he always seemed to forget that there was a limit to human powers, and until within a few years never thought it necessary to spare himself mental or bodily labor. Unwillingly yielding to the advice of others, he passed a portion of the winter of last year in recreation in Florida, and this winter he passes quietly in some part of Europe, where it is hoped he will find the rest he has so well earned. As to our portrait, we are sure that it will surprise many, as Mr. Judd has held the attention of the agricultural public for so long that those who do not know him suppose him to be gray and venerable. Being of a nervous temperament and having a very mobile countenance, he when animated by conversation looks even much younger than the portrait represents him.

The Little Chief Hare.

BY J. H. BATTY.

But little is known of the strange little animal called by miners and hunters "Concy" and "Starved Rat," and by Audubon and others the "Little Chief Hare." It is found on the highest peaks of the Rocky Mountains, far above timber line, near the perpetual snow-banks, among the immense piles of loose volcanic rocks. Its note consists of a singlesqueak, which is quickly given at short intervals. The one from which the illustration is made was shot on Long's Peak of the Rocky Mountains, Colorado, by a member of the U. S. Geological Survey under Dr. Hayden. A few stragglers were first observed on Pike's Peak. As the party advanced westward near the snow ranges the Coneys became more numerous, and on Mt. Lincoln, Elk Mountains, and in Mosquito Pass they were seen in considerable numbers. When the note of the animal is heard it appears to come from a distance, although the animal making it may be but a few yards from the hearer. The favorite resort of the Coney is on some sharp projecting rock. From that elevated position it gives its faint squeak and immediately after disappears, and suddenly is seen on another stone a few yards from its former position, uttering its note as before. The Coneys appear to be most active at the commencement of a snow squall, when their squeaks may be heard in concert from many quarters. Although they appear to be fond of the snow, they seem to be greatly in dread of the hail-storms which are frequent on the mountain tops during the summer. The little Chief Hare is 7.75 inches long. Its head is large in proportion to the body, being 2 inches long and 1.62 inches wide. The eyes are small and dark hazel, set rather deep in the head. It has two incisors above and below, those of the upper jaw being so deeply grooved, nearly their full length, as to give it the appearance of having four incisors instead of

but two. The color upon the upper surface is dark brown, with irregular bands of brownish black running transversely across the back. The under surface is yellowish gray. The very small tail is light colored. This species was discovered by both Drummond and Nuttall in

with ground on all sides, it is well suited, when modified as required, for a corner or otherwise located plot in a village or city suburb; in that case the parlor and dining-room will face the street. The aim has been to produce a pleasing structure, and one that will be interesting

THE LITTLE CHIEF HARE.

their expeditions to the Rocky Mountains, but they give but little in relation to its history.

Design for a Cottage.

The elevation and plans here presented were furnished by C. A. Vanderhooft, designer, No. 191 Broadway, with the following description:

main building being 28 x 31 feet, with parlor extension 15 x 17 feet.

The first story is ten feet and the second nine feet high in the clear. A cellar seven feet high extends under the whole building.

The staircase window is a noticeable feature, being distinctively treated exteriorly in connection with the flower-stand and attic windows and gable, and while lighting and ventilating

the halls gives, by the introduction of stained glass in the upper panels, a constant delight to the eye at a small outlay. This can be dispensed with, but its introduction, together with the wood and iron finials, crestings, etc., should be looked at in the same light as the investment in a picture—a means of making home attractive. The arrangement of dining-room, bay, and fireplace will be found agreeable, as also the alcove on second floor. The dining-room and kitchen have large closets, and a pass window is provided from the rear hall into the latter. The kitchen is separated

Fig. 1.—DESIGN FOR A COTTAGE.

The house here represented is suitable for a small family who desire a pleasant and convenient home, with some pretension to picturesque beauty, at a moderate cost, and will be found suggestive both in style and arrangements. Although designed for a special site,

is fitted up with range and hot and cold water. A wash-room can be added in the rear of the house if required, with servant's room over it.

The bedrooms are all provided with closets, and are conveniently arranged for the placing

the kitchen is separated by double doors from the rest of the house, and is fitted up with range and hot and cold water. A wash-room can be added in the rear of the house if required, with servant's room over it. The bedrooms are all provided with closets, and are conveniently arranged for the placing

of furniture. There is a servant's room in the attic, besides storage space and a tank to supply the boilers in the kitchen. A bath-room can be added by a slight change in the small bedroom, dispensing with the closets.

The main building is shingled on the second story, and covered with narrow horizontal weather-boards below, while the extension has

Fig. 2.—PLAN OF FIRST FLOOR.

vertical weather-boards under the eaves, as shown in figure 1, on the preceding page.

It is needless to repeat the mode of construction uniformly used in this class of buildings. The cost of this cottage built in the best manner, is estimated at \$5,000, depending, of

Fig. 3.—PLAN OF SECOND FLOOR.

course, on the locality and the quality of finish employed, and the specifications will necessarily be drawn up to suit the means and requirements of each individual.

Walks and Talks on the Farm.—No. 121.

The wheat in this section looked remarkably well last fall, and is gone into winter quarters in a most promising condition. The wheat crop last season throughout Western New York was the poorest we have had for several years. My own crop did not average over ten bushels per acre.

"Does it not dishearten you?" asks the Deacon, whose crop was not over five bushels per acre.

"No," I replied; "it is rather an encouraging fact than otherwise, for the simple reason that we farmers have to compete with each other. The stories that are often told about this or that farmer who scratched over a piece of land, sowed the seed, and harvested a big crop of wheat have a pernicious effect. They encourage a sort of gambling spirit among farmers.

We speculate on the seasons. We ignore science, experience, and observation. We hope for good crops without using the means necessary to secure them. It is a great evil."

"But I don't see," remarks the Deacon, "how a poor crop can afford you any encouragement."

"I will tell you, Deacon, where the point comes in. You have always contended that what is generally called 'improved farming' will not pay, that it requires too much labor; and you call attention to the fact that Mr. So-and-So raised a large crop by merely plowing his land and sowing the seed without manure. Now, of course, if this was a fair representation of the facts of the case, those of us who are endeavoring to cultivate our land more thoroughly are throwing away our time and money. We contend that there is a good and sufficient reason for these occasional big crops, and that they afford no evidence against the general agricultural law that good crops can only be produced by good farming."

Last year Ellwanger & Barry had 22 acres of choice white wheat that produced 43 bushels per acre. Meeting Mr. Ellwanger one day I asked: "What is there about that great wheat crop you raised last harvest?"

"Nothing but good culture," he replied.

"The land has been in nursery trees, and had been plowed deep and well cultivated. That is all there is about it. Farmers do not half work their land. That crop of wheat paid better these times than nursery stock."

That farmers do not half work their land is essentially true. We plow too much land, and do not work it enough to kill the weeds and put it in the best condition for the crop. I think farmers are beginning to appreciate this fact. When one farmer raises 45 bushels of barley per acre and his neighbor only 15 bushels per acre; when the former readily brings \$1.50 per bushel of 48 lbs., and the latter can be used only as food for chickens or the

pigs, and is dear at 50 cents per bushel, he is a dull man who can not see that it pays to farm well if it pays to farm at all.

"You seem to forget," says the Deacon, "that we are greatly dependent on the season. You appear to think that if we drain our land and make it clean and rich we are sure of good crops. But you ought to know better. Your Peachblow potatoes that looked so promising last summer proved to be a poor crop."

No one realizes our dependence on the weather more than I do. All I contend is that the better we farm the less likely we are to have our crops injured by drouth, insects, etc. I should have had a good crop of Peachblow potatoes if it had not been for a severe frost that completely killed the tops early in October.

"You will never raise good potatoes," remarks the Judge, "until you give up your plan of planting in drills. I always plant mine in hills 3 1/2 feet apart, just as I do corn, and I have never had a poor crop. This year I raised 125 bushels of good Peachblows from 96 square rods, or at the rate of 208 bushels per acre.

They had no manure except a handful of ashes, plaster, and hen-dung scattered on the hill."

The Judge is one of the best farmers in the neighborhood, and is particularly successful in raising good potatoes and getting good prices for them. He has customers in the city who take all he raises. I sold my potatoes this fall at 50 cents a bushel. He got 60 cents. I had three acres of Peachblows that produced about 100 bushels per acre; but there were only 75 bushels per acre of merchantable potatoes. It cost me about \$10 per acre to dig them. I presume it cost the Judge about the same. The cost and profits of the two crops would be about as follows:

Expenses per acre:		W. & T.	Judge.
Plowing, harrowing, rolling, marking, planting, and covering.....	\$ 8.00	\$ 8.00	
Seed	5.00	5.00	
Hoing, cultivating, etc.....	7.00	10.00	
Digging.....	10.00	10.00	
		30.00	33.00
Receipts per acre:			
75 bushels, @ 50c.....	37.50		
25 " @ 12 1/2c.....	3.12		
	40.62		
200 bushels, @ 60c.....		120.00	
8 " @ 12 1/2c.....		1.00	
		121.00	
Profit per acre.....	\$10.62	\$98.00	

The Judge seemed delighted with the above table. He has been complaining about high wages and low prices until he thought there was no longer any profit in farming. The Deacon recollected that his crop was no better than mine, and said nothing for some time.

The Judge remarked: "You have charged nothing for my 'guano.' That has more to do with it than you seem to think."

"Well, if we call that \$8 per acre there is still a profit of \$90 per acre."

"It did not cost half that," replied the Judge; "I prepared it myself in the winter when I had nothing else to do."

"I hope," said the Deacon, "you will own up for once that your plan of planting is a poor one."

"You planted in hills, Deacon," I replied, "and had no better crop than mine. And besides, I had in the same field with the Peachblows several rows of Early Rose, which were a good crop; and also several rows of Late Rose, which turned out wonderfully, both in quality and quantity. There was certainly over 200 bushels per acre. And yet they were planted in drills, and were treated precisely the same as the Peachblows. I suppose they had reached maturity before the frost came, while the Peachblows would have kept on growing for a month. The truth is that the Judge's potatoes were injured but little by the frost, owing to the sheltered position of the land. And I think this has far more to do with it than the manner of planting."

"J. B.," of Decorah, Iowa, writes that winter set in a month earlier than usual. The crop of corn was very poor. Hogs are numerous, and there is not corn enough to fatten them. Corn sells at from 35c. to 45c. a bushel. Hogs 3c. per pound live weight, or 3 1/2c. to 4c. dressed. Butter sold for 10c. a pound in summer, but since the drouth has advanced to 25c. per pound, and many farmers have to buy. "I was in town last Saturday," he writes, "trying to sell chickens, and all I could get offered was 10c. apiece, no matter how fat they were. I said, No; I will eat what I can, and the rest I will

winter over."—That is right. A fat chicken at ten cents and a pound of pork at four cents would not be a bad dinner after a few hours sharp work on a frosty morning.

"Steers are selling for 2c. to 2½c. per pound live weight; but," he adds, "I am sorry to say there are very few to call fat."—What is needed is a Shorthorn bull.

W. C. Cusiak, of Oregon, sends me by mail four pounds of Chili Club wheat. It is a handsome white wheat. It is usually grown as a spring wheat in eastern Oregon, but is often grown as a fall wheat in western Oregon. It came too late for me to sow last fall, and I have had poor success in raising spring wheat here. Mr. C. adds: "Farming is generally carried on here (eastern Oregon) in a slovenly manner. Grain all sown in the spring, as the ground is usually too dry to 'bring it up' in the fall. It is harvested with 'headers,' which leave all the weed-seeds on the ground. Consequently farms are running down. Land that produced 100 bushels of barley per acre ten years ago will now hardly produce 25 bushels."—This is the same old story. We must kill the weeds or give up all hopes of raising large crops of grain.

"J. H. M.," of Aaronsburg, Centre Co., Pa., writes that the general rotation in his neighborhood is: (1st) Corn on clover sod; (2d) oats; (3d) after the oats are harvested 12 tons of well-rotted manure per acre are spread on the oat-stubble and plowed in. After the oats come up the land is either plowed again or thoroughly cultivated, and is then drilled in with winter wheat. One quart of timothy seed per acre is sown in the fall and five quarts of clover in the spring on the wheat. The hay crop averages two tons per acre; corn, 90 bushels of ears; oats, 35 to 60 bushels; wheat, 20 to 30 bushels. Mr. M. asks if it would not be a good plan to fallow the land after corn instead of sowing oats. Put the manure on the fallow and sow wheat. Then sow wheat again the next fall.—As a rule I do not like the idea of sowing wheat after wheat. If the land is heavy and the oat crop uncertain, the plan of fallowing instead of sowing oats is a good one. But I would seed down with the wheat. And then, the next year or, still better, the year after, plow up the clover sod and sow wheat, seeding it down again in the spring. Or, what would suit me better, I would plow up the clover sod in July, August, or September, as most convenient, and "fall-fallow" it. And the next spring I would sow it to oats and peas mixed together, or to oats or peas alone, or to barley, and follow this crop with wheat and seed down again with clover in the spring.

"Does a crop of corn," asks a scientific friend, "impoverish the soil more than a crop of corn grown only for fodder and not allowed to go to seed?"

It is the general impression that such is the case; but I think there is little or no evidence to sustain the impression. It is thought that the production of seed draws heavily on the land. My own opinion is that the seed is elaborated from matter previously formed in the plant. It is the quantity of plant-food abstracted from the soil that impoverishes it; and, according to this idea, it would make very little difference whether this plant-food was concentrated into fruit or seed, or whether it remained in the leaves and stems of the plant. In other

words, a crop of oats cut for hay or green fodder a week or ten days before the seed was matured would impoverish the soil nearly or quite as much as if the crop was allowed to fully mature the seed.

When we allow a crop of timothy hay to get over-ripe, or, in other words, to form seed, there is probably a loss of nutriment. At any rate cows will not eat and digest this over-ripe hay as readily as they will hay that is cut before the seed is fully matured. But it is not clear to my mind that by letting the timothy go to seed you impoverish the soil. And so in growing corn for fodder I see no reason for supposing that it does not impoverish the soil nearly or quite as much as if we grew the crop for the sake of the grain.

"I don't believe any such a doctrine," remarks the Deacon. "Do you think your Northern Spy trees that produced such a grand crop of apples this year have not taken more substance out of the soil than if they had not produced fruit?"

"I suppose if they had not produced fruit they would have produced more wood. I think the roots would have taken nearly or quite as much water and plant-food out of the soil in the one case as in the other. The reason so many apple-trees bear only every other year is that during the "bearing year" the excess of fruit absorbs the material that ought to be stored up for the next crop. And this is my reason for thinning out the fruit."

"Yes, I know," says the Deacon, "but it is a good deal of work, and farmersean not spare the time to do it."

"It takes no more time to pick off a little apple in the summer than it does to pick the same apple in the fall—and with me the fall is the busiest season of the year. I got this idea from J. J. Thomas. I used to think, as you do, that thinning fruit was one of the refinements of horticulture which those of us who grow apples and peaches largely for market could not stop to bother with. But Mr. Thomas's remark above quoted convinced me of my error. If there are two thousand apples on a tree in the summer and I let them grow, I have to pick them all in the fall. If this is as many again apples as the tree ought to bear, the two thousand apples would fill say five barrels. Now, if I pick off one thousand of the smallest and poorest and specked and wormy apples in the summer, and let the sheep and pigs eat them up, the probabilities are that the thousand apples left on the tree would grow so much larger that they would fill the five barrels as before. We pick two thousand apples in either case, and get the same amount of fruit."

"What, then, do we gain?"

"In the first place, the thousand apples do not exhaust the tree as much as the two thousand. There is as much fruit by measure, but it consists largely of material that takes little from the tree or the soil. There is only half as much seed, etc. We ought to thin out at least enough to leave the tree strength enough to bear a full crop the next year. In the second place, the thousand apples are worth much more than the two thousand; and last, but not least, the trees will bear every year."

"That is all true enough, and you might put it still stronger; but do you mean to say that you can grow apples so big that two hundred fill a barrel?"

"When we were barreling our Northern Spy apples I had the curiosity to count how many

apples it took to fill a barrel heaped up ready for pressing. One of my men counted one barrel and I another. We did not select the largest, but about the average of the best fruit. My barrel took 222 apples and his 218 apples. I then told him to select out the largest apples, and we filled a barrel with 190 and another with 186 apples. The latter I headed up just as they were and sent to the editor of the *American Agriculturist*. I presume the railroad-people would do their best to bruise them before they got to the end of their 400-mile journey. [They succeeded too.—Ed.]

"An apple crop, like wheat, is a pleasant thing to have during these hard times. The money comes in a lump. I sold my apple crop all to one man, and drew them directly out of the orchard to the depot. They came to \$1,256.50. It is quite a help."

"It is so," said the Deacon. "You have no other four acres on the farm that will pay half as much. That orchard, the way you manage it, is good for a thousand barrels of apples."

I never knew the Deacon come so near paying me a compliment. I deserve no other credit than this: I had faith in good farming. I knew the Northern Spy was a very choice apple. I knew that in orchards as ordinarily managed it often failed to prove a profitable variety. Scores of farmers as they drove by have stopped and urged me to graft the orchard to Baldwins and Greenings. I said: "No. The Northern Spy is one of the best apples in the world, and of course, like all choice things, it requires the best of management. Neglect the orchard and you can not have a worse variety; treat it well, prune judiciously, and manure highly, and you can not have a better." There was a principle at stake, and I have waited patiently, and have not waited in vain. Several of the trees this year bore five barrels of the choicest fruit. I think when they get into full bearing they are, as the Deacon says, "good" for ten barrels.

I have now lived ten years on this farm, and have written "Walks and Talks" every month during this time. I feel somewhat ashamed to think how much of my purely personal matters I have presented to the public. I commenced to write without thinking; I told precisely what happened. Unfortunately, what happened proved to be largely mistakes and failures. I sent to Gregory, of Marblehead, for some seed of his best variety of onion, and sowed it on land that I should now think too poor to raise white beans and too weedy to sow to buck-wheat. You can imagine the result. My first crop of oats was eight bushels per acre, and of barley twelve bushels. Farming is slow work. I have not yet got my land anything like as clean as I want it. I keep working and hoping.—"Yes," says the Deacon, "and walking and talking."—Precisely. That is what I wanted to get at. I have told of so many disappointments and discouragements that while, as I said before, I commenced this series of articles little thinking that I should continue to write them so long, yet I do not know how to stop. I believe in farming, and feel sure that it can be made not only a pleasant but a profitable business. And if my land is getting cleaner and richer and my crops larger and more profitable I hope to be excused for saying so. I have told of my failures and the reasons for them. I want to tell of my successes—if I ever have any. I think the readers of agricultural papers do not need information so much as exhortation. What we need

is encouragement. We want to believe that good farming will pay—and it most certainly will. Or, if it does not, no other business in the community can long continue to prosper.

How Sleds are Built.

The best sled-runner is made from the butt of a tree. The grain where the root joins the butt

Fig. 1.—BUTT READY FOR SAWING.

is gnarled and twisted in such a manner that a runner cut therefrom can hardly be broken, and can not be split. But there is something in choosing the tree. Yellow birch, sugar maple, or white oak furnishes excellent wood for this purpose.

Fig. 2.—LINES TO SAW BY.

A good-sized tree with spreading roots should be selected; one which has two broad thick roots, one opposite to the other, and the stem of which suddenly thickens just above the curve of the roots, will be found the best. The main roots should be cut off a foot from the tree, and all others close to the stem; the earth should be dug

Fig. 3.—RUNNER, REVE, AND BOLT.

away from the tap roots and they should be cut. But very often it is not necessary to do this, as the tree will fall when the roots are cut all around it unless it stand very upright. The butt should be sawn off six feet long. In preparing it for sawing, it should be neatly trimmed, all earth and stones cleared from the crevices, and brought as nearly as may be

Fig. 4.—KNEE AND BENCH.

into the shape of that shown in figure 1, in which the piece is represented as fixed upon the carriage of a muley saw-mill. It is necessary that roots, as farmers often call them, taken to a mill to be sawn should be so prepared, as sawyers are otherwise averse to sawing them, often

refusing to do so, when they are useless, and the labor in cutting and hauling them lost. When properly sawn the planks, 2½ inches thick, appear as shown at figure 2, and the dotted lines there given indicate the form of the sled-runners to be cut from them. It will be seen that the waste timber at the lower part may be cut into knees, for which it is very valuable, having a grain exactly suitable for the purpose. They should be cut out so as to avoid cross-grain in any part. The runner is shown at a, figure 3, ready morticed for the knees. At b is seen the *reve*, or that piece which forms the side of the sled, resting upon the benches. This is cut to fit the point of the runner, and is secured there by a bolt passing through both parts. The *reve*, 1½ in. thick and 6 in. wide, is secured to the benches and runners by bolts passing through the shoe and runner on each side of the knees. The bolt shown at c, figure 3, is made flaring or spreading at the bottom to fit a corresponding countersunk hole in the shoe, and is secured above

Fig. 5.—CAST-IRON KNEE, ETC.

snugly, flush with the surface. At each end of the bar screws are cut and nuts and washers are made to fit it. At c is shown the method of fitting the tongue into the roller, the tongue being tenoned and wedged therein very tightly. The roller and tongue as completed is shown at d. A brace is fastened upon each side, bolted to the tongue and welded to a band which embraces the end of the roller. At e is shown a plate to be fastened to the nose of the sled, as seen in figure 7, to prevent wear by the draw-bar. In this figure (7) is seen the sled completed before the tongue is fitted into its place. If the work is not very heavy the bolts passing through the runner and *reve* may be dispensed with and light carriage bolts used to fix the *reve* to the bench.

Fig. 6.—ROLLER, ETC.

the *reve* by a nut, which when screwed down tightly is fastened by riveting the end of the bolt; or in case one of the improved lock-nut bolts described in the *Agriculturist* of November last is used, the key is driven in, which holds the nut firmly. The form of the knee is shown at a in figure 4, and the bench at b. The joints of these parts should be made very close; each one be slightly draw-bored, and a bolt passed through each riveted at the end over a washer. The better these joints are made the longer the sled will last, as it is in these parts it first gives out. If the tenons are dipped in linseed oil when they are driven in the mortice, and the mortice also is painted over with the oil, it will add very much to the durability of the sled. At figure 5 is shown a new and very valuable invention—a cast-iron sled knee. It is patented and made by the Bradley Manufacturing Company of Syracuse,

Fig. 7.—THE SLED PUT TOGETHER.

N. Y. This is a decided improvement, and one that will add much to the value of the

sleds in which they are used, and considerably reduce the cost. There are no mortices to be made, and it will be seen that there is no place in which wet or moisture can gather and rot the runner. Besides, by using these knees, almost any person can build a sled, while it needs at least a fair mechanic to build one with the ordinary knees. The cast-iron knee is shown at a, the runner at b, the beam or bench at c, and at d the bolt which binds the whole together. The form of the roller is shown at a, fig. 6. This should be made of a straight-grained piece of hard maple or birch timber, 6 in. wide by 4 in. thick, reduced to the shape here shown. A mortise is made through the center to receive the end of the tongue. Holes are bored from the center of each end, running out at the middle of the roller in which the draw-bar b is placed. A channel is dug out at the middle of the roller in which the bar lies

Fig. 1.—MR. CURTIS'S PIG-TROUGH.

snugly, flush with the surface. At each end of the bar screws are cut and nuts and washers are made to fit it. At c is shown the method of fitting the tongue into the roller, the tongue being tenoned and wedged therein very tightly. The roller and tongue as completed is shown at d. A brace is fastened upon each side, bolted to the tongue and welded to a band which embraces the end of the roller. At e is shown a plate to be fastened to the nose of the sled, as seen in figure 7, to prevent wear by the draw-bar. In this figure (7) is seen the sled completed before the tongue is fitted into its place. If the work is not very heavy the bolts passing through the runner and *reve* may be dispensed with and light carriage bolts used to fix the *reve* to the bench.

Cooking Room for Pig-Pen.

In the *Agriculturist* of December, 1873, we described an improved pig-pen. We here give

Fig. 2.—FEED BARROW.

an engraving (figure 3) of an arrangement for cooking the feed suitable for such a pen as that referred to. The room should be fitted at one end of the row of pens, unless that is too long, in which case it would be better to have it in the middle. The boiler is of cast-iron, and is built around with brick; underneath it is the fireplace and ash-pit, from which a flue or smoke-pipe passes into the chimney. This is a very convenient and economical arrangement for preparing food when it is desired only to scald it and allow it to soak and swell. For cooking whole grain or potatoes or roots it

will be found very desirable and economical in the consumption of fuel. With such a boiler we would not attempt to boil the food for any length of time, but after bringing it to the boiling point we would simply maintain it

Fig. 3.—BOILER FOR COOKING FEED.

there as nearly as possible by covering up the boiler and allowing the feed to soak. Cooked in this way whole grain may be fed as economically as if ground, and the cost of grinding which is saved will more than pay for the cost of cooking. The feed barrow (figure 2) is adapted for using cooked food. It is a barrel or a barrel-shaped tank hung upon a bent axle and a pair of wheels. It is furnished with a spout or lip and handles, by which it may be tilted and the feed poured into the troughs.

Figure 1 represents an ingenious and indestructible pig-trough, invented by Mr. F. D. Curtis, the very active and enterprising vice-president of the New York State Agricultural Society, for use in his pig-pens. It is made of cast-iron of the thickness of stove plate, weighs about 100 pounds, and costs about five or six cents a pound. It is not patented, and any person may have it made at any foundry. The feet upon which it stands are either cast or may be made of bent strap iron and attached to the trough by a few screws or rivets.

A Barn Cistern.

"A Subscriber" may construct an elevated

A CISTERN FOR BARN.

barn cistern without difficulty and at moderate cost in the following manner: A frame of stout

timber, proportioned to the size of the cistern and the weight of its contents (10 × 10 oak timber would be suitable for one 12 feet square), is constructed either in the corner of the barn itself or outside of it at one corner; the southwest corner being preferable as being most sheltered from the cold and most exposed to the sun. This frame should be large and high enough to answer for the cooking room for the feed. Above it is built the frame of the cistern, which consists of three cross sills, two end sills, and eight posts; that is one at each corner and one in the middle at each side. These posts are framed into the four cap-pieces and the whole is strongly pinned together. The floor and sides are made of tongued and grooved plank two inches thick. Each joint is smeared with pine-tar when it is put together, and the corners are especially well fitted and caulked. When the cistern is put together the sides are made to fit closely by means of wedges driven between the edges of the upper planks and the cap-pieces. This is shown in the above engraving. A triangular-shaped piece of scantling should finally be nailed in each corner, fitting closely in its place. A cistern 12 feet square and 8 feet deep will hold about 250 barrels or 8,600 gallons. The frame of the cistern should be made at least two inches smaller each way than the frame of the room below. Then the whole is boarded up and a tight roof built over it. If the room below is used for a cook room the waste heat and steam from the boiler will ascend and pass around between the walls of the cistern, the outside boarding, and gather or escape at the roof. This will enable the cistern to be kept in use during the winter without freezing, except in localities where the cold is very intense, in which cases it would not be judicious to use it at that season. The pipe from the cistern passes through the bottom. The waste pipe from the top should pass into a drain below, and the gutters from the barn, of course, should lead into the cistern beneath the roof. A cistern of this character is well adapted for use along with the cooking arrangement described in another article. On the whole, we would prefer the cistern to an underground one in which a pump must be used.

Two Useful Instruments.

The accompanying engravings represent two very useful although common-place instruments. Fig. 1 is an improved rubber designed to take the place of the currycomb. To many horses the use of the currycomb is a very painful infliction, and after all it does not serve the purpose intended so well as it ought to do. This improved rubber will answer all the good purposes of the currycomb without possessing any of its evil qualities. If used against the direction of the hair it will loosen and remove dust and scurf very effectively, and the friction will be agreeable and healthful to the skin. It is patented, but sold at the reasonable price of 25 cents. Fig. 2 represents a very convenient brush which will be found useful in the stable for the purposes for which the stiff and unne-

Fig. 1.—RUBBER.

cessarily rigid wire card is now employed. It is less harsh to the skin of the horse than the card, and will clean equally well. Being made

Fig. 2.—RATTAN BRUSH.

of split rattan it is flexible and fits the hand easily, and is not softened by water nor will it wear away rapidly. It is sold in the stores for 15 cents. It will be found a very efficient scrubbing brush for the kitchen.

Kiln-Drying Corn.

By a small expenditure of labor and fuel corn may be made ready for market or the mill in a few days after it is husked. For this pur-

CRIB ARRANGED AS A KILN.

pose we have used the contrivance figured in the annexed engraving. The bottom of the crib was made with two sloping lathed sides, instead of being of boards and flat, as has been previously described in the *Agriculturist* (September, 1871), and which in itself very much aids the drying of the corn. The space below the crib was closed in by nailing boards upon the posts, and a common sheet-iron stove was put into it. In a week, with the expenditure of a quarter of a cord of fire-wood, a crib of corn of 800 bushels was made sufficiently dry for grinding. Upon our suggestion a neighbor who had watched the process above described made a rough crib of boards and rails of a somewhat similar shape to that in the engraving, in which he dried 2,000 bushels of corn ready for market in two weeks, keeping the fire going only during the daytime. The advantage of this process of kiln-drying is that the corn is ready for sale long before it would otherwise be, and can be shelled and turned into cash much sooner, which is very often a great convenience to the farmer never or rarely overburdened with funds.

COTTON-SEED CAKE MEAL.—Dr. Voelcker recommends as a feed for fattening stock in summer a mixture of three parts of corn-meal with one part of hulled cotton-seed cake meal

finely ground, and in winter two parts of corn-meal with one part of the cake meal. When fed alone the cake meal has been found to contain too large a proportion of nitrogenous matter for the health of either cattle or sheep, but when mixed in the above proportions the corn helps to dilute the cotton-seed and render it digestible and healthful. For sheep a daily feed, of half a pound per day, has been found very useful, especially when a flock is pastured upon dry, poor pastures; but it is very necessary that an abundant supply of drinking water be provided for them.

What Crops Leave in the Soil.

Amid the weariness of all that is written about what crops take from the soil, of how they rob it of the ability to produce succeeding crops, it will be a relief to look at the other side of the question and consider what they leave in the soil, and how they add to its future producing power.

The following is a statement of the results of instructive experiments made in 1869 at the experimental agricultural station of Proskau, in Germany, by Doctors Weiske & Werner. They selected given areas in different places in each of several fields in which various crops had been grown. These they dug out to the depth of ten inches, carefully washing out the soil, and weighing and analyzing the stubble and roots remaining. The following table shows the figures, calculated in English pounds, per English acre:

STUBBLE AND ROOTS REMAINING AFTER HARVEST.

	Total Dry Substance.	Organic Matter.	Ash.	Nitrogen.	Potash.	Phosphoric Acid.
Lucerne.....	9702	8498	1204	137	37	40
Red Clover.....	8953	7026	1927	193	82	75
Sainfoin.....	5952	4925	1027	124	48	30
Peas.....	3234	2569	674	57	11	15
Buckwheat.....	2203	1736	467	48	9	11
Rye.....	5283	3630	1653	66	32	26
Wheat.....	3490	2396	1094	24	19	12
Oats.....	3792	2343	1449	27	25	30
Barley.....	1999	1617	382	23	10	12

These figures, relating to a single experiment, are, of course, of only general value; at the same time they are, in a general way, very useful. They show, for instance, that the more delicate-rooted grain crops leave comparatively little residue in the soil—barley less than 2/5, as much as rye, and only about 1/5, as much as red clover, which, in return for its few quarts of seed, after having yielded an abundant crop, leaves for the enriching of the soil about 4 1/2 tons of root and stubble. Nor is the total amount of material left in the soil of more consequence than the quantity of particular elements? Red clover leaves 193 lbs. of nitrogen, while wheat leaves only 24 lbs. The former leaves more than four times as much potash and more than six times as much phosphoric acid as the latter.

These comparisons sufficiently explain the great and well-known value of clover as a preparatory crop for wheat and for all other crops which are not manured with nitrogen, potash, and phosphates. In the field on which this examination was made, the clover of an acre left nitrogen enough for 116 bushels of wheat, phosphoric acid enough for 114 bushels, and potash enough for 73 bushels. It should be remembered, too, that most of this material is left in the best possible condition for use—as a part of readily decaying roots well distributed

through the soil and penetrating it to a considerable depth. Indeed, particularly in the case of the clover, there would be a very considerable amount of root below the ten inches, to which only the investigation was carried.

Whether (as is unknown) the nitrogen of the clover comes wholly or partly from the soil or from the air, it is certainly taken from a condition in which it is of little use to most crops, and is converted to an available one; so that, practically, the clover is a creator of nitrogen in the soil, as it is an efficient purveyor of its latent supplies of potash and phosphoric acid.

Root crops were not included in the examination, but it is well known that they leave in the soil only a few fibrous roots, which can add but little to its stock of fertility; and experience teaches that, of all our crops, roots (unless fed off upon the land) are the most exhausting. A corresponding result would be found to obtain in the case of Indian corn. In fact, the value of any crop to the crop which follows it is found in practice to be very nearly what the above table would indicate, except in the case of oats, which injure the soil by mechanical action, their roots "clodding" the ground into lumps. This crop is more deleterious than barley, although leaving more residuum in the soil.

A Cover for Corn-Cribs.

It is not probable that corn will long remain at its present low price. It may soon be the case that it will be worth caring for and preserving from the weather. A vast quantity is destroyed or badly damaged by being exposed in open cribs to the rains and snows of the winter and spring. A simple and very cheap method of protecting the log or rail crib in

Fig. 1.—BOARD RAFTER.

common use in the Western States occurred to us as we saw hundreds of them filled with corn soaking in the heavy rains of last spring. We would take two boards six feet long and fasten them together at the end by leather or iron strap hinges, as shown in the engraving (fig. 1). These should then be laid across the corn, which is to be heaped up into the center of the crib; as many pairs of these boards being used

Fig. 2.—COVER FOR CORN-CRIB.

as may be necessary for the length of the crib, or two pairs for each length of boards, whether that be 12 feet or 16 feet, or less. Then boards

are tacked lengthwise of the crib, upon those hinged together, and which serve the purpose of rafters, commencing at the lower part, and making each board overlap the preceding one two inches or thereabouts. The nails should be only partly driven in, leaving the head projecting a little, so that when the cover is to be taken away the nails are easily drawn out with a claw-hammer. Figure 2 shows a log-crib covered in this manner. It will, of course, be necessary to stay the cover by some means so that it may not be blown off by heavy winds.

Timber Tongs.

The annexed engraving represents an implement for handling heavy timbers, or by altering the shape somewhat it may be made very

TIMBER TONGS.

useful in picking up large stones which might otherwise be difficult to handle. It should be made of three-quarter inch iron bar flattened out where the tongs are pivoted together and also at the jaws. The points of the jaws should be steeled, and brought to a sharp flat point beveled on the lower side, so as to grip the timber or stone without slipping. Two pairs of these tongs would be found very useful on a farm for picking up and carrying fence-posts, timber, or stone, or in taking hold of old posts when they are to be drawn out of the ground. For use in saw-mills they will be found especially handy, and those of our readers who are engaged in country saw-mills will find them, once used, to be indispensable.

Steam on the Canal.

So far as engineering difficulties are concerned the experiments of steam carriage upon the Erie Canal have been crowned with success. It only remains now to adapt the capacity of the canal to the new method of propelling canal boats, and make such changes as shall permit the new system to become inaugurated without interference with old and conflicting interests, to immediately increase four-fold the usefulness of this outlet for the products of the West. As it has been found as the result of the recent experiments that a steam-propelled boat can make the trip in half the time required for a horse boat, and that the cost per day is reduced one-half, it is very clear that the usefulness of the canal is quadrupled.

The *City of New York* is the name of the new boat which has accomplished this result. She is 98 ft. long by 17 ft. 4 in. in width and 9 ft. 9 in. depth of hold, and carries 220 tons or 7,000 bushels of grain. She has an engine of the best modern construction, and her consumption of coal is only 17 pounds for each mile traversed. Her trial trip from Buffalo to New York occupied less than eight days, with 36 hours lost by detentions exclusive of time spent in the locks. Her speed for the entire trip was over 3 1/4 miles per hour, or more than double that of the ordinary boat. The cost of her trip amounted to 17 1/2 cents per mile, which is about half that of the present horse boat. There are also other items of saving of expense,

such as towage upon the river and at New York; and in addition, as the boat may be of service after the canals are closed, the expense of her annual maintenance need not be condensed into the actual season of work upon the canals. It may be that there are still further improvements possible in this link of Western transportation; but if nothing further is achieved the cost of transit for a bushel of grain between the foot of lake transportation and the head of sea transportation may doubtless be reduced 75 per cent, and by so much the Western farmer's pocket will be enriched.

When to Flow Cranberries to Kill Worms.

We have received the following statement from a gentleman who has a plantation of cranberries at Thom's River, N. J., which, as it contains the record of a common error and consequent failure, will be interesting to many of our readers: "I cleared up eight acres of swamp five years ago, built two dams, carefully cultivated, and in due time the vines covered the marsh, and last June the blooms literally covered the vines, giving promise of richly rewarding me for all my labor. I saw some indications of the worms webbing the vines on the 4th of July. I immediately stopped the water on the upper piece for 24 hours, and then let it on to the lower the same length of time; but a short time after I perceived that what the worms had not destroyed the blight from some unknown cause had. So I only got 17 barrels where I should have had 200 at least. The worm looks like an apple-worm, and webs the tops of the vines together and kills leaves and blooms. I perceived some of them this fall as I was cleaning them out. How would it do to hold the water on the vines until May 15th, and then flood them once a week for twelve hours until June 15th, and then flood them twice a week until July 15th?"

This vine worm of which our correspondent speaks is the "*Tortrix vaccinivorana*, or the Cranberry-destroying Leaf-roller," so called by Dr. Packard in his work, Guide to the Study of Insects. It feeds naturally upon the huckleberry, and possibly upon other members of the heath family, and for this reason it is exceedingly desirable that huckleberry brush should be cleaned up and destroyed in the vicinity of a cranberry bog. The insect is known under the various names of "Web-worm," from the web which it spins, the "Fire-worm," from its destructive effect upon the vines, and "Vine-worm." The parent of this worm is a small cream-colored moth without any distinct markings. When at rest it is about one-fourth of an inch in length, and expands about one-half an inch. The moth survives the winter, finding shelter upon the vines and under the bark of trees, in bunches of weeds and grass, and especially in turf fences such as are often left around the borders of cranberry plantations. The moths which survive the winter mate and deposit their eggs on the leaves of the cranberry vines from the middle of April to the 1st of May. In a week or ten days the eggs hatch, and the worms begin to feed on the under side of the leaves. In a few days more they begin to make their web and draw the tops of the vines together. It feeds for about three weeks, becomes a chrysalis, and by the tenth of June a moth appears, and after a few weeks spent in mating and lay-

ing eggs a second generation of the larvæ appears about the second week of July. When the season is favorable, and there is no hindrance to their work, they will very soon destroy that portion of the cranberry meadow which they attack. The remedy for this pest is seasonable flowage, which our correspondent seems to have neglected. In the first place, the banks of the cranberry meadow should be cleaned of all brush, trees, and turf fences in which the moths can find lodging during the winter. Then the vines should be flowed to a depth of thirty inches from the 1st of November to the 10th of May. This will make sure of the destruction of all moths that may have taken refuge in the vines in the fall, and prevent the depositing of the first brood of eggs. It is a good thing for the vines to have the benefit of the sun for two or three weeks in May. Then about the 25th of May the water should be put on again and kept on for five or six days. This will destroy the second brood of eggs if any moths should come in from the neighboring brush or vines to lay them. If these two broods of worms are destroyed there is not much danger for the rest of the season, and we are inclined to think the water after the 1st of July does more harm than good. While the vines are in bloom and the young fruit is setting the water must be injurious. It is settled in the experience of our best cultivators that water is a complete remedy for this pest, where the flowage is entire and no other plant-food for the insect is allowed to grow near. But if a part of the bog remains uncovered, and the moths find a refuge, they will not only hold their own, but make inroads upon the part that is flowed. The blight of which our correspondent speaks is either the result of his mid-summer flowing, or, more likely, the scald, which is the greatest trouble now with the New Jersey cultivators, and which seems to be imperfectly understood. It is the special affliction of new plantations. After the ground is completely covered with vines there is much less of this difficulty.

American Potatoes in England.

The attitude of the English in regard to our American varieties of potatoes is something that quite passes our comprehension. They are written down as absolutely worthless, and yet the prize lots at the exhibitions consist largely of American sorts. Writers for the English press condemn the varieties over their own signatures, and the very same men write to our dealers for prices by the large quantity. We say we do not understand it, as we dislike to think that national prejudice can have any influence in so important a matter. The question of the excellence of some, at least, of our varieties of potato would seem to be effectually set at rest. Last fall Messrs. B. K. Bliss & Sons sent a collection of our potatoes to Dr. M. T. Masters, editor of the Gardeners' Chronicle. Upon October 7th that gentleman wrote to the Messrs. Bliss as follows:

"Last year you were good enough to send us for trial some of your new kinds of potatoes. As a large trial of over 300 sorts was projected to be carried out at the Royal Horticultural Society's garden at Chiswick this season, I thought the fairest way would be to send your samples to be tried with the rest. I sent them under numbers, so that no one but myself knew either the names of the varieties or the

senders. I have now the pleasure of telling you that a first-class certificate was awarded by the judges to your *Extra Early Vermont* and to *Vermont Beauty*. No doubt you will obtain official notice of this ere long; meanwhile, I thought you would like to know how much appreciated your potatoes were."

This certainly is a fair test, and should put a stop to the depreciation of American varieties in the lump. We may add that the "Vermont Beauty" has not yet been put in the market; we understand it is to bear the name of "Brownell's Beauty." It is a potato of excellent quality, and the handsomest one we ever saw.

Two Crops at Once.

BY PETER HENDERSON.

There is always some new idea coming up in the cultivation of the soil, originating frequently by accident, and quite often by those who have not made the work of the farm or garden the study of their lives. A case of this kind came under my observation last week, wherein a gentleman living in the upper part of New York Island, and cultivating but a small garden patch behind his house, discovered that to utilize his small space he could sow his "Little Gem" peas, and carrots, beets, or parsnips at the same time—in fact, in the same row, two feet apart. The peas, of course, came up boldly, seemingly leaving the more tardy root seeds so far behind that they would be no more seen. Not so, however, for soon as the peas were matured for use, clustering among the stems came the feeble seedlings of this second crop. The "straw" of the pea crop was carefully removed on a cloudy day, so as not to have the sun burn up the then unshaded seedlings of the root crop. A few days' exposure to sun and air, and they were thinned out to the usual distance of three or four inches, and by fall the crops of carrots, beets, or parsnips were just as good as if they had had the space entirely to themselves, or that the first crop of peas had not been taken. Market gardeners, who usually occupy valuable land, are obliged to resort to every possible expedient to keep the land earning something all the time, and they make it produce two and often three crops in a year.

Native Races of Sheep.

As a general rule, the sheep that we have imported hither from England have not been found to thrive. The pure-bred races of Leicester, Lincoln, Cotswold, and South-Down which have been imported have, with few exceptions, deteriorated. The greatest number of exceptions have occurred with the South-Downs, and the Leicesters have been, we believe, in every case complete failures. The English method of close breeding and high feeding is perhaps somewhat to blame for these unsatisfactory results, but the difference between the climates of that country and this is one very sufficient cause, and another is the difference between the two methods of feeding. The first difficulty, that of climate, is insuperable. The second, that of feeding, is also so in a great measure, because that depends upon the crops we raise for feed, and our crops are a necessity of our climate. But no country in the world has better opportunities of raising in a few years such varieties of sheep as are suitable to our climate from the material at hand in the most suitable

[COPYRIGHT SECURED.]

BULL BEACON COMET.—PROPERTY OF WM. CROZIER, ESQ.—*Drawn from Life and Engraved for the American Agriculturist.*

of the foreign breeds than we have. We are fast becoming mutton-eaters, and would consume much more were that sold in our markets worthy the name of mutton. We can produce fat, but meat is what is wanted. Thin Leicester or Cotswold mutton is not inviting, and when fat it is not desirable. Yet we have produced some very fair grades of these varieties upon common native sheep in which there is some merino blood, which have made very passable mutton. We think it is unquestionable that within reach of the great Eastern meat markets it would pay farmers to devote their attention to producing a class of sheep which should give a carcass of 100 pounds without being overloaded with fat, instead of the wretched mutton which now mostly comes to market weighing about 10 or 12 pounds or less per quarter. Grades of the English Downs—South-Downs, Hampshire and Shropshire Downs—sheep with black or smutty faces and hardy constitutions, with medium wool closely packed upon the body and impenetrable by rain or snow, and therefore affording that protection the want of which in the long-wool sheep is a serious and a damaging objection to them; and, most important of all, producing a sweet-flavored, juicy, and acceptable mutton. These are the sheep which furnish the best foundation upon which to build up a race of American sheep able to live upon our comparatively scanty pastures and withstand our summer heats and winter colds. But whatever race of sheep our farmers select as the basis of their flocks, we can never produce highly-flavored mutton nor full-fleshed

sheep without the aid of roots and crops of rape, tares, and clover for forage. Corn will make fat, but not meat, nor does it make an even stapled, sound, or lustrous wool; and in endeavoring to raise sheep upon dry, bare pastures and corn is precisely where we fail.

Polled Cattle Herd-Book.

The breeders of Norfolk and Suffolk red polled cattle in England, we read, recently met for the purpose of establishing a herd-book for that class of stock. A standard description was agreed upon, a committee of revision was appointed, and it was resolved to ask the assent of the various agricultural associations and cattle clubs to the standard adopted. This standard is as follows: A superior animal must be of a deep red, with udders of the same color; nose not dark or cloudy; tail may be white at the tip. Form: a neat head and throat; a full eye; a tuft of hair or crest should hang over the poll; the frontal bones should contract somewhat above the eyes and terminate in a narrow prominence at the poll or summit of the head. An imperfect standard includes those having the belly or the udder white, but no semblance of a horn can be admitted. Animals answering to this standard, which were in existence on January 1st, 1873, may be entered in the first issue of the herd-book. This, then, is the way in which an English herd-book is proposed to be established. The necessity for any inquiry into the history of the animals to be entered seems to

be ignored. Thus an accidental polled animal, if of the right color, may gain entry, although its sire or dam may have been horned. We have raised exactly such an animal as would have met every requirement of a superior polled cow mentioned in this standard, whose sire was a grade Shorthorn and whose dam was a black native cow. Such a cow, it seems, would be admitted into this herd-book as a thorough-bred red polled cow without question. As we have a direct interest in this matter, growing out of probable importations of this stock into the United States, we caution our farmers to put no faith in such a registry as this, and not to be led into supposing that an imported herd-book red polled cow or bull will mean any more than a red, hornless animal.

Beacon Comet 8th.

The above engraving is a portrait from life of the fine young Jersey bull "Beacon Comet 8th," the property of Mr. Wm. Crozier of Beacon Stock Farm, Northport, L. I. He is a descendant of Beacon Comet, and inherits the good qualities of his sire in a remarkable degree. One of his most striking peculiarities is his marking, which consists of beautiful dappled spots placed very symmetrically in almost regular lines from his back down his sides. His skin is very fine and mellow, and his handling is especially good. For want of space we are obliged to give some items relating to his history and performances in our "Basket" columns; to which we refer our readers.

Indian Tobacco—Lobelia.

There are in this country more than a dozen species of Lobelia. Some of them, like the Cardinal-flower, are conspicuous, while others

upon this point are needed. The name Lobelia was given to the genus in honor of a Flemish herbalist, De l'Obel. Some of the quack doctors, thinking it means *low*-belia, give to the tall-growing Cardinal-flower (*Lobelia cardin-*

to the Gulf, there are found five other species, some of them generally distributed and others quite local. All these species have in common with the northern one tubular leaves, but they vary much in size and form. The leaf consists

INDIAN TOBACCO.—(*Lobelia inflata*.)

DRUMMOND'S PITCHER PLANT.—(*Sarracenia Drummondii*.)

are not at all showy. Several of the exotic species are among the valued plants of our gardens and greenhouses. The one here figured, *Lobelia inflata*, or Indian Tobacco, is on account of its active properties perhaps more common than any of the others, and is generally known as Lobelia. It is a much branched plant, common in fields, and has such small blue flowers that it is not likely to attract much notice. When the seeds begin to ripen the pod swells so that it and its inclosing calyx have a bladdery or blown-up appearance, which gave rise to the specific name *inflata*. This species possesses powerful medicinal properties, it being in large doses actively emetic and narcotic. It is used by physicians, and has long been one of the unsafe agents in the hands of quacks. Its activity is such that it should only be employed when prescribed by a physician. It is of interest to the farmer as being one of the several plants to which the "slaving" of horses is attributed. Being quite common in pastures, especially in autumn, it is readily accessible to horses; but we have no positive proof that they ever eat it, and observations

alis) the distinguishing name of *high*-belia. It is one of the easily determined plants, on account of the inflated character of its seed vessels, and one can easily recognize it from our engraving. It is an annual or biennial, growing from a foot to eighteen inches high, and found in late summer throughout most of the United States.

Southern Pitcher-Plants.

In the Northern States we have one species of Pitcher-plant which extends into Canada and Newfoundland and west to Minnesota. It was the first species described, and in honor of a French Canadian physician, Sarrazin, was named *Sarracenia*, with the specific name *purpurea*. This species is a well-known inhabitant of bogs and swampy places, and is sure to attract attention by its cluster of nearly prostrate tubular leaves and its curiously shaped flowers. It was figured in this paper in May, 1866. Besides the common name of Pitcher-plant, it is in different localities called Side-saddle Flower, Huntsman's-cup, and Whip-poor-Will's Shoe. In the Southern Atlantic States, from Virginia

of a long narrow funnel, the "pitcher," closed below and open above. Along one side of the funnel runs a longitudinal projection or wing, and at the orifice, upon the side opposite to the wing, is an appendage which is sometimes called the lid of the pitcher, but it is more correctly a hood. This is an usual form for a leaf to assume, and in comparing it with ordinary leaves the botanist considers these pitchers to represent a leaf with an enormously broad leaf-stalk, which is folded together with the edges united to form the funnel or tube, and the wing before mentioned represents, so to speak, the seam. The blade, which in most leaves forms the largest portion, is here very small, and represented by the appendage or hood at the top of the pitcher. The pitchers, at least the older ones, are usually partly full of water, in which are drowned multitudes of dead insects. In most species, if not in all, the water is not a secretion of the plant, but is collected from rains; but of what service is this or the dead insects to the plant is not quite satisfactorily made out. It is but reasonable to suppose that the plants have need of the in-

sects, else there would not be such an admirable trap for catching them and a supply of water for killing them when caught. Experiments have shown that the Venus Fly-trap actually feeds upon the insects it catches, and does not refuse a diet of beef; and observations upon the Pitcher-plants may show that the insects caught by them contribute to their nourishment. The interior surface of the pitchers of all the species is furnished with sharp hairs pointing downward; near the opening, in some species, at least, there is a sugary exudation which attracts the insects, which, if they go down the tube for water or fall in, find their return much obstructed by the bristly hairs.

To enumerate the southern species of Pitcher-plant, there is the Parrot-beaked *S. Psittacina*, a somewhat smaller species than ours, and, like that, has spreading leaves, the hood to which bends over the opening and has somewhat the appearance of a parrot's bill. The pitcher in this is more nearly covered or closed than in any other species; this, like our *S. purpurea*, has red flowers, as has *S. rubra*, the Red Pitcher-plant. This is one of the rarest, and has erect slender, tubular leaves 10 to 18 inches long and handsomely veined with purple. There are two yellow-flowered species, *S. flava*, commonly called "Trumpets," and the "Spotted Trumpet-leaf," *S. variegata*. The last named has erect leaves about the same length of those of *S. rubra*, and curiously marked with white spots on the back near the top. *S. flava*, or Trumpets, is the largest of all the species, it not being rare to find the trumpet-shaped leaves three feet in length; its flowers, on stems as long as the leaves, are four or five inches across. This is found as far north as Virginia, and in some places grows in great abundance. In traveling through North Carolina we have seen immense quantities growing upon each side of the railroad, forming an interesting and conspicuous object. The most

reduced in size of course, from plants we raised from some roots kindly furnished by a friend at Apalachicola, Fla., near which city it was first discovered by Drummond in 1835. Our native Pitcher-plants, although not quite so wonderful as those of the East Indies, which belong to a different genus, *Nepenthes* (see article on Mr. Such's establishment last month), are all worthy of cultivation. Our common *S. purpurea* is, of course, perfectly hardy, and, like the rest, must have a plenty of water. A handsome clump of it placed in a vase filled with moss makes a charming ornament for a room. The southern species are usually cultivated in hot-houses, but we have found no difficulty in growing them (two of them at least, *S. flava* and *S. Drummondii*) in the open air. The roots were planted in boxes (being less apt to dry out than pots) filled with a mixture of peat, chopped sphagnum moss, and sand. The boxes were placed near the cistern, where they would be sure to be kept quite wet. Late in autumn the boxes were removed to the cellar and looked to now and then to see that the soil did not become very dry.

The Cold Grapery.

BY PETER HENDERSON.

Our climate is particularly well adapted to the cultivation of vines under glass without fire heat, and the wonder is that cold graperies are not in more general use even by people of moderate means than they at present are. We built one for our own use three years ago on the plan shown in the engraving. The dimensions are 50 feet long by 25 wide. It is finished in very good style, and cost but little more than \$1,000. It was planted in June, 1871, and last season we cut upwards of 300 lbs. of fruit from it; next season it will probably yield double that quantity. The "border,"

an inch to a foot, so that thorough and rapid drainage would be sure to be attained. At the extremity of each border a drain was built to carry off the water. The whole bottom was then cemented over so as to prevent the roots getting into the subsoil. This pit was then filled up to the depth of about two feet (four inches being allowed for settling) with a compost which was previously prepared by mixing about three parts of turf top spit from rather a shaly pasture, one part of rotten stable manure, and one part of lime rubbish. The vines were planted in the border outside, the tops being drawn inside through openings left for the purpose. The plants were strong one-year-old vines, and were set about June 1st. By October they had grown to over 20 feet in length. The varieties used were nine-tenths Black Hamburg, with a few Muscats and Frontignacs, which have done exceedingly well.

In November they were cut back to the bottom of the rafter, or about three feet from the ground, and quickly reached the top again the second year, with firm, well-ripened wood. In November they were again pruned back to about three feet above the foot of the rafter, or six feet from the ground. On this shoot was produced the fruit referred to this year (the third from the time of planting). We are just pruning now (the middle of November), and are cutting the shoot back to about four feet from top of the rafter, or about sixteen feet from the ground.

Every December we lay the vines down along the front wall after being pruned, covering them completely up with soil until May, when they are then taken up and tied to the wires, which are $\frac{1}{16}$ galvanized iron, and run across the rafters 15 inches apart and 15 inches from the glass. The training followed is what is called the "spur" system, which is simply to allow one cane or shoot to each rafter (or at three feet apart), and pruning the side shoots or "bearing wood" annually back to one eye. In the summer treatment of the cold grapery the principle must never be lost sight of that to keep the vines in perfect health a temperature of not less than 70° at night with 10° or 15° higher during the day is always necessary. Any rapid variation downward is certain to result in mildew. The floor of the grapery should be kept dashed with water at all times, unless in damp weather, from the time the buds start in May until the fruit begins to ripen in September, except during the period the vines are in flower, when it should be dispensed with until the fruit is set. If the weather is dry copious watering is necessary for the border outside. The summer pruning of the grapery consists simply in pinching off the laterals or side shoots to one eye or bud. Every winter three inches of the best well-rotted stable manure is spread over the border, and over that six inches of leaves or litter; the leaves or litter is raked off in spring, and the manure is forked in, the object being to feed the roots from the top of the border. This same treatment we give our hardy grapes with excellent results.

I am a good deal of a utilitarian, and am very apt to make even my luxuries "pay" when it is practicable to do so; and though we would hardly dream of selling our grapes that have been grown for private use, yet I do not scruple to make the glass that shelters them do

ELEVATION OF GRAPERY, SHOWING END AND PART OF SIDE.

beautiful, so far as the leaves are concerned, and one of the rarest, is Drummond's Pitcher-plant, *Sarracenia Drummondii*. The leaf is about two feet long, funnel-shaped, the rounded blade or hood erect. The upper part of the leaf is white and beautifully netted with conspicuous purple veins. The flower is purple. We give an illustration of this species, much

the proper making of which is of great importance, was begun by excavating the natural soil to the depth of 20 inches for 15 feet in width of the length of the grapery on each side. The inside was left untouched, the borders being entirely outside. The bottom of the excavation was graded from the front of the building to the outside of the borders, with a fall of about

double duty by using it in winter to shelter our half-hardy roses from November to May. Those that do not make rose-growing a business, as I do, can nevertheless profit by my example, and use the cold grapeery for many purposes during the winter months when it is not used for the grape-vines. Besides Roses, all plants of a half-hardy character may be there kept, such as Pomegranates, Grape Myrtles, Pampas Grass, Tritomas, Carnations, etc., care being taken that the pots or tubs in which they are planted are plunged in leaves, tan, or some such substance, so the roots do not get frozen.

ONE HUNDRED DOLLARS FOR A TOMATO.—Peter Henderson & Co. offered last spring to purchasers of seed of their Trophy tomato one hundred dollars for the heaviest and best specimen of fruit exhibited. Over thirty fine specimens were sent in, the best of which was from Jacob Gass, Perrysville, Pa., who says that it was grown without any extra effort, and was selected from a load of forty bushels that he was that day (September 8th) taking to market. It is very doubtful if Mr. Gass received as much money for his whole load as Peter Henderson & Co. paid him for this single tomato, which weighed 23½ ounces, and was perfect in form. An immense specimen was grown at Newark, N. J., weighing three pounds, and measuring 28½ inches in circumference; but it was received in a badly damaged state, and could not be put in competition. This is the largest we have yet heard of, and shows to what an immense size this variety can be grown under particularly favorable conditions.

Notes from the Pines.

My little greenhouse is only 24 feet long by about half that width. If those whose glass measures hundreds of feet in length find as much work in proportion as I do in mine I wonder how they get through with it. But then I have no gardener. I don't think I should care much for plants that some one else took care of. The whole fun of the thing is in seeing one's work grow under his hands. Last spring I raised some

SEEDLING PELARGONIUMS, or Geraniums, as some prefer to call them. The seeds were sown too late for the plants to bloom in the open ground so they were taken up and put in the greenhouse where they are coming on finely. I had a lot of seeds from one of the best known amateurs in France, but these gave me only two plants, while a packet of Bull's (Eng.) seed from Peter Henderson & Co., sown at the same time, germinated freely and have given fine results. There is nothing in floriculture more interesting than raising

FLORISTS' PLANTS FROM SEED.—It will not be easy to define what florists' plants are, but Pelargoniums, Carnations, Auriculas, Primroses, and a host of others are included in the term. These plants have so "broken," as the gardeners say, that we may expect any possible variation from seed. Take the Pelargonium or Geranium, for instance. It has already given a vast number of varieties, and seed from good sorts is likely to give many more. I have plants from seed that ten years ago would have been thought wonderful, but we have so many sorts now that a plant should be remarkably good to merit addition to our named varieties. If the seed be

sown very early in spring the plants can generally be made to flower before frost comes. While recommending the raising of seedling Pelargoniums as a most fascinating amusement, I must give the amateur

ONE CAUTION.—Which is, don't get excited. Those who grow such plants from seed look upon them with a partial eye and are apt to think because a seedling is not bad it must be very superior. They look at it through gold spectacles and think there is money in their favorite plant. Every florist of experience is yearly annoyed by the many seedling Pelargoniums and other plants that are pressed upon his attention. If the amateur's seedling is valuable he may be sure that the florist will catch at it fast enough, but the chances are 99 to 1 it will be not so good as those he already has.

PACKING PLANTS does not seem to be so well understood abroad as with us. I received a parcel from an amateur in England not long ago in which many of the plants were lost by their being packed too damp. Then the labels were—of all things—written upon parchment, and were in many cases nearly dissolved and rendered illegible by the moist heat. Let me say to those who have occasion to send

PLANTS BY EXPRESS OR MAIL that there is more danger from too much moisture than too little. The best packing material is sphagnum or bog moss, and this should be just so damp only as to be elastic to the touch. Plants packed in this, if not too damp, will remain for weeks uninjured; that is if the plants are at rest.

ANOTHER THING IN PACKING is to pack close. If sending by mail, take a piece of strong brown paper; lay the just damp, not wet, moss upon it, put the plants upon the moss and more moss over the plants. Then begin at one end of the paper and roll up *hard*, secure with a string, and then put another paper over for directions. So in packing in boxes, use the moss just damp, and have the box full and crammed down hard, so that there can be no possibility of moving or shaking in transit.

THE ARTICHOKE, or Globe Artichoke as it is sometimes called to distinguish it from the better known Jerusalem Artichoke, is very little cultivated in this country. In this the eatable portion is the base of the scales which surround the large thistle-like flower-head and the bottom of the head. There is but a small portion to each, and though it is to my taste very delicious—something like boiled chestnuts—it will never be very popular among those who like to dine in a hurry, as the separation of the scales to get at their edible portion is very time consuming. Nevertheless as I try to grow every eatable vegetable that the climate will allow, I made a bed of artichokes from plants sent me by a friend in Georgia who had a very large strain. These many times as I have watched the bed during the growth I have said why not use

THE ARTICHOKE AS AN ORNAMENTAL PLANT.—Its stateliness and the silvery color of its beautifully cut leaves adapt it to the purposes of ornament, and I was quite sure that any one of the plants in my bed would have made a sensation had it stood alone in my lawn. I thought I had made a discovery, but—alas! for human hopes—while in a carriage with several horticulturists making our way along the dreary road that leads to the horticultural Mecca of George Such, one of the gentlemen, well-known for his excellent taste in horticulture, broke the silence with, "Did you ever

consider what a fine ornamental plant the Artichoke would make?" In general I like conundrums, but here was my pet discovery gone in a moment. Nevertheless, the Artichoke is as fine as ever. I like to get

ODD THINGS, but when a gentleman in Texas sends five different kinds of bulbs without note or comment it is very puzzling. If he had given the roughest description of the flowers I might have made them out, or if he had said what soil, dry or swampy, they grew in I should have known how to treat them. As it is I have to divide them, and try a part of each as greenhouse bulbs, a part in a cold frame, and others in the open ground.

Among the comparatively new things that I tried last year for the first time are some

ORNAMENTAL PEACHES, several varieties of which were sent last spring by Mr. P. J. Berckmans, of the Fruitland Nurseries, Augusta, Ga., who has a fancy for getting together the unusual forms of the peach. Some are worthy of a place in a collection of ornamental trees.

THE PYRAMIDAL would hardly be taken for a peach-tree if one was not near enough to see the character of the leaves. Its branches all turn upwards, and the general aspect is that of a Lombardy Poplar.

THE PURPLE-LEAVED was rather a disappointment after having my ideas formed upon the colored engraving in the Gardeners' Monthly. Its leaves, to be sure, are purplish red in the spring, but it loses its color as they mature, and the tree is then as green as any other. The young leaves of the second growth are also colored. Of course, the story of this having sprung up from the spot where some general was killed is all "bosh."

THE AUSTRALIAN DWARFS are very promising. These are said to have originated from the *Peen-To*, the flat peach of China. Those two that I have are beautiful bushes; the joints are so close together that the foliage is singularly crowded. Mine have not bloomed yet, but are said to have double crimson flowers and good fruit. It is doubtful if they will succeed in the open air at the north. I put mine in boxes and placed them in the cellar for the winter. They are certainly deserving of the attention of those who grow peaches under glass.

Mr. B. sent me leaves of a curious cut-leaved variety, which he discovered in a bed of seedlings, and which we may hope to know more of.

The Hoya or Wax-Plant.

The kind of house-plants that we best like are those which stay by year after year. Most of our readers no doubt know some house in which the plants—such as an oleander, a laurestinus, an orange or lemon-tree—are as much a part of the household effects as the furniture itself. They have been in the family year after year, placed out-doors or on the "stoop" in summer, and in autumn removed to the living room, where tender care protects them during unusually cold nights. Plants like these have, so to speak, a history; they have grown up with the family, and have in a measure become one of it. We sometimes, though not often, see the Wax-plant treated in this way, and now and then come across a plant that has been in the family for years and years. The Wax-plant is a native of the East Indies, and in its native

country grows upon decayed trees, which it clothes with its fine green foliage. In cultivation it is rated as a stove or hot-house plant, and it is one of the few plants of that class that accommodate themselves to the ungenial at-

improved *arrosoir*. Nothing can be more handy than the common watering-pot; it has two handles, one for carrying and the other for pouring, both made of flat tin, with edges that are very uncomfortable to the hand; then

this handle is so placed that the pot is well balanced in the hand, whether it be full or contain only a quart of water; moreover, the rose is nearly as large as a common saucer, and throws a great number of minute streams.

THE WAX-PLANT.—(*Hoya carnosa*.)

mosphere of the dwelling-room. The engraving gives the leaves and flowers of the Wax-plant rather less than the natural size. The leaves are very thick and fleshy, and remain for a long time. The plant is a rather slow grower in house-culture, and blooms less freely in such conditions than in the hot-house. Its flowers are in clusters, and have such an artificial appearance that the name "Wax-plant" was naturally enough applied to it. They are white or rather flesh-colored, with a pink center. The flower-stalk continues to put out flower clusters, and should not be cut away. It being a climber, the Wax-plant is usually trained to a frame or trellis of some kind; it should have plenty of pot-room, and be well drained. Like all fleshy plants, it requires but little water when it is not in a growing state. There is a variegated form in which the leaves are marked with white, and indeed some of them entirely white. This is a still slower grower than the normal form, and is not to be commended for house-culture. The name of *Hoya* was given to the genus, of which there are some twenty species, in honor of Thomas Hoy, who was gardener to the Duke of Devon half a century ago; the specific name, *carnosa*, refers to the fleshy character of the leaves.

it has a little bit of a rose, which throws a spray over a very small surface, and the operation of watering with one of these clumsy

NEW FRENCH WATERING-POT.

A New French Watering-Pot.

In the matter of watering-pots the French man beats both John and John-athan. We doubt if a Yankee or a Britisher ever improved upon the first watering-pot, while scarcely a year passes but the French have some new and

things is a trial to the hands and the patience. A French rose watering-pot has but one handle and that is round and easy to the hand;

When Mr. B. K. Bliss was last in Europe he brought home some samples of a new style of watering-pot in which no rose is used. He placed one of these in our hands for trial, and we were so much pleased with it that we advised him to have a stock of them made for sale. The engraving shows the form of the pot. It will be seen that it has a very long spout and the round and properly placed handle to which we have already alluded. With a handle of this kind the hand can be placed at just the right point for the implement to balance, and there is none of the strain upon the wrist that is demanded by the ordinary form. A column of water of the length of the spout when allowed to flow comes out with no little force. As the stream of water issues from the nozzle it is intercepted by a flange, which is cast in brass of a peculiar shape, with the effect to break the stream into the thinnest possible sheet of water, of a most beautifully curved form. At the upper part of the engraving the form of the discharge of water is shown, as well as that of the flange which produces the effect. It will be seen that the water is dispersed over a broad space, and its force is so far counteracted and it is spread so exceedingly thin that it can be allowed to fall upon small and delicate plants without injury. We are not an advocate of the general watering of gardens unless there is a provision for doing it other than by hand; but hot-beds, plants in pots that are set out for the summer, and newly planted things that must be nursed, all require watering, and we have described an implement which we think will do it more rapidly and satisfactorily than any other that we have seen.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

About a Laundry.

Washing day is the melancholy day in the household. Everybody is cross and tired, for washing is a disagreeable and laborious work. That it is necessary is no mitigation. No wonder we have frequent communications asking about washing

Fig. 1.—WASHING MACHINE.

machines and laundries, and the feasibility of banishing this labor from the household to an establishment where it may be done by machinery for the families of a whole town or village. We have recently visited a laundry in which all the work except the ironing is done by machinery; and because we believe there are many places in country villages and towns where it would be a great convenience to have such a laundry to do the work of a large number of families, we have prepared the accompanying illustrations for the purpose of clearly describing the machines and the methods used.

Figure 1 shows the washing machine. The clothes are put into it through the holes in the side. The holes are then closed up, the hot water and soap are poured in through a pipe, the machinery is started, and in a short time the clothes are sufficiently washed. After rinsing, they are put

Fig. 2.—DRYING MACHINE.

into the rotary drier, figure 2, in which they are freed from water. They are then carried to the drying-room, which is a large apartment heated by ranges of steam-pipes, and there, hung upon lines stretched across the room, they are quickly dried. Those that need starching are put through the machine, figure 3, the superfluous starch is squeezed out, and they are taken to the ironing-room. Shirts which need the bosoms starched and glossed are passed through a machine prepared expressly for this purpose (figure 4) before being

ironed. The irons are heated upon a stove, fig. 5, from which they are taken to the ironing-room adjoining to be used. The machinery here described is suitable for a large laundry; in some smaller establishments lighter machinery is used. The ordinary Doty or similar washing machines of large size are used, which are put in operation by a steam-engine. The wringing or drying, starching, and ironing are performed very much in the same manner in all these laundries. A laundry sufficient to do the work for a hundred families may be furnished for \$1,000, exclusive of the building and a steam-engine of ten-horse power.

Home Topics.

BY FAITH ROCHESTER.

WHAT SHALL BE DONE WITH THE WASHING?—

Many of us could get along quite comfortably without a hired girl if there were no washing and ironing to be done in the house. These two big jobs give us at least two days of hard work—work which alone is quite enough for a strong woman to perform in two days, without the added labor of cooking and dish-washing, and sweeping and bed-making, and *child-nurture*—all of which must be carried along through the washing and ironing days as upon other days. It is often the case that the members of the family could so divide the work between them, as to do it all except the washing, and do it better than any hired servant would. Shall we hire a washerwoman? But we have to pay her a good deal—a large proportion of what a girl's wages would cost. She does nothing but the washing and floor-cleaning, probably, for one day's work, and we have her to wait upon. I have to pay a washerwoman at least a dollar a day, and I can get a hired girl to do all of my family work for two dollars a week. This is, perhaps, lower than the average of wages where I live, but the girls call this an easy place, as they get considerable time here for sitting down or going out. In the summer time I prefer to keep the girl, and then I find more upon my own hands in the way of general "putting to rights," and sewing and care of children, than I can well accomplish and leave margin for getting out of doors and for reading and writing. As cold weather comes, and the city prices of fuel begin to astonish and alarm people in moderate or low circumstances, the case takes a different shape. I see how I can rig up the kitchen warm and snug, and spend the forenoon there, with the children helping (?) me about the chores, doing their little tasks of sewing and knitting and reading, and then getting their frolic out of doors while I prepare our simple dinner—the master of the

house taking his dinner down town. While we eat dinner the other part of the house is getting warm, and the eldest child (aged seven) washes the few dinner dishes, with the little sister's help in wiping them, while I get the sitting-room and its bedroom tidy. Then we take up our afternoon quarters, allowing the kitchen fire to go out, and I notice that this daily change has a good effect upon the spirits—and so, of course, upon the health. What place is there in this arrangement for a hired girl? [I don't like this way of talking. I have to

lay down my pen to listen to the interruption of conscience—something or other about the "golden

Fig. 3.—STARCHING MACHINE.

rule," and about "family selfishness"—all of which I cannot report. I can only acknowledge my personal inability to obey the golden rule in all relations, till sometime in the long "ever and

Fig. 4.—BOSOM STARCHER.

ever" when it shall be the standard rule of all mankind.]

I have employed a washerwoman for a few weeks, but it is a very unsatisfactory arrangement. I have to stay in the kitchen myself to do the general housework; so, of course, the children are there too. I do detest the slops and steam, to say

Fig. 5.—STOVE FOR HEATING IRONS.

nothing of the odor that comes from the woman at the tub—one of the tribe of the "great unwashed." The children behave worse than com-

mon, and I get less chance to "oil the machinery," or "wet the clay," or whatever you call the opportune words and "switching off" tricks for keeping squabbles at bay. They get cold feet and hands from the frequent opening of doors, and perhaps from the windows open at the top to let out the steam. If the kitchen must serve as a laundry it should be a pretty bare room, as the steam of the suds is so generally injurious.

I must "put out" the washing, then—to have the flannels all shrunken, the calicos faded, the white clothes begrimed? And then, I do not know of any woman about here (taking in washing) who would keep her room in as wholesome a condition as I should mine. How wet some of these kitchens do get with steam. This added to the compound smell which prevails in such rooms the whole winter long, makes a home for little children about as unwholesome as possible. But the woman wants money to buy shoes and stockings for her children. I can not give her that and pay for the washing beside. She wants to do the washing—mine and other folks—and I pass it along with a heart of pity for her children, and for their mother. She is saved considerable mental suffering by her unenlightened condition. If her baby dies she will only weep over a "mysterious providence."

When can we have good, cheap, public laundries?

A WORD FROM THE WOMAN'S CONGRESS.—While I was agitating the question with which I started these "Topics" this month, an essay upon the subject of "Enlightened Motherhood," read before the Woman's Congress lately in session in New York, came in my way. Much of the "light" attempted to be shed abroad upon this subject is simple darkness, it seems to me. "Ideas are in the air," Emerson says, and I take it as a sign that some of the clouds of crude ideas in our mental skies are blowing over, that an essay on Enlightened Motherhood in the first Woman's Congress should have recognized so well some of the limitations of a mother's power and responsibility.

Mrs. Corbin, who wrote the paper on Enlightened Motherhood to which I refer, had been studying a pamphlet sent out to the mothers of Philadelphia by a medical society of that city, "On the Care of Young Children during Hot Weather." Mothers were told, in that, to have their cooking done "in a shed, or in the yard, or in the garret," but there was a plain suggestion that a kitchen in the bottom of the house must impair the purity of the atmosphere of the rooms above. Mothers were also told to keep their children out of the rooms where cooking and washing were being done.

If this latter caution is important in hot weather when all the windows and doors may stand open, it seems equally so in winter when the steam and odors are so much more confined.

Almost every day children come into our house who smell so badly of the odors of the kitchens where they live that I can hardly bear to go near them. I have not tried to count the smells, but I distinctly perceive tobacco smoke, burnt grease, and over-burnt, over-boiled, bitter coffee.

Mrs. Corbin tells how she inquired of her wise physician what she could possibly do to save the life of her babe who was slowly dying. He answered: "The best that you can do, the best that any mother can do with a nursing baby as delicately organized as this one, is, as much as possible, at all times and under all circumstances to keep a quiet mind. Be placid, equable, unmoved. Your baby draws her life from your life now. It must be sweet, serene, unshaken by storms, or she can not thrive upon it."

Mrs. Corbin says: "But what advice is this to give to a housekeeper, beset with the nameless and numberless sources of discord and inharmony which characterize the reign of the "black beast" and Bridget. With a kitchen stove, and an ordinary cook, or rather the ordinary succession of cooks, each one worse than the last, the cases are rare and exceptional when a woman can ever be sure of a year and a half of such quietude of

mind as is absolutely necessary to the proper bearing and rearing of a child. It is, therefore, after mature deliberation, and with a solemn sense of my own responsibility to God and man, that I stand here and charge upon the kitchen stove a very large percentage of the mortality that desolates our homes. Banish cooking and laundry work from the house, with all their concomitants of foul odors, unnecessary heat, and an atmosphere periodically surcharged with vapor, and the salubrity of the premises would be increased fifty per cent. With cookery and laundry work, Bridget also would fold her tent like the Arabs, and as silently steal away."

Several years ago Mrs. Stowe, in the pages of the Atlantic Monthly, prophesied and prayed for the establishment of public laundries and public cooking houses. It will probably be some time yet before we get them, even in our cities, and we must possess our souls in patience and do the best we can. Let us learn all that we can about the laws of health, about ventilation and wholesome cookery; and let us be more careful to prevent the escape of steam into our kitchens, where our children have to live as long as their mother is confined there. What if we should abolish dough-nuts and griddle cakes and other fried food? Couldn't "papa" stand that? Ah! He must be "enlightened" too!

"THE BLACK BEAST."—It is blacker than there is necessity for, it seems to me. Mr. R. had a leisure day at home lately, and after doing a number of "dickering jobs," he said to me:

"If you will tell me where to find the blacking, I'll black the cook-stove. It is just cool enough now."

I thanked him, but said I didn't want it blacked. I knew it was quite brown, but I was content to have it so. He looked surprised and I explained.

It has been several years since a blacked kitchen stove has seemed clean to me. I hardly dared to entertain such a thought, till I found that some of the very neatest housekeepers thought so too, and practiced accordingly. They wash their stoves daily, and the surface of the stove is then clean. A blacked stove blackens everything that rubs against it, and the children's stockings often suffer from its contamination. I have never been able to polish a stove without a deal of trouble to prevent soiling the carpet or walls adjacent; and I always feel as though my own body and clothing have been unnecessarily defiled, even when I wear gloves. To keep a stove black requires daily attention, and it is one of the unnecessary cares with which I do not choose to encumber myself.

My auditor looked his approval, and remarked: "They say that greasy dish-water is best for washing a stove."

"I can not bear to use it," I said, "the smell of it upon the hot stove is so disagreeable. I prefer to keep a cloth for that especial purpose, and to use clean water. The greasy water gives a blacker surface to the iron, but that does not pay me for the bad odor it gives out."

"I think you are right," said Mr. Rochester. "Besides polished stoves give out less heat than those with rougher brown surfaces."

It is not necessary to put the hands into the water with which the stove is washed. Make a small mop or swab with a wooden handle, and rinse this out and hang it to dry each time when you have done with it.

CARE OF THE HANDS.—Is there any particular virtue in rough, red hands? It is disgraceful to shirk necessary labor, but soft, white hands are a comfortable thing for a wife and mother, or any other woman to possess. Try a few drops of ammonia in the basin of water with which you wash your hands after the day's housework is done. It has a softening and cleansing effect. Powdered borax is also excellent. Glycerine is the thing to use upon chapped hands and the cracks at the finger ends.

A WORD FARTHER ABOUT STOVE HEARTHES.—It occurs to me that I overlooked one strong point in favor of the high hearths. It is not often, I

think, that your low hearth offers equal facilities with a high one for broiling. Certainly no way of cooking a steak is quite equal to genuine broiling. I have tried the way of cooking it in a hot ungreased spider a good deal, but broiling is better, though usually more troublesome.

GRIDIRONS OR BROILERS, AND STEAKS.—The gridirons that go with our stoves usually have grooved iron bars. It is a trouble to keep these clean. Wire broilers are more easily managed. One that shuts the steak in so that it can be turned, gridiron and all, is very convenient.

A steak should be turned several times, at very short intervals. It should lie as near as possible to the hot coals. The under side sears almost instantly. Turn it before the juice has a chance to gather upon the upper surface, and sear that side also. Frequent turning keeps the juices in the steak, but if you perceive them upon the meat when you go to turn it, hold it over the hot meat platter while you turn it. The double wire gridiron makes this an easy matter. This, also, is the easiest gridiron that I know of for snatching from the coals when a blaze flashes up. Salt thrown upon the blaze puts it out. Flames under the steak are apt to give it a bad, burnt flavor. To avoid them cut away and leave out the big chunks of suet that sometimes come with the steak.

Do not season the steak till nearly or quite done. Put it at once between hot platters with its seasoning, and after a few moments you will find it all covered with juice or gravy.

I have used a patent broiler upon the top of the stove over a hot blaze, but I prefer the coals. When broiling at the top of the stove over a wood fire look out for your draughts. If there is a "top draught" in the front of the stove, this is the time to open it. Have the dampers turned so as to draw the smoke up chimney as fast as possible, never using the oven at the same time.

What Shall we have for Breakfast?

The above question was proposed in the November number, and the answers have been coming in at a most unexpected rate. Indeed, so numerous are the lists that the committee to whom they were referred have been unable to make the decision in time for it to be published in the Household pages, but it will be given among the "Basket Items," as that portion of the paper goes to press some days later than this.

Puddings and Pancakes.

BY MRS. H. S. P.

PLUM PUDDING.—Two eggs; six crackers; three pints of sweet milk; a piece of butter the size of an egg; one cup of raisins; a little salt and nutmeg.

BAKED INDIAN PUDDING.—Four eggs; one quart of sweet milk; five large tea-spoonfuls of Indian-meal; nutmeg and sugar to the taste. Boil the milk and scald the Indian-meal in it, then let it cool before adding the eggs. Bake three-quarters of an hour. Eat with butter or sweet sauce.

PANCAKES.—One egg; two spoonfuls of sugar; one cup of sweet milk; one tea-spoonful of soda; two tea-spoonfuls of cream-of-tartar; three cups of flour.

QUICK PUDDING.—One egg; one cup of sugar; one table-spoonful of melted butter; one cup of sweet milk; half a tea-spoonful of soda; three cups of flour. Bake half an hour or more. Eat with sweet sauce.

SAGO PUDDING.—Two large spoons of sago boiled in one quart of milk; the peel of a lemon; little nutmeg; when cool add four eggs; little salt. Bake about one hour and a half. Eat with sugar and cream.

DOUGHNUTS.—One egg; one cup of sugar; two cups of sour milk; one spoonful of cream if the milk is not very rich; one tea-spoonful of soda; little salt; nutmeg; flour enough to roll.

BOYS & GIRLS' COLUMNS.

About Horse-Shoes.

Who made the first horse-shoe? We do not know, and doubt if any one does. We can get a pretty good idea of what the first one was like from the kind now in use in the far East, where everything that belongs to farming is at the present day very much as it was in the time of "Moses and the prophets." The corn is trodden out by oxen just as it was in Scripture times, and if Adam ever did any plowing he probably used the crooked stick that at the present day turns the soil of the Holy Land. A gentleman attached to the Oriental Topographical Expedition—which is engaged in surveying the Holy Land—recently brought us an Eastern horse-shoe. It is so unlike the shoes used upon our horses that we thought the boys and girls would like to see an engraving, which we give in figure 1. The shoe seems to have been beaten out of a piece of iron, and beaten so thin as to make a

Fig. 1.—ORIENTAL. Fig. 2.—MEXICAN HORSE-SHOE.

hole in the middle, which is left of an irregular shape. The shoe at the edges is not thicker than ordinary pasteboard. Of course, a horse with so much flat iron on his feet would not be very sure-footed, so the nails by which the shoe is fastened to the hoof are made with very large heads. The Spaniards are not much in advance of the Orientals in their farm implements, and in those parts of America settled by the Spaniards we find that no improvement has taken place for centuries. We give alongside of the Egyptian shoe one that we brought from Mexico several years ago (figure 2). This is rather ahead of the Egyptian affair, but looks very odd in comparison with those we use. The Mexicans do not, as a general thing, shoe their horses and mules, but in a rocky country they are obliged to, and this is the kind of shoe they use. The nails by means of which the shoe is attached have heads which project from the surface of the shoe about half an inch.

The Doctor's Talks.

ABOUT A PIECE OF LIMESTONE.

Last month I asked you to put some of your lime with a plenty of water in a bottle, cork it up, and let it stand. The liquid will look perfectly clear and quite like pure water, and the lime will apparently have all settled at the bottom. We found that limestone before it was burned did not dissolve in water; now does it behave any differently after being burned? There looks to be as much lime at the bottom of the bottle as there was at first; but it will not do to trust to appearance. So to find out whether the water is just the same as when it was put with the lime we must ask it questions. The eye tells us nothing; how is it with the taste? Pour a little of the liquid out of the bottle and taste. It does not taste very pleasantly, but it will not hurt you to just taste it. This is evidently not pure water, and we infer that it has taken up (dissolved) some of the lime. To question this liquid still further you can get a few bits of the outer leaf of a red cabbage; put them in a cup and pour boiling water over them, and when cold pour this cabbage tea into a glass. It will be of a bluish or violet color. Add a little of the water which came from your lime—lime-water we will call it—and see what happens. Your cabbage liquid turns at once of a beautiful green. You might further prove that the water had dissolved some lime by pouring some of it into a clean saucer and placing this on the cooler part of a stove, where it will gradually dry up or evaporate. When the water is all gone, and the saucer quite dry, you will find a film or scum of something upon the inside of the saucer. This film is so very thin that you will conclude that the water has dissolved but very little lime, and you will be right. Although the water has dissolved all the lime that it possibly can, the quantity is only about nine grains in a pint of water. Or to put it in another way, one part of lime

requires over 700 parts of water to dissolve it. Two ordinary barrels of water are not able to dissolve one pound of lime. When water or any other liquid has dissolved all of a solid that it can the solution is said to be saturated. We can have a saturated solution of lime by using, as we see, a very little. A pint of water is saturated with about nine grains of lime, but it would take five or six ounces of common salt to so saturate a pint of water that it could dissolve no more; and if we dissolve sugar a pint of water will need about twice its weight of sugar before it is saturated. Although water at the ordinary temperature dissolves so little lime, boiling water dissolves still less. When you hear "lime-water" spoken of you will know that it means this clear solution of lime in water. When lime is stirred up with water it makes a milky mixture, such as is used in white-washing, which is often called "cream of lime" or "milk of lime. This is, however, only a mixture, and not a solution, for if it is allowed to stand all the lime, except the little that water can dissolve, will settle to the bottom of the vessel that holds it. Now, there are two more experiments that I wish you to try with your lime-water. Dissolve a small bit of soap in water, a piece as big as a bean in half a teacupful of water. When the soap is dissolved add some lime-water. You will see that a curdy matter will form which will not dissolve in water. Our hard soaps are made of soda and fat; they are soda soaps, and these dissolve in water. When you add lime-water to a soap of this kind the lime, so to speak, takes the fat away from the soda and forms a lime soap which is not soluble. You see now why some waters are called "hard." They contain lime in some form, which they dissolve while in the earth, and when we undertake to wash our hands in them with ordinary soap there happens just what did when you poured lime-water into a solution of soap—a lime-soap forms, which sticking to the hands makes them feel very unpleasantly. The second

experiment is to put into a tumbler or wine-glass some of your lime-water, and then with a straw, pipet, or other such tube breathe into the lime-water—that is to take a full breath, and then let the air from your lungs pass through the straw or other tube in bubbles through the lime-water. Before your breath has passed for many seconds into the lime-water you will see that it is clouded; it will soon become so milky that you can not see through it. If you set it aside a white powder will fall to the bottom of the glass. You will wonder what this means. What can there be in your breath that should so disturb and cloud the clear lime-water? Before we answer this let us go back a bit. In November I told you that one way to test lime-stone was to powder it and pour vinegar over it, when small bubbles would rise. Again, last month you were told that when limestone was strongly heated to make lime of it it lost almost half its weight. What did it lose in the shape of bubbles when vinegar was put to it, and what did it lose when heated? The loss in both cases was the same—carbonic acid. I can not stop to tell you more about carbonic acid now than that it is an invisible gas, in which a flame can not burn, and in which an animal can not live. So poisonous is it, that when air is mixed with only a moderate share of this gas illness or even death may be produced. When coal or wood is burned this gas is formed and mixes with the air. When limestone is heated or "burned," as it is called, to make lime, large quantities of this gas are given off, and it forms in other ways; so a very little, about 1/2000 of its bulk, is always present in the air. Though in large quantities it is injurious to animals it is needed by plants. They can not grow without it. They are constantly taking it up from the air. Animals are, on the other hand, constantly sending it out of their lungs; it is the way in which much of our food is used up, this forming of carbonic acid. When you breathed into the lime-water the carbonic acid of your breath united with the lime to form carbonate of lime, which is just what the limestone from which it was made was. But we must now leave the limestone—but not I trust without many of you having found something to think of.

THE DOCTOR.

Something about Gunpowder.

Boys have a great fancy for gunpowder, and their interest in the subject is especially lively early in the month of July. The father of one boy says he likes to gratify his boys upon the Fourth of July, but he finds gunpowder rather expensive, and he wishes to know if we can not tell him the proportions of niter (saltpeter), charcoal, and sulphur, so that he can make his own powder. As the answer to this question will interest boys in general, we put it here. The proportions of the ingredients of gunpowder are about 16 parts each of charcoal and sulphur to 100 parts of niter. If these are powdered

very fine and mixed, they would have all that gunpowder contains, but the firing of it, would produce no bang at all but only a rather slow-burning fizz. You see it requires something besides the sulphur, charcoal, and niter—the value of the powder depends upon the making—so we must advise this gentleman and boys in general to give up the idea of making their own powder, as, aside from the danger of the matter, they can not succeed without going to great expense. But perhaps you will like to know how it is done at the powder factories? Well, the ingredients are reduced to the finest possible powder by being put into revolving drums with several hundred pounds of balls or bullets, which, as the drum turns, fall and roll and grind the stuff as fine as dust. Then enough water is added to make a paste. This paste is put between cloths and put under a powerful press, and comes out in cakes. These cakes, when dried, are broken up by stamping-mills, and the grains of different sizes separated by means of sieves. All the dust powder is sifted out, and the different sizes of powder separated according to fineness. Then the best kinds are put into a drum which revolves, and the grains rub against one another and give that handsome polish seen in the best rifle powder. Ordinary cannon powder is coarse compared with that used for rifles and shot-guns; and that made for the enormous cannon now in our forts and monitors—"baby-walkers," the sailors call them—is so coarse that you might take it for lumps of coal, though you might find out the difference if you undertook to kindle a fire with it. The powder is made coarse for these large guns, so as to burn comparatively slowly. If it went off as "quick as a flash," the gun would probably "go off" too, instead of the ball.

A Game for a Winter's Evening.

Perhaps it is not exactly a game, but it might be easily made into one. I don't know what to call it either, unless it be a "Journey by the Fireside," or it may be the "Home Encyclopedia." The idea is this: Some one selects an object, any common one whatever, and questions the others. Take, for illustration, the first thing before me—my lamp. See what a lot of questions may come out of this. What is the lamp made of? What is brass? What is zinc? Where does it come from? In what shape is it found? What color? Does it melt easily or not? What is it used for besides to make brass? So the same series or longer of questions about the copper. The base of the lamp has lead run into it to make it heavy, and a whole lot more can be learned about that. Then the chimney and shade are glass, and probably but very few can tell much about so common a thing as that. The wick—that is, of course, cotton. What is cotton? what part of the plant? where is it grown, and all about it? why is the wick made hollow, in the form of a cylinder? Then the oil—there is quite a story about that. Here is a single article in the room that would keep a lot of bright boys and girls profitably at work a whole evening. Such a looking-up of dictionaries and other books before some of the questions could be properly answered! and no doubt some of the older people would find themselves at their "wit's ends" to answer all the questions that could be put. I hope some of the boys and girls will try this, for they will find out in the first place how little they really know about the articles they handle and use every day, and in the second place they will find that these silent common things, like some silent common people, have a history if they can be only made to tell it. At least so thinks your OLD UNCLE.

NELLIE H. L.—Certainly, dear, you "may send" your "alphabetical arithmetic." It is not a great deal more trouble for me to revise than to construct.

EMMA L. D. thinks that "the few hundred rivers published in the November *Agriculturist* will be a great assistance" to her "when hunting in future for 'concealed rivers.'"

Thanks for letters, puzzles, etc., to O. A. Gage, Charley S., M. L. A., F. D. M., S. R. G., and Frank Powers.

A Dubious Prospect.

The artist calls his picture a dubious prospect, and it apparently is one for poor Jack. The barn is evidently none too good, and all through the night Jack has heard the storm, and when daylight came he had little difficulty in pushing open the carelessly-closed window and taking a look about him. He now sees what has happened during the night, and looks upon the drifts that the wind, which made him so uncomfortable, has heaped up against the barn. He perhaps wonders if the boy whose business it is to furnish his breakfast will make his way through snow-drifts as high as the barn window. If said boy is like some boys we have known, old Jack's chances for an early breakfast are indeed "dubious." Then again, if the boy is like some others that we have known, and are glad to know, his first thought as he looked from his window at the wintry prospect was for the old horse, who is quite dependent upon him for comfort; and if he is the right kind of a boy he will think that the horse on such a morning as this needs his feed earlier than on a warm one, and if he should give old Jack something a little extra this snowy morning we should think all the better of him for it. We don't think much of a boy who does not get attached to a good, faithful family servant such as old Jack no doubt is. One can make a very good guess at the character of a boy or girl, and judge what kind of a man or woman they will make, by the way they care for the animals dependent upon them. We hope that the boy will not only give the anxious-looking horse his hay and oats, but an extra feed of sixpenny nails. "Feed a horse on six-penny nails! I never heard of such a thing."—Well, probably you never did. But you know that food keeps the horse warm, and when it is very cold he has to eat more to keep comfortable than in warm weather. Well, if the boy uses the nails to fasten up loose boards, and thus keep out the cold winds and make his stable warmer, it is very much the same as if he gave him extra food. That is what we mean by hoping for Jack an extra feed of nails.

The Vienna Exhibition.

AUSTRIAN COURT HONOR TO AN AMERICAN CONTRIBUTOR.

TELEGRAMS TO THE NEW YORK HERALD.

VIENNA, Nov. 1, 1873.

TO FARMERS & PLANTERS.

DOUBLE REFINED POUDERETTE for sale in lots to suit customers. This article is sold for half the price of other fertilizers, and is cheaper for Cotton, Corn, Tobacco, and Vegetables than any other in the market. Price, delivered on board in New York City, \$25 per ton. Ask attention to the following testimonials:

CHARLES A. MESSENGER, Providence Co., R. I., writes: "The Double-refined Poudreite I bought of you has given satisfactory returns, and I consider it the best of anything I can use for an early crop." THOMAS W. LATHAM, Providence Co., R. I., writes: "I would rather have your Double-refined Poudreite than any phosphate I ever used. Where I used it on Potatoes it was far ahead of any other manure."

L. H. SHELDON, Sup't of the New Jersey State Reform School, writes: "We have used Poudreite for several years upon our farm crops, and for the money invested we have found nothing that has done us so much service."

S. J. KELLY, Burlington Co., N. J., writes: "I used Double-refined Poudreite on Rutabaga Turnips alongside of Peruvian Guano and Hen Manure. Where the Poudreite was applied the increase was thirty per cent over the others."

WILLIAM H. CADY, Ocean Co., N. J., writes: "I used Poudreite on Corn, Sweet and round Potatoes, Onions, and Lima Beans. It brought forward my crops two weeks earlier. I think if the best manure I ever used, giving better results than Peruvian Guano, at much less cost."

VAN ANTWERP AND VAN BUREN, Montgomery Co., N. Y., writes: "Poudreite has been used in this locality for ten years past, mostly on Corn, and those who have used it say they have from 1/2 to 3/4 more Corn by using the Poudreite."

W. F. GERKIN, of Essex Co., N. Y., writes: "I have used the Double-refined Poudreite for the last five years, and I consider it the cheapest fertilizer I can buy—giving the best results for the cost."

MILTON STRONG, Suffolk Co., N. Y., writes: "I gave Poudreite a thorough trial this year, using it upon Corn, Potatoes, Lima Beans, Tomatoes, and Vines, and I have never raised better crops. My Corn will yield 100 bushels of ears per acre, and my garden was the surprise and admiration of all who saw it."

HENRY T. HORTON, Cheshire Co., N. H., writes: "I find, from experiments made last year, the Double-refined Poudreite is the cheapest fertilizer to use on Tobacco. I put it beside Peruvian Guano with equal cost of both, and the Tobacco was 30 per cent better where I used Poudreite."

W. H. REMINGTON, Hartford Co., Ct., writes: "I have used Poudreite on Corn, Potatoes, and Tobacco. There was but one piece of Corn in the place equal to mine, and that had 30 loads of manure per acre and mine none. The Tobacco started as soon as set and grew luxuriant."

WM. S. POMEROY, of Hartford Co., Ct., writes: "I have used the Double-refined Poudreite for several years on Tobacco, and I think it one of the best fertilizers made for this crop."

A Pamphlet giving full directions, etc., sent free on application to JAMES T. FOSTER, 66 Cortlandt Street, New York.

THE PEOPLE'S Force & Suction PUMPS.

For the house and out of doors, and for wells from 10 to 120 ft. deep. Awarded Medal of American Institute, Nov. 15, 1873, for "best force pumps" of all exhibited.

AMERICAN AGRICULTURIST.

PATENT DEPARTMENT.

IMPORTANT TO INVENTORS. American Agriculturist PATENT DEPARTMENT

In compliance with the request of numerous inventors, we have organized a

PATENT DEPARTMENT

in connection with this office for the transaction of all business connected with

Securing Patents

in the United States and foreign countries.

Reliability

which has been maintained by the AMERICAN AGRICULTURIST for more than thirty years will be carefully guarded in this as in other departments.

All Inventors

desirous of procuring patents at moderate cost are invited to forward (express prepaid) a model of their invention, with a brief description of its working. The model should not exceed one cubic foot in dimension. Upon receipt of model an opinion as to patentability will be given free of charge.

Preliminary Examination

at the Patent Office, to determine patentability, will be promptly made for a fee of \$5.

Litigation of Patents.

The services of the best counsel have been secured to prosecute or protect before the U. S. Courts and the Patent Office the claims of those intrusting their business to this agency.

Specifications, drawings, engravings, models, and all other appliances furnished at moderate prices.

In all dealings with this Department inventors may depend upon promptness, fidelity to their interests, and the best services which can be rendered by thorough experts.

For full particulars, address

AMERICAN AGRICULTURIST PATENT DEPARTMENT, ORANGE JUDD COMPANY, 245 Broadway, New York.

AMERICAN AGRICULTURIST. ORANGE JUDD COMPANY, Publishers, 245 Broadway, N. Y. ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.20 each; Twenty copies and upward, \$1 each. Papers are addressed to each name. Either English or German Edition, at these prices. HEARTH AND HOME: \$3 a year for less than four. Four to nine copies, \$2.75 each; 10 or more copies, \$2.50 each.

Hearth and Home (weekly) with American Agriculturist sent to one address for \$4 a year.

Try JANUARY. There is no Better Month than this, in all the Year, for Making up Clubs and Securing the Valuable Articles offered in our Premium List.

The Publishers of American Agriculturist and HEARTH AND HOME take pleasure in presenting their new general Premium List for 1874. The Premiums which they have offered in past years have engaged the attention of a very large number of persons of all ages and both sexes. Many thousands have secured Premiums, and very many of these, who at first had small hopes of success, have been themselves astonished at the ease with which they have raised large clubs and secured valuable Premiums.

Here is pleasant and profitable work for all.

- Boys and Girls, Young Men and Maidens, Middle-aged Men and Women, Farmers, Mechanics, Merchants, Professional Men, Anybody, Anywhere

who wishes to do good and make money, can do both by going to work as here invited by the publishers of these two most valuable journals, American Agriculturist and HEARTH AND HOME. You need only to show specimens of the papers, promise the beautiful Chromos, which are now ready for delivery, according to the publishers' offer, and forward your subscriptions.

There is no danger of failure in the enterprise if you go into it with spirit. You may succeed in

raising a club much larger than you had at first calculated upon; and even should you secure fewer subscribers than at first hoped for, the Premiums are so many and so various that you could not fail to be suited with some good thing on the list.

Persons of all classes have engaged successfully in the work, and very many have materially increased their income, and that too without encroaching upon their ordinary working hours and with but little trouble to themselves. The articles offered as Premiums are worth the regular price which is set against them. They are new and good. They have almost universally pleased and satisfied the recipient. You can obtain one or more of them.

TRY IT. The American Agriculturist is everywhere known and approved. HEARTH AND HOME issued every week, with the Best Original Stories, contributions on Live Topics, a capital Household Department, and a most interesting Department for Children and Youth, should be in every home in America. The papers are entirely different. Taken together, they supply more good reading than can be found in fifty books costing one Dollar each.

Premium Clubs can be made up of subscribers to either paper, or partly of one and partly of the other, as noted over the Table. We call especial attention to the last column of figures, showing the small number of names required where both papers are taken, at the reduced price of \$4 a year.

You, Reader, can get a Premium. TRY IT.

Explanatory Notes. N. B.

Read and carefully

Note the following items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But... (b) Tell us with each name or list of names sent, that it is for a premium... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have any time, from now until July 1st, to fill up your list... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers... (f) Specimen Numbers, etc., will be supplied free as needed by canvassers, but they should be used carefully and economically, and where they will tell... (g) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd Company, or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Post-master, and take his receipt for it. Money sent in any of the above ways is at our risk; otherwise it is not.

[In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 a year for American Agriculturist, and \$3.00 a year for Hearth and Home; also at the club rates of \$1 and \$2.50; also at the rates of \$4 a year for both papers together.] Descriptions of Premiums on next page.

N. B.—In all Premium Clubs for either paper, TWO copies of American Agriculturist (English or German) at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the 2d and 4th columns, or from the 3d and 5th, or wholly from the 6th column.

Table of Premiums and Terms. Columns include: No., Names of Premium Articles, Price of Premiums, American Agriculturist (Number of Subscribers required), Hearth and Home (Number of Subscribers required), and Both Papers Together (Number of Subscribers required). Rows list various items like Moore's Floral Set, Gold Pen, Paragon Pen, etc.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 2 to 8, 27 to 33, 55 to 78, and 81 to 93, inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express office nearest the recipient) to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance desired. See Description of Premiums on Next Page.

Full Descriptions

of our Premiums are given in a previous number, and will be mailed free to applicants. We have room in this paper only for the following Descriptive Notes:

No. 1.—Moore's Floral Set.—This is a beautiful Premium—a complete set of Ladies' or Children's Garden Tools for the cultivation of flowers, consisting of a Floral Hoe, Spade, Fork, and Rake. They are made of the best steel and iron, with finely polished hard-wood handles, light, durable, and highly finished, and each set inclosed in a box. They will be found very convenient in the garden and greenhouse, and are pleasing toys for the little folks. Made by the Moore Manufacturing Company, Kensington, Ct.

Nos. 2, 3, 4.—Gold Pens; with ever-pointed Pencils, in extension, coin-silver cases.—Premium No. 2 contains the best No. 4 Gold Pen; and No. 3 the best No. 6 Gold Pen, which is the same style, but larger. No. 4 contains No. 7 Gold Pen, in Gold-tipped Ebony Holder. Each pen will be sent in a neat leather case by mail, post-paid. These pens are made by Geo. F. Hawkes, No. 66 Nassau St., and have obtained an excellent reputation. We have known the maker and his goods for many years, and can recommend them.

No. 5.—Ladies' Fine Gold Pen, in Rubber Case, Gold Mounted, with Screw Extension, and Gold Ever-pointed Pencil. A beautiful present for a lady teacher or friend. Same maker as No. 2.

Nos. 6, 7.—Paragon Patent Revolving Pencil.—This is a beautiful Pocket Pencil, which is extended or closed by pulling or pressing the head. They are made with great care, and every Pencil warranted to work perfectly. They are gold-plated, and will last for years. We offer two patterns, one for ladies, with ring for chain, at \$1.50 each, and one of heavier and firmer plate, at \$3.00. Same maker as No. 2.

No. 8.—Payson's Indelible Ink, and Briggs's Marking-Pen Combination.—Payson's Indelible Ink is too well known to need further commendation. It is almost indispensable in the family. Briggs's Marking-Pen has been before the public for fifteen years, and is justly celebrated for all kinds of marking, and particularly for writing upon coarse fabrics. The Pen and Ink are put up in a neat case, being thus portable, always ready for use, and protected from loss or injury by evaporation or breakage.

No. 9.—Cake Basket.—A new pattern, oval-shaped, nicely chased—a very taking, useful, and beautiful table ornament. This, with other articles that follow, is made by the Lucius Hart Manufacturing Co., of Nos. 4 and 6 Burling Slip, New York City, and is warranted by them to be of the best triple plate. Mr. Hart, "the veteran Sunday-school man," was engaged in the same place and business for nearly a quarter of a century. We have known him and his work for many years, and have taken pleasure in commending and guaranteeing its value to be as represented. We believe the Company which bears his name is fully sustaining his reputation. The amount of silver upon plated ware depends wholly upon the will and integrity of the manufacturer. We could give nearly as good-looking plated ware for less than half the money.

No. 12.—One Dozen Teaspoons.—

No. 13.—One Dozen Table-Spoons.—These are "figured tips." Olive-leaf Pattern, all of the same metal, plating, etc., and from the same makers as No. 9. They are far cheaper than anything we have found at half the price, and are well worth working for.

No. 14.—One Dozen Table-Forks.

—The same description and remarks apply to these as to No. 13. We select as premiums only such articles as we can warrant in quality and price. All these articles come from the Lucius Hart Manufacturing Co.

No. 15.—Child's Cup.—A beautiful gift for the little one-year-old. It is made by the Lucius Hart Manufacturing Co. Triple-plated on the outside and gilded on the inside. It never breaks, and will last for many years—indeed, be a life-keepsake.

No. 17.—Child's Carriage, or Perambulator.—An elegant carriage, handsomely finished, upholstered with reds, has full plate tuned joints, handle tips, side lights, dash rail, panel body, and carpet on the bottom. These carriages are from the well-known manufacturer C. W. F. Dare, 47 Cortlandt St., New York.

No. 19.—Doll's Cottage Chamber Set.—A most attractive gift for a little girl. Eight pieces of furniture prettily painted: Bedstead (size 11½ X 18 inches), bureau, table, commode, towel-rack, two chairs, one rocking-chair. From C. W. F. Dare, 47 Cortlandt St., New York.

No. 20.—Crandall's Improved Building Blocks furnish a most attractive amusement for children. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. For developing the ingenuity and taste of children they are unequalled. The Blocks are put up in neat boxes, accompanied by a large illustrated sheet giving various designs of buildings, etc. This is one of the most successful toys ever invented.

No. 21.—Crandall's Masquerade Blocks.—These are put up in boxes, the blocks in each of which will make, by various combinations, 300 different pictures in brilliant colors. They are not injured by washing, and afford endless amusement for children. They are beautiful gifts for the little ones.

No. 22.—Knives and Forks.—These have ebony and metal handles, manufactured by a patent process which unites them so firmly to the blades that they never work loose, and are rendered hot water-proof. The knife blades are silver-plated. Made in the best style by the Woods Cutlery Co., 55 Chambers St., New York. For this Premium we will give either the Table, Medium, or Dessert size, as may be specified by the recipient; six knives and six forks, or twelve knives without forks.

Nos. 23, 24, 25.—American Table Cutlery.—We are glad to be able to offer really good articles of American manufacture, such as are competing successfully with the best foreign make. Messrs. Patterson Bros., 27 Park Row, who supply us with these articles, are also importers of English goods. They recommend these Knives, manufactured by the Meriden Cutlery Co., as equal to any Cutlery in the market, and their recommendation is a guarantee wherever they are known. We offer two kinds of Knives, and three sizes of each kind. No. 23 have Rubber Handles, which are actually boiling-water proof, so that, if they were accidentally to remain in it for several minutes, or even hours, they would not be injured. The Blades are of the best steel, and warranted. Dessert size, with Forks, sold at \$15.00. For 24 subscribers at \$1.50, or 80 at \$1, we will give either the medium size or the table size, sold at \$16.00. No. 24 have Ivory Handles, are selected with great care, have Steel Blades, and are beautiful goods. Dessert size, with Forks, sold at \$20.00. For 33 subscribers, at \$1.50, or 110 at \$1, we will send the medium size, sold at \$22.00. For 35 at \$1.50, or 116 at \$1, we will send the Table size, sold at \$23.00. The Forks, which accompany these Premiums, Nos. 23 and 24, are made of genuine Albata, and warranted double-plated with coin-silver. These Forks are furnished to us by Messrs. Patterson Bros.... The Carving-Knife and Fork are made by The Meriden Cutlery Co., with the best Ivory, balanced Handles.

Nos. 27, 28, 29, 30.—Pocket Knives.

—HERE'S FOR THE BOYS AND GIRLS!—These Premiums are among the most pleasing and useful that we have ever offered. Every boy, and girl too, wants a pocket knife. We give them an opportunity to obtain a most valuable one for merely a little effort. These knives are furnished by the Meriden Cutlery Co., 49 Chambers St., New York, whose work is equal to any done in this country or Europe. No. 27 is a neat, substantial Knife, with three blades and buck-horn handle. No. 28 is a still finer article, with four blades and pearl handle. No. 29 is an elegant Knife, with five blades and shell handle. No. 30 is a Lady's Pocket Knife, a beautiful article, with four blades and shell handle.

No. 31.—Mutton in Parvo Pocket Knife.—Boys, Read this. It is a most attractive as well as useful Premium, from the Meriden Cutlery Co., 49 Chambers St., New York.

It comprises, in one knife-handle, a large and a small blade, a screw-driver, a saw, a strong hook, a nutcracker, a brad-awl, a gimlet, a corkscrew, a pointer, a slim punch, tweezers, and, in addition to this, it can be used for various other purposes which will at once suggest themselves to any smart boy or man. It is a pocketful of tools weighing but two ounces. The knives will be sent anywhere in our country, post-paid.

No. 33.—Extra Early Vermont Potato.—This remarkable potato is a seedling raised in 1867 from a seed-ball of the well-known Jackson White. It is supposed to have been fertilized from the Garnet Chili, as it resembles many seedlings of that variety. For five years the "Vermont" potatoes have been grown side by side with the Early Rose, both under the same treatment, and have proved seven to ten days earlier than that favorite sort; they are more productive, fully equal to the Early Rose if not superior in quality, flesh very white, dry, and starchy, excellent keepers, and in every way a most promising variety. We have made arrangements with Messrs. E. K. Bliss & Sons, 23 Park Place, New York, to supply us with the genuine article, to go by mail, post-paid, to any part

of the country. They should go out before freezing weather, but when too late for this we will keep them until warm enough to mail them in the spring. This Premium can only remain open while the supply lasts.

No. 40.—Doty's Improved Clothes Washer, with the Metropolitan Balance Weight. Over seventy-five thousand families in the United States are using the Doty Washing Machine, and we believe the improved machine has no superior. The "help" use it and like it. Send for descriptive circulars to R. C. Browning, 32 Cortlandt St., New York, or to Metropolitan Washing Machine Co., Middlefield, Ct. It goes cheaply by freight or Ex.

No. 45.—A Good Watch.—The Watches made by the American Watch Co., Waltham, Mass., have peculiarities of excellence which place them above all foreign rivalry. The substitution of machinery for hand labor has been followed not only by greater simplicity, but by a precision in detail, and accuracy and uniformity in their time-keeping qualities, which by the old method of manufacture are unattainable. A smoothness and certainty of movement are secured which proceed from the perfect adaptation of every piece to its place. The extent of the Waltham establishment, the combination of skilled labor with machinery perfect and ample, enable them to offer watches at lower rates than any other manufacturers. Their annual manufacture is said to be double that of all other makers in this country combined, and much larger than the entire manufacture of England. The mechanical improvements and valuable inventions of the last fifteen years, whether home or foreign in their origin, have been brought to their aid, and the presence of nearly 800,000 Waltham Watches in the pockets of the people is the best proof of the public approval. We offer a Silver watch, jeweled, with chronometer balance, warranted by this Company as made of the best materials in the best manner, and in pure coin-silver "hunting" case; weight 3 oz. This watch we offer as one of our Premiums, with the fullest confidence. Upon the movement of each of these watches will be engraved, "AMERICAN AGRICULTURIST. MADE BY THE AMERICAN WATCH CO., WALTHAM, MASS."

No. 46.—Ladies' Fine Gold Watch.

—This elegant Premium will delight our friends who may receive it. Our arrangement with the American Watch Co. (see No. 45 above) includes these beautiful gold watches. They are full-jeweled, in 18-carat "hunting" cases, warranted to be made of the best materials, and possessing every requisite for a reliable Time-keeper. Upon the movement of each Premium Watch will be engraved "AM. AGRICULTURIST. MADE BY THE AM. WATCH CO., WALTHAM, MASS."

No. 48.—Double-Barrel Gun; or

FOWLING PIECE.—These guns are the genuine London "Twist" barrel, Patent Breech, Bar Lock, ebony ramrod, and in all respects desirable. Their caliber and length of barrel vary, and may be ordered to suit the kind of shooting to be done. They are furnished for this Premium by Messrs. Cooper, Harris & Hodgkins, 177 Broadway, well-known as one of the most reliable and best houses in their line of business, and they highly recommend this particular gun, and guarantee it in every respect. It is from one of the oldest and most favorably known English manufacturers. The price is not put on in fancy carving and plating for show, but in the gun itself. This Premium includes Gun, Powder-Flask, Shot-Pouch, and Wad-Cutter.

No. 49.—Remington's Sporting

Breech-Loading Rifle.—The Rifle offered as this Premium has a 30-inch steel barrel, and can be of any weight from 8 to 13 lbs., and of any caliber from $\frac{27}{100}$ to $\frac{60}{100}$, as may be desired. Ammunition is extra, and at prices varying in accordance with the caliber. These rifles are manufactured by the noted firm of E. Remington & Sons, Nos. 281 and 283 Broadway, New York, whose reputation is world-wide, and who stand in the front rank of manufacturers of fire-arms.

Nos. 81 to 92.—Good Libraries.—

In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any one of the premiums 81 to 92 may select any books desired from the list of our books published monthly in the American Agriculturist, to the amount of the premiums, and the books will be forwarded, Post or Express paid. Let the farmers of a neighborhood unite their efforts, and through these premiums get an agricultural library for general use. See Table List of Books in advertising columns.

No. 93.—General Book Premium.

—Any one sending 25 or more names, may select books from our list to the amount of 10 cents for each subscriber sent at \$1; or 30 cents for each name sent at \$1.20; or 60 cents for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through, by us. See List as in No. 81.

Grape-vines run Wild.—A subscriber in Plymouth, Iowa, asks what he shall do with vines three or four years old that "have always grown as they pleased."—This is a difficult conundrum to answer. Could we see the vines we could decide at once, but it is difficult to prescribe without seeing the patient. When the leaves are off the buds will be plainly seen. Let our Iowa friend remember that each of these buds will produce a shoot next spring, upon which the fruit will be borne. If he cuts all the canes made this year back to two buds each, he will probably leave twice as many as are needed. No invariable rules can be given for pruning a vine. One should understand the way in which a vine grows, and adapt his knowledge to the case in hand.

Mushroom.—"J. C. G." The plant in question can not be, from your rough outline, the edible mushroom. It is more probably the Morel. We can not decide without seeing a specimen. The attempts at cultivating the Morel have not been very successful.

Smoking Pork.—Hams and pork are almost always over-smoked. When saturated with smoke the meat is rendered indigestible and unpalatable, and we notice that there is a general complaint now making in regard especially to the excessive smoking of Cincinnati pork. The common practice of allowing meat to hang in the smoke-house during the whole winter, and to smoke it for a few hours almost every day for several weeks, is destructive to its proper flavor and wholesomeness. For bacon, two days' smoking with corn-cobs or hickory brush is sufficient; for hams, four days' is quite enough, and sufficient flavor will have penetrated in that time to the center of the meat to make it palatable to the most smoke-loving taste.

Value of Brewers' Grains.—"Hawthorne." Brewers' grains fed to cows help the production of milk, but we would not advise any feed when the production of butter is in view but the very sweetest and most perfect meal. Sour feed will inevitably make itself known in the flavor of the butter.

Weevil in Barns.—"J. S. R.," East Moriches, L. I. When a barn is infested with weevil it is a difficult matter to get rid of them. If the granary only is infested they may be killed by washing the floors and walls with strong, boiling hot soft-soap suds. The granary should then be washed over with lime-wash in which carbolic acid is dissolved. The weevil may be kept out by having wire-gauze over the windows and by making the walls of the building very tight and close. On the approach of cold weather the weevils leave the wheat and hide in the crevices of the granary; then is a good time to destroy them. No grain should be stored until the granary has been thoroughly swept and cleaned. All the dirt and weevil swept out should be burned.

Injection Syringe.—"J. W. T.," North Haven, Ct. An injection may be given to a horse by means of an ox or pig's bladder, in the neck of which a wooden pipe is inserted. The pipe may be made of a piece of elder from which the pith has been forced out. It should be reduced in thickness, made very smooth by sand-paper, and should be well greased or oiled when used. The injection of a pint of linseed oil or a quart of salt and water is needed to remove the worms which infest the rectum or lower intestine.

The Chufa or Earth Almond.—"E. L. S.," Phelps Co., Mo. The chufa or earth almond (*Cyperus esculentus*) is a plant of the same genus as the Nut-grass which is found such a pest in Southern fields. It was introduced from Spain about 20 years ago; and the fact that during that time it has never made any sufficiently favorable impression upon those who have experimented with it to induce them to continue its growth is not a recommendation to it. Its only use has been as food for swine, and for this purpose it has been favorably spoken of by some of the Southern agriculturists.

Spreading Lime in Winter.—"J. C. W.," Manasses, Va. Lime may be spread upon the snow or frozen ground during winter as well as late in the fall. It should, however, be finely slacked and evenly spread. This plan will answer upon wheat or rye or upon meadows which may require liming. As a general thing it has been found desirable to apply lime in this way upon clover fields which are to be broken up the next season for corn or wheat.

Pleuro-Pneumonia.—"F. R. W.," Waterbury, Conn. The first symptoms of pleuro-pneumonia in a cow or ox are such as are only to be noticed by a person who has observed the habits of healthy animals. They are a slight increase of the temperature of the body, difficult breathing, with drumming or whir-

ring noise in the bronchial tubes. A cough frequently occurs, the appetite fails, and the animal becomes thin. Then the milk falls off, and shivering fits commence the second stage, after which the animal rapidly becomes worse. The best treatment has been found to be careful nursing, warmth, and hanging sacks saturated with carbolic acid in solution before the animals' heads, so that the vapor can be breathed; warm gruel and mash, and one to two drams of elixir of vitriol in a gallon of water.

Potato Rot.—"C. C.," Westbrook, N. J. It is generally accepted that potato rot is due to a species of fungus, though some doubt whether the fungus is the cause or the result of the rot. The more interesting question to the farmer is how he shall avoid the disease. It has been found that drainage of moist land, avoiding the use of raw barn-yard manure, or, in fact, any fermenting substance, and the growing of potatoes upon dry gravelly loams, or light dry soils, with the help of superphosphate of lime and wood ashes as manures, tend to the growth of healthy potatoes. Excessive moisture, and the presence of decomposing vegetable matter, cause abundant growths of various species of molds and other fungi, and are, therefore, greatly provocative of rot in the potato. The best plan is to avoid the causes, and mitigate, if not prevent the trouble.

Manufacture of Fertilizers.—"B. S.," Allen Co., Ind. Guano is not a manufactured article, but a natural product, the origin of which is a disputed point. Superphosphate of lime is simply bones or mineral phosphate of lime, treated with sulphuric acid in such a way as to separate a portion of the lime from the phosphoric acid, leaving the phosphoric acid in excess, hence the term *super-phosphate*. The extra phosphoric acid is thus soluble in water, and can be readily appropriated by plants. Artificial fertilizers are now so largely manufactured, and there is so much competition in the business, that they may be purchased much cheaper and better than they can be made by the farmer.

Plaster upon Wheat.—"P. W.," Buncombe Co., N. C. It is better to apply plaster upon any crop in the spring than in the fall. The best time is as soon as growth has fairly commenced. About 100 to 200 pounds per acre is a heavy dressing.

Cats.—"H. C. B.," Ellsworth, Me., writes us that he stops the depredations of cats upon his poultry houses by setting a fox-trap in the entrance hole and covering it with chaff, by which plan he has trapped 16 in a short time. To this we would remark that this is an unnecessary barbarity. There is not the slightest need to have cats or any other nightly depredators in the poultry houses. The entrances should be closed every night and opened every morning. This would not only keep the fowls safely during the night, but prevent much disease and loss from their early wanderings amongst wet grass and weeds. Cats should be well fed, as being necessary farm animals, and not be allowed to exist in a half-starved condition, which is often a satisfactory excuse for many of their so-called thefts.

The Florida Settler.—We have received a pamphlet, entitled "The Florida Settler and Immigrant's Guide," a manual of information concerning the soil, climate, and productions of that State, prepared by the commissioner of lands and immigration, whose office is at Tallahassee, Fla. Now that attention is turned towards the mild climate, orange groves and gardens of Florida, this pamphlet is opportune. It will be sent by the commissioner on receipt of request with stamps to cover postage.

Poisonous Pastures.—Not long since we noticed a statement of the death of forty-four out of a herd of over seventy cattle upon an English pasture, in consequence of their feeding upon poisonous plants, chiefly or wholly an umbelliferous plant, known as the Drop-wort (*Oenanthe crocata*). Similar losses of stock have occurred recently in Australian pastures, from certain species having been eaten during periods of scarcity of wholesome fodder. During the past few years many cattle have died in various localities in the West, from various disorders, to which many fanciful names have been given. Murrain, fevers of all sorts, red water, black water, and in loss for another name these deaths have been attributed to "new" and "unknown diseases." The symptoms of the cases of poisoning above referred to, and those of the deaths which have been reported to us or have been described by other journals, are strikingly similar. Staggering gait and profuse frothing at the mouth, convulsive twitchings of the flank, blood-shot eyes, bloody urine, congested membranes, and often offensive diarrhoea, a lateral curvature of the neck, and in many cases violent frenzy equally mark the whole, and point unmistakably to poison of some kind.

It is an important question if a large portion of the deaths amongst our native cattle in the West are not due to the presence of poisonous plants in the pastures. Generally late in the summer, when the grasses have become dry and withered, the Western pastures are covered with a mixed herbage, of which a large portion is innutritious and indigestible, and may be poisonous; of this the cattle are impelled by hunger to partake. In the cases of poisoning referred to, the supposition was originally that some sudden disease had stricken the animals, but on examination of the contents of the stomachs the fatal plants were found, and the true cause of death ascertained. A knowledge of the nature of poisonous plants would be very valuable to stock owners, as would also such habits of observation as would lead to the easy detection of the causes of deaths. Doubtless murrains of various kinds, Texan fever, and other obscure disorders, owe their existence to causes which a careful observer might discover.

Cost of a Crop of Corn.—"J. B. S.," New York. The cost of raising an acre of corn, where all the labor is hired and a man and team costs six dollars per day, will be more than the value of the crop. For instance, the following estimate will show what result may be expected: One day plowing, a quarter day harrowing, a quarter day marking out, and one day in all cultivating, equal to two and a half days' team work, \$15. The planting, enting, and hnsking will occupy five days of a man's labor, equal to \$10; total, without counting seed and fertilizer, \$25. The crop may yield 25 bushels shelled corn under these peculiar circumstances; but if 40 are realized an even account will result, leaving the fodder to cover some expenses not enumerated.

Renting Dairy Farms.—"W. R. R.," Buchanan, Mich.—We are not prepared to say from actual knowledge what proportion of the final produce the renter of a cheese dairy farm should receive for his labor. In renting a grain farm on the half share of all the produce, the tenant has more labor to perform than he would have on a dairy farm, and the owner would have a larger investment on a dairy than on a grain farm. The value of the produce of each ought to be about the same. A just division should include a proportionate recompense to the owner for his increased investment; but if the tenant should supply all the extra feed which ought to be purchased on such a dairy farm, this would certainly restore the balance, and an equal division of the total proceeds would, we judge, be just for each party.

Tan-Bark for Strawberries.—"J. L. D.," Bloomsburg, Pa. A mulch of tan-bark will not sour the strawberries. The great objection to it is that the fine particles will adhere to and soil the fruit. Leaves or coarse hay or litter from the stable are better.

Information Wanted.—"G. H. E.," Napa Co., Cal., has two acres of land so situated that a creek runs through it and overflows it during winter, and in summer the ground is very dry. He asks what crop he should raise upon these two acres.—We are at a loss to advise in such an extreme case, and request some of our California readers to give us their opinion upon it. We would suggest, however, that here is an opportunity to overcome a difficulty by mechanical methods; damming out the water in winter and irrigating in the spring and summer, and then growing market crops suitable to a moist soil, as cabbages, celery, cauliflower.

Heaves.—"Teamster," Sharon, Pa. The cause of heaves or broken wind is not yet satisfactorily accounted for. It is said by some veterinarians to be incurable; still we never found a case in our experience that was not either greatly relieved or entirely cured by simple treatment. This was as follows: To aid the digestive power by simple tonics, and to feed the most nutritious and least stimulating food in small bulk, avoiding all dry, dusty food. For instance, a horse purchased by the writer for a very small sum, as being incurably diseased with the heaves, was fed three times a day with a painful of cut timothy hay and oats in the sheaf, soaked in hot water and fed when cold, mixed with three quarts of oats, corn, and rye bran ground together. A handful of salt was given in each feed, and occasionally a few raw potatoes or carrots cut and sprinkled with bran were given in addition. Nothing else was done, no medicine was given, no long hay was fed, and all dust in the feed was carefully guarded against. The result was an immediate change for the better, and no trouble from the disorder at all after a few weeks. The horse was then able to drive rapidly, and might be considered cured. On the other hand, horses have been known to become diseased immediately after feeding upon dusty clover hay, the inhalation of the dry seed-chaff or other dust doubtless causing the trouble.

ON THE BLUE, BETWEEN CAMDEN AND CRETE, - CRETE AT THE LEFT, IN THE DISTANCE. REPRESENTATIVE VIEW OF LANDS FOR SALE BY THE BURLINGTON AND MISSOURI RIVER RAILROAD COMPANY.

IOWA AND NEBRASKA LANDS.

What Time in the Year is it Best to Buy Them?

THE BURLINGTON AND MISSOURI RIVER RAILROAD

Advertise that "Produce will pay for Land and Improvements several times over within their credit of ten years, with nothing to pay for four years but six per cent annual interest." Proceeds of crops are sometimes necessary and always convenient for paying this interest and annual installments, of principal after the fourth year as they accrue; hence it is wise to buy at such a time that all payments will fall due after harvest, on the heels of which the pork and beef crop follows. Delays of payment, asked for and granted, are generally "till after harvest."

These facts show that September, October, November, and December are the months most convenient for annual payments to mature; hence buying land "after harvest" is the best arrangement for ten prospective annual payments. Autumn is also the best season to "make a good ready" for next season's crop, such as selecting land, building a house, digging or boring a well, buying a wagon, team, plows, stock, etc., at best rates. Many wish to buy land, but can not come in person to do so before coming with their families. Such can write and specify the kind, location, quality; whether level or rolling prairie or valley and timber land, with running water; distance to Railroad station, market, etc.

The first payment of six per cent on the value of the land wanted can be remitted by Bank draft on Boston, New York, or Chicago, payable to order of GEO. S. HARRIS, Land Commissioner.

Prices range generally from three to ten dollars, averaging about six, though some lands are sold at one and two dollars per acre. On receipt of written application and funds, the best selection will be made that can be at price specified, and if on examination within one year the land thus bought is not satisfactory to the buyer, he can exchange it for any other unsold tract at same price; or for better land by paying the difference.

Nebraska Lands bought in 1873 will be entitled to a credit of twenty per cent premium, if one-half of it is improved and cultivated within two years from date of purchase.

A Deduction of 8, 15, or 10 per cent is made from long credit price in Iowa and Nebraska for full payment in one, two, or three years from date of purchase. Our gratuities, low prices, long credits, small annual payments, great products, and good markets enable every enterprising man to get a good farm and home in a rich, healthy, and beautiful country. Circulars giving full particulars, and in any quantity wanted, are supplied gratis.

A SECTIONAL MAP, on a large scale, showing the exact location of the Lands in Iowa, is sold at 30 cents, and a similar map of Nebraska Lands is sold at same price.

LAND BUYERS, in order to realize all the benefits we offer, should buy Land Exploring Tickets, via Burlington route, of W. D. Cowles, Agent, 317 Broadway, New York; W. H. Wisner, Agent, 59 Clark Street, Chicago, Ill.; or at C. B. & Q. R. Offices in Peoria, Mendota, Galesburg, Quincy, Ill. Or apply to

GEO. S. HARRIS, Land Commissioner, for Iowa Lands, at Burlington, Iowa; or for Nebraska Lands at Lincoln, Nebraska.

Civil Engineering School

OF UNION COLLEGE, SCHENECTADY, N. Y. Thorough course of instruction and field practice. Unrivalled collection of apparatus. Tuition, \$30 per term. Assistance rendered deserving students. Suggestions to Purchasers of Cabinet or Parlor Organs.

The following considerations may save some from the disappointment of purchasing inferior organs at high prices:

1. **Good Organs are very difficult to make.** An organ is not a coarse machine which can be successfully made by any ordinary workman. It is an exceedingly delicate piece of mechanism; a work of art. Its excellence depends on very nice conditions and extraordinary skill in workmanship; and its durability can be secured only by best possible material and construction.

2. **Difficulty of Selection.** It is impossible for an inexperienced person to judge what is a good organ and what a poor one from slight comparisons. Even a poor quality of tone may please at first, from its novelty, though it will soon become disagreeable. As to the durability of an organ no one can judge certainly from mere examination. Yet a poor organ will not last half as long as a good one, and so is dear at half the price, on this account alone.

3. **Many poor Organs are made.** There is great temptation to manufacturers to make poor, almost worthless, organs, because such can be made at half the cost of the best ones, and so will afford good profits even if sold at what appear to be low prices. Since the great popularity of these instruments the market is flooded with poor organs, which can indeed be sold at low prices but are very dear at that.

4. **The recommendations of dealers are likely to be prejudiced.** Dealers are tempted to recommend and sell those organs on which the largest discount is made to them, and these are always the poorest and most cheaply made instruments. Much allowance must be made therefore in listening to the representations of a dealer. Very often his judgment is biased by his pecuniary interests.

5. **An expedient to sell poor organs.** Makers of poor organs generally adopt the expedient of printing enormous prices in their price-lists, so that they can offer large discounts to purchasers, and thus make it appear that they are buying cheap! The printed prices are frequently double the real prices. So far from proving that an organ is cheap because a large discount is offered, there is reason to suspect that a maker who will misrepresent his price in his price-list will misrepresent his organ also in his description of it. There is always reason to suspect an article which is offered at a large discount.

6. **The lowest priced not cheapest.** In articles of this kind, in the manufacture of which there is so much opportunity to slight and cheapen, the lowest priced is almost never the cheapest. The poorest can be sold lowest, and almost always will be, while the best is as often the cheapest.

7. **How to be sure of a good organ.** There is a perfectly safe way to buy an organ, and to be sure of a good instrument. This is to purchase only an instrument by the very best maker, whose reputation is so thoroughly established, whose work has been so often proved best that there is no longer any question in the matter.

Most readers will know that this is the fact in regard to the Mason & Hamlin Organ Co. The first to introduce this class of instruments, their work has always stood indisputably at the head. Not only at HUNDREDS OF INDUSTRIAL COMPETITIONS in America, but at the most important WORLD'S FAIRS ever held—that just closed at VIENNA, and that at PARIS, in 1867—they have been awarded HIGHEST MEDALS for demonstrated superiority. They are the ONLY American Organs ever awarded any distinction at a World's Fair; the ONLY ones which command extensive sale in Europe, and the ONLY ones extensively recommended by both American and European musicians of eminence. How generally musicians regard them as unrivalled may be judged by any one who will look over the testimony of ONE THOUSAND in the TESTIMONY CIRCULAR of the Company.

8. **Also the lowest price.** The system of selling pursued by the Mason & Hamlin Co. secures fairness and the lowest price to every one. They print their lowest prices in their price-lists, which are therefore subject to no discount. These prices are not as low as those for which poor organs can sometimes be bought, but they are as low as organs of such excellence can be afforded by the makers having greatest facilities to make them cheapest. Those who have been offered organs at great discounts from prices of the manufacturers should compare net prices with those of the Mason & Hamlin Organ. Remember that they offer five-octave, double-reed Organs of that extraordinary excellence which characterizes all their work at \$110 each. The exorbitant prices for very inferior organs are from \$170 to \$225, and upwards.

The Mason & Hamlin Organ Co. have just REDUCED the PRICES of many styles, and are introducing new styles more beautiful and excellent than any they have made before, at low prices rendered possible only by reduced cost of material and labor.

Illustrated Catalogues and Price-Lists free. Address

MASON & HAMLIN ORGAN CO.,
Boston, New York, or Chicago.

GEO. P. ROWELL & CO.

conduct an agency for the reception of advertisements for American NEWSPAPERS—the most complete establishment of the kind in the world. Six thousand NEWSPAPERS are kept regularly on file, open to inspection by customers. No reading-room, however complete, receives one-twentieth of this number. Every Advertisement is taken at the home price of the paper, without any additional charge or commission, so that an advertiser, in dealing with the Agency, is saved trouble and correspondence, making one contract instead of a dozen, a hundred, or a thousand. A Book of eighty pages, containing lists of best papers, largest circulations, religious, agricultural, class, political, daily, and country papers, also magazines and all publications which are specially valuable to advertisers, with some information about prices, is sent Free to any address on application. Persons at a distance wishing to make contracts for advertising in any town, city, county, State, or Territory of the United States, or any portion of the Dominion of Canada, may send a concise statement of what they want, together with a copy of the Advertisement they desire inserted, and will receive information by return mail which will enable them to decide whether to increase, reduce, or forego the order. For such information there is no charge whatever. Publishers not only send their files free, but pay Messrs. GEO. P. ROWELL & Co. for their services. Orders are accepted for a single paper as well as for a larger list; for a single dollar as readily as for a larger sum. Address the American Newspaper Advertising Agency,

41 PARK ROW, N.Y.

The American Naturalist,

The only Magazine in the Country devoted to the popularization of

NATURAL HISTORY.

A Popular Entertaining and Instructive

MONTHLY MAGAZINE,

ILLUSTRATED WITH PLATES AND WOOD-CUTS.

A. S. PACKARD, Jr., and F. W. PUTNAM,

Editors and Proprietors.

R. H. WARD, Troy, N. Y.,

Associate Editor of Microscopical Department.

As the articles in the NATURALIST, though of a popular and non-technical character, are written by authorities on the various subjects, each volume forms an ILLUSTRATED ENCYCLOPEDIA OF NATURAL HISTORY of great value as a work of reference to the student and general reader, as well as to those more immediately interested in the STUDY OF NATURE. The NATURALIST is for the STUDENT, the TEACHER, the GENERAL READER, the AGRICULTURIST, the FARMER, the YOUNG, and the LOVER OF NATURE.

Vol. 8 begins with the number for Jan., 1874.

TERMS.—Subscription \$4.00 a year, strictly in advance. Single Numbers 35 cts.

Subscription to Vol. and the 7 preceding vols, in numbers, \$34.00, or bound, \$36.00.

Address AMERICAN NATURALIST,
Salem, Mass.

For further particulars apply to BANKING HOUSE OF AEHLE DUNNICA & CO., Bonville, Mo., Or DONNELL, LAWSON & CO., BANKERS, No. 4 Wall Street, New York.

THE INDEPENDENT.

UNSECTARIAN RELIGIOUS WEEKLY.

Thirty-two Pages, Size of "Harper's Weekly."

As in the past, THE INDEPENDENT will continue in the future to be the largest and by far the best religious weekly published in the world. A large number of the first writers in America and Europe are regular contributors. It has departments devoted to Religion, Literature, Poetry, Science, Missions, Sunday-schools (explanations and comments upon the International Series of Sunday-school Lessons), Education, Ministerial Register, Editorials, Editorial Notes, Young and Old, Commercial Interests, Dry Goods (with latest and most correct Quotations), Market Reviews (comprising latest Quotations of Groceries, Country Produce, General Markets, etc., etc.), Finance, Insurance, and the Farm and Garden; making it by far the best paper for the clergyman, business man, and family.

Among the contributors to THE INDEPENDENT during 1873 may be mentioned: LOUISA M. ALCOTT, JACOB ABBOTT, MARY CLEMMER AMES, H. W. BELLOWES, D.D., HORACE BUSHELL, D.D., LEONARD BACON, D.D., C. P. CRANCH, T. L. CUYLER, D.D., LYDIA MARIA CHILD, JAMES FREEMAN CLARK, D.D., ROSE TERRY COOKE, F. C. EWER, D.D., GEORGE P. FISHER, D.D., WILLIAM LLOYD GARRISON, MRS. GREENOUGH, H. H., GAIL HAMILTON, T. W. HIGGINSON, FATHER HYACINTHE, GILBERT HAVEN, EDWARD E. HALE, J. J. JARVES, CHARLES KINGSLEY, JAMES MCCOSH, L.L.D., W. E. H. LECKY, RAY PALMER, D.D., J. G. PIATT, ELIZABETH STUART PHELPS, HIRAM RICH, A. P. STANLEY, D.D., R. H. STODDARD, HARRIET PRESCOTT SPOFFORD, J. P. THOMPSON, D.D., CELIA THAXTER, W. M. TAYLOR, D.D., J. T. TROWBRIDGE, HENRY WILSON, SUSAN WARNER, JOHN G. WHITTIER.

Its Premium List is extensive and liberal. Our New Edition for 1874 is an elegant Chromo, entitled "Memories of Childhood," from an original Oil painting by the world-renowned artist, F. B. CARPENTER, which was painted expressly for THE INDEPENDENT.

We also offer the beautiful Chromos "Good-night Frolic" and "So Tired"; also Steel Engravings of "The First Reading of the Emancipation Proclamation," "Authors of the United States," "President Grant," "Vice-President Wilson," and "Edwin M. Stanton, late Secretary of War."

TERMS OF SUBSCRIPTION:

Only \$3.00 per year, including the Chromos "Good-night Frolic" and "So Tired," unmounted; or "Memories of Childhood," unmounted; or the Steel Engraving, "Grant and Wilson," or "Edwin M. Stanton," \$3.25 per year—Chromos "Good-night Frolic" and "So Tired," mounted on binders' board; or "Memories of Childhood," mounted on canvas, rolled, ready for framing; or Steel Engraving, "First Reading of the Emancipation Proclamation," or "Authors of the United States." \$3.50 per year—Chromos "Good-night Frolic" and "So Tired," mounted on stretchers, \$9.00 and \$ New Subscribers—the "Providence Wringer."

Agents Wanted.—Exclusive Territory Given.—Large Commissions Offered.

THE NEW STORY.

A Man of Honor.

By GEORGE CARY EGGLESTON.

Finely Illustrated.

The publishers take pleasure in commending this as one of the most charming stories that has been presented to the American people. Mr. Eggleston has given to it, with rare fidelity, the local coloring of the part of the country where its scenes are laid. It is a realistic story of life in the Old Dominion. Its people are ladies and gentlemen. Robert Pagebrook, the "Man of Honor," is every inch a man, and his sayings and doings at once attract and hold the reader's attentive interest. It is a love-story, too, and has the merit, which is not as common as it might be nowadays, of ending to the reader's entire satisfaction.

NOTICES BY THE PRESS.

A capital picture of Life in Old Virginia before the war is to be found in Mr. George Cary Eggleston's "A Man of Honor." Virginian hospitality, Virginian cousinship, Virginian housekeeping, are portrayed in accurate and attractive colors. It is a life which the author has himself known and loved, and he writes of it with a warmth that comes from the heart.—N. Y. Evening Post.

Really readable in the most refreshing sense of the term—a story of the most amusing and attractive interest.—St. Louis Times.

It is written in an off-hand manner, and is bright and amusing.—Worcester, Mass., Spy.

With Virginian life as a specialty, Mr. Eggleston has drawn a simple, straightforward, truthful, and withal, artistic picture of Southern society. It is sketchy, perhaps too much so, but the sketches are all vigorous and show the hand of a practiced artist. In forming the characters of his book it is evident that Mr. Eggleston has drawn oftener on his memory than on his imagination; that he has lived among the people whom he describes, has heard them talk, and seen them under all the moods of ordinary life.—Boston Daily Advertiser.

CONTENTS.

- Chapter 1. Mr. Pagebrook gets up and calls an Ancient Lawgiver.—2. Mr. Pagebrook is Invited to Breakfast.—3. Mr. Pagebrook Eats his Breakfast.—4. Mr. Pagebrook Learns Something about the Customs of the Country.—5. Mr. Pagebrook Makes some Acquaintances.—6. Mr. Pagebrook Makes a Good Impression.—7. Mr. Pagebrook Learns Several Things.—8. Miss Sudie Makes an Apt Quotation.—9. Mr. Pagebrook Meets an Acquaintance.—10. Chiefly Concerning "Foggy."—11. Mr. Pagebrook Rides.—12. Mr. Pagebrook Dines with his Cousin Sarah Ann.—13. Concerning the Rivulets of Blue Blood.—14. Mr. Pagebrook Manages to be in at the Death.—15. Some very Unreasonable Conduct.—16. What Occurred Next Morning.—17. In which Mr. Pagebrook Bids his Friends Good-by.—18. Mr. Pagebrook Goes to Work.—19. A Short Chapter, not very Interesting, perhaps, but of some Importance in the Story, as the Reader will probably Discover after awhile.—20. Cousin Sarah Ann Takes Robert's Part.—21. Miss Barksdale Expresses some Opinions.—22. Mr. Sharp Does his Duty.—23. Mr. Pagebrook Takes a Lesson in the Law.—24. Mr. Pagebrook Cuts Himself Loose from the Past and Plans a Future.—25. In which Miss Sudie Acts very Unreasonably.—26. In which Miss Sudie adopts the Socratic Method.—27. Mr. Pagebrook Accepts an Invitation to Lunch and Another Invitation.—28. Major Pagebrook Asserts Himself.—29. Mr. Barksdale the Younger goes upon a Journey.—30. The Younger Mr. Barksdale Asks to be Put upon his Oath.—31. Mr. William Barksdale Explains.—32. Which is also the Last.

ILLUSTRATIONS.—By M. WOOLF.

"Now I've Got You" (Frontispiece).—Mr. Robert Pagebrook was "Blue."—"I Fall at Once into a Chronic State of Washing up Things."—"Foggy."—Cousin Sarah Ann.—The Rivulets of Blue Blood.—Miss Sudie Declares Herself "so Glad."—"Let Him Serve it at Once, Then."—"Very Well, Then."—"I'm as Proud and as Glad as a Boy with Red Morocco Tops to his Boots."

HEARTH AND HOME FREE. A PRESENT. We have given away as premiums and have sold a large number of the \$12 and \$20 Beckwith Sewing Machines... ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK. FREE FOR ONE YEAR.

Beckwith Sewing Machines ONLY \$12. ONLY \$20.

We have offered as a Premium, and also for sale, for more than a year past, the

Beckwith Sewing Machine, which has been fully described in previous numbers of this paper. We have already given and sold more than one thousand of these machines, and testimonials of satisfaction have come from every quarter.

We still offer the Beckwith Sewing Machine, Improved, price \$12. A new and very simple braiding-foot has been made, by which a child can sew on braid without the least trouble, following any desired pattern with ease; also a new arm, spiral spring and lever for raising the presser-foot, all of which are now set in a position that leaves the needle free to be threaded. The joint is much enlarged, and the machine is otherwise greatly strengthened and improved.

Each of these machines is put in a neat, compact box, with hemmer and guide, oil-can with oil, thread, different-sized needles, etc., with full Printed Directions for using. On receipt of \$12 we will send one of these machines to any address, expressage to be paid by the purchaser.

The Machine as a Premium.

We will give one of these \$12 machines to any one who will collect and forward eight subscribers for Hearth and Home one year at \$3 each; or sixteen subscribers to American Agriculturist for one year, at \$1.50 each, expressage on the machine to be paid by the recipient of it.

THE BECKWITH PORTABLE Family Sewing Machine. PRICE \$20. Enlarged and Improved. ITS WEIGHT IS 7 POUNDS.

While we continue the offer of the Improved \$12 Machine as heretofore, we now offer the new

Portable Family Machine,

price \$20, which comprises all the excellencies of the former, with many valuable improvements. Its size and power are increased, and its capacity thus very much enlarged, without impairing its portability. There have been added cam and eccentric movement, a balance-wheel, and also an oscillating needle-clamp, by which the length of stitch can with the greatest ease be changed to the finest shade of variation without touching the needle.

To any one sending us \$20, we will send one of the Machines (packed in a neat, portable case, with handle to carry it easily), expressage to be paid by purchaser. If, after having the Machine 30 days, and giving it a fair trial, it does not give satisfaction, upon the return of the Machine, express charges paid, we will refund the \$20.

The Machine as a Premium.

We will give one of these \$20 Machines to any one who will collect and forward to us Fifteen Subscribers to Hearth and Home for one year at \$3 each, or Thirty Subscribers to American Agriculturist for one year at \$1.50 each, or One Hundred at \$1 each, expressage on the Machine to be paid by the recipient of it.

Almost any lady can readily secure the small number of subscribers required to get either the \$12 or the \$20 Machine as described above; or some friend can thus obtain it for her as a present.

THE GREAT ILLUSTRATED

Rural, Literary & Family Weekly.

THIS FAMOUS WEEKLY, which has been the Leading and Largest Circulating Journal of its Class for over Twenty Years, not only "still lives" but purposes to render its ensuing (XXIXth) volume better than any yet published. MOORE'S RURAL is the STANDARD AUTHORITY on Agriculture, Horticulture, and Domestic Affairs, and a Choice, High-Toned, and Popular Literary and Family Paper. No other journal in its sphere has such a large and able corps of Editors and Contributors, and none comprises so many Departments, or so great a variety of Subjects, Illustrations, etc. National in Character and Objects, and adapted to both Town and Country, it has ardent admirers in every State, Territory, and Province on the Continent. Ever earnestly advocating the Rights and Interests of the Industrial Classes, MOORE'S RURAL NEW-YORKER has long been the

FARM AND FIRESIDE FAVORITE,

and to-day has no peer in its important sphere of Journalism. Believing in Tact, Talent, and the discussion of such Timely Topics as are of paramount interest to Producing People, it employs the ablest talent in the land, and furnishes the BEST PAPER FOR

THE FARMER,
THE HORTICULTURIST,
THE STOCK GROWER,
THE DAIRYMAN,
THE HOUSEWIFE, etc.

In the future no pains will be spared to render the paper indispensable to the Rural and Industrial Population of the Country, and a welcome guest at every fireside it may visit. The Reading for the Family and Young People, with appropriate illustrations, will receive increased care and attention, while none of the Practical Departments will be neglected—our aim being to EXCEL in every and all features, and to furnish the best combined RURAL, LITERARY, and FAMILY NEWS-PAPER obtainable.

STYLE, TERMS, &c.

MOORE'S RURAL NEW-YORKER contains Sixteen Quarto Pages, weekly, finely and profusely Illustrated, and neatly printed. Only \$2.50 per year—in clubs of ten or more, \$2 per copy. Now is the Time to Subscribe for 1874. Great Premiums or Cash Commissions to Club Agents. Specimens, Premium Lists, etc., sent FREE to all disposed to act as Agents. Address

HENDERSON'S BOOKS

ON

FLOWERS AND GARDENING.

Practical Floriculture.

A Guide to the Successful Propagation and Cultivation of Florists' Plants.

By PETER HENDERSON,

Author of "Gardening for Profit."

Beautifully Illustrated. Price, Post-paid, \$1.50.

In this work, which has everywhere become so deservedly popular, not only is the whole "art and mystery" of propagation explained, but the reader is taught how to plant and grow the plants after they have been propagated. The work is not one for florists and gardeners only, but the amateur's wants are constantly kept in mind, and we have a very complete treatise on the cultivation of flowers under glass, or in the open air, suited to those who grow flowers for pleasure as well as those who make them a matter of trade. The work is characterized by the same radical common-sense that marked the author's "Gardening for Profit," and it holds a high place in the estimation of lovers of floriculture.

"Practical Floriculture" came to hand safely. I am much pleased with it. I ordered "Gardening for Profit" before it was ready for delivery, and during all the years that I have had it I have never once made a failure when I have followed its guidance.

JAMES LYNN,

Farmer and Gardener for Nicolett House,
January 23, 1873. Minneapolis, Minn.

I bought both "Gardening for Profit" and "Practical Floriculture" as soon as they were published, and have found them invaluable in their assistance in gardening operations.

D. H. CHADWICK,

April 15, 1873. Morgantown, W. Va.

I started my greenhouse last fall, and with the help of "Practical Floriculture" I have succeeded beyond my utmost expectations. There is more plain common sense in it than in all the rest put together. I speak the truth and lie not.

J. C. MCCONNELL,

February 4, 1873. Carlinsville, Illinois.

Last October I bought "Practical Floriculture," constructed a greenhouse, and went to work implicitly following its instructions (being entirely ignorant of the business). I have astonished myself and everybody else with my success, all due to this thoroughly plain and practical book.

May 1, 1873. W. B. CALDWELL, Paris, Ill.

Gardening for Profit.

A Guide to the Successful Cultivation of the Market and Family Garden.

By PETER HENDERSON.

Finely Illustrated. Price, Post-paid, \$1.50.

The success of this book has probably not been equaled by that of any horticultural work of the present day. Its popularity is due to the fact that it tells just what people wish to know—the way in which the author made money by gardening—and puts in a plain, striking light all the requisites to success. The writer was not afraid to have people know that he cultivated his land for profit, and more than that, he was quite willing that all should know and practice, if they chose, the very processes which he had found most conducive to the desired end. The late Horace Greeley said of this book: "There are marvels of transformation and rapid reproduction recorded therein which might well shame the dull fancy of the author of Aladdin or of Koolah. There is no theory about it; a man who has made himself rich by market-gardening plainly tells our young men how they can get rich as easily as he did, and without wandering to California or Montana for it either." And tens of thousands who have read and profited by the work could give similar testimony. It is unquestionably the most thorough and the best book of its kind that has yet come from the hand of an American author.

I was an early purchaser of "Gardening for Profit," a reading of which made the possession of "Practical Floriculture" a necessity. I sincerely thank the writer for giving us non-professionals what we have so long needed—some plain common-sense directions for our assistance—and for having exploited some outrageous humbugs which have been perpetuated in all previous works on gardening and floriculture from time immemorial, tending to produce the conviction that nothing but professional skill could raise a vegetable or flower.

LUTHER NEWCOMB,

ORANGE JUDD COMPANY, 245 Broadway, N. Y.

OUR SPECIAL PREMIUMS!

TWENTY FARMS TO BE GIVEN AWAY!

SECURE A GOOD HOME,

AND

SECURE IT NOW.

The Best Chance Ever Offered

FOR

Men and Women, Boys and Girls

TO

Secure Good Homes!

There are throughout the Eastern and Middle States thousands of people anxious to secure for themselves homes in the West. Many of these have not the means to spare to make a tour of examination of the different portions of the West and then purchase the lands they so much need. To meet the wants of some of these the Publishers of the *American Agriculturist* and HEARTH AND HOME have secured a number of farms in one of the most beautiful, fertile, and healthful locations in the great West, and now offer them as Special Premiums to Agents for procuring subscribers to the *American Agriculturist* or HEARTH AND HOME or both.

Location of the Lands.

These lands are within the limits of the well-known and popular National Colony, located in Southern Minnesota and Northern Iowa. In beauty, fertility, and adaptability to general agriculture they are not surpassed by any in the United States. The Colony is organized upon temperance principles, and no intoxicating liquors are allowed to be sold within its limits. The St. Paul and Sioux City Railroad is completed, and regular trains are running through the Colony lands, thus affording access to the best markets. The lands are being rapidly settled by moral, industrious, and enterprising people, thus insuring good society, churches, schools, and all the comforts and conveniences of an old-established community. There are now over fifteen hundred families within the Colony limits. This rapidity of settlement insures a rapid increase in the value of property, so that those who secure these premiums will get property not only valuable to-day, but which can not fail to increase in value very rapidly.

How to Get Them.

We can offer eight farms of forty acres each; eight of eighty acres each, and four of one hundred and sixty acres each for subscribers to our publications upon the following terms, viz:

Forty Acres for 310 subscribers to the *American Agriculturist*, at \$1.50 each; or 155 to HEARTH AND HOME at \$3.00 each, or 170 to both papers at \$1.00 each.

Eighty Acres for 620 subscribers to *American Agriculturist* at \$1.50 each; or 310 to HEARTH AND HOME at \$3.00 each, or 340 to both papers at \$4.00 each.

One Hundred and Sixty Acres for 1240 subscribers to the *American Agriculturist* at \$1.50 each; or 620 to HEARTH AND HOME at \$3.00 each, or 680 to both papers at \$4.00 each.

Value of these Lands.

These lands were appraised more than three years ago by disinterested men at **\$8 per Acre**,

and the rapid rate of settlement in the National Colony will increase their value to from **\$25 to \$50** per acre in a very few years. Better lands can not be found anywhere.

Selection of the Farms.

Persons securing any of these premiums will receive a certificate to that effect, with which they may locate the lands themselves, or have some one else do it for them, or we will have it done without charge by a disinterested person, and forward the deed by mail.

Go to Work at Once.

Now we are confident there are among our readers several thousand men and women, boys and girls, who could easily secure one of these valuable premiums. The winter's leisure (too often wasted) employed in this work could hardly fail to secure one of these farms, and thus prove the foundation of a comfortable fortune. Such an opportunity for securing a home has rarely, if ever, been offered before. As will be observed, we offer but twenty of these farms—eight of 40 acres, eight of 80 acres, and four of 160 acres each, and the rule must necessarily be "first come first served." Therefore, those who intend to compete for these valuable premiums should begin at once.

Remember

that one of our beautiful chromos (as advertised in another place) is given to every subscriber.

Any further information concerning these premiums may be had by addressing

ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.

FRAMES FOR THE CHROMOS.

We have made arrangements to supply frames to our subscribers who may desire them for the Chromos which are now being distributed. Many will no doubt avail themselves of this opportunity to place these beautiful pictures in handsome frames at moderate cost. In all cases where sent by express, the purchaser will pay express charges. The prices of the frames are as follows:

**For American Agriculturist Chromo,
"UP FOR REPAIRS,"**

**Or for Hearth and Home Chromo,
"LOOK OUT!"**

NOTICES BY THE PRESS.

It is full of quaint humor, a tender pathos, and vivid descriptions.—*New York Standard.*

The "events" are stirring and dramatic, and the style is quiet, impersonal, and almost epigrammatic in its ability to lay bare an entire situation or character in a sentence or phrase.—*Brooklyn Daily Eagle.*

It is at once quaint and truthful, and illustrated as it is by masterly cuts, it should be one of the most popular books.—*Christian Standard (Cincinnati).*

For realistic conception and life-like delineation of character, it is not excelled by any American story.—*Methodist.*

Some passages in it, for life-like delineation and the simple, artless beauty which constitute the highest perfection of story-writing, are equal to some of the very best passages in Dickens.—*Religious Telescope.*

PRICE, POST-PAID.....\$1.25.

HO! FOR THE HOLIDAYS!

THE BECKWITH \$20 PORTABLE

FAMILY SEWING MACHINE.

Diploma awarded at the Great American Institute Fair, Nov. 15, 1873.

Hundreds of Letters from all quarters indorse the merits of our machine.

"Our four families, all having \$60 machines, all prefer the Beckwith."

See letter below.

BEAUTY, UTILITY, AND STRENGTH COMBINED.

WHAT A HOLIDAY PRESENT,

From Father or Brother,
For a Wife or a Daughter,
A Sister or Mother!

As we have fully expressed an opinion of its merits heretofore, we prefer to let our patrons speak, who are fully indorsing our highest expressions of this wonderful invention. The following will suffice as a specimen:

Office of "Rural Empire Club," J. W. Briggs, Proprietor, }
WEST MACEDON, N. Y., Oct. 29, 1873. }

BECKWITH SEWING MACHINE COMPANY:

Gents: The Machine has arrived, and has been the rounds and tested in our four families, where there are four \$60 machines; and all agree that The Beckwith is preferable to either, in several points. Please send me two books of instruction for working the machine. We had one, but it is mislaid or lost.

Yours truly,

J. W. BRIGGS, P. M.

Orders promptly filled on receipt of \$5; the balance, of \$15, on delivery by express.

BECKWITH SEWING MACHINE CO.,
862 Broadway, New York.

The End of the World.

A LOVE STORY.

By EDWARD EGGLESTON,

Author of "The Hoosier School-Master."

WITH

Thirty-two Fine Illustrations.

NOTICES BY THE PRESS.

The personages who figure in this story are, with one exception, country people—such men and women as Wordsworth loved to study. It is not every man, whatever may be his talents, that can safely enter this sphere of literary labor. To be successful in it, he must possess exceptional qualities; but for those who know how to find it, here there is gold of the purest, richest kind. In such a work, however, there is no convenient place where mediocrity can rest; there is nothing but absolute failure or absolute success. And Mr. Eggleston has succeeded. His power lies in the delineation of character. The plot is ingenious and natural, the incidents are managed with great skill, and there are many descriptive passages of singular force and beauty. But the strongest impression left on the reader's mind as he closes the volume is that he has been in the company of very interesting men and women, and has made a number of new and valuable acquaintances.—*The Albion, New York.*

Price, Post-paid, \$1.50.

Sample worker by mail to those wishing the agency upon receipt of \$1, which retails quickly for \$2. Address E. M. HALL & CO., Manufacturers, 202 Broadway, New York, or 18 Clark Street, Chicago.

P. S.—"Every Lady should have one."—N. Y. Tribune.

THE SURGEON-GENERAL of the United States at Washington has arranged with the Elastic Truss Co., 683 Broadway, New York, to supply their admirable Truss as needed for pensioners, officers, soldiers, sailors, etc. The wretched metal springs, finger-pads, and iron hoops, and all the brood of torturing implements heretofore imposed upon a suffering and credulous public, are now absolutely abandoned by all but the less informed portion of the community. A few unprincipled dealers, unable longer to sell their horrible instruments of death, the spring Trusses, now steal the name "Elastic Truss," and try to sell their worthless "rupture belts" and bogus "Elastic" and "band" Trusses. The Elastic Truss Co. have 28 Branch Offices in the principal cities: 129 Tremont St., Boston; 1202 Chestnut St., Philadelphia; 255 Pennsylvania Av., Washington; 44 West 4th St., Cincinnati; 415 East Water St., Milwaukee, etc. Send for Circular.

AMERICAN AGRICULTURIST.

NEW YORK, FEBRUARY, 1874.

One more month and spring will be here. It is a good thing to look forward. A farmer lives largely in the future. In the calf he sees the ripe steer. His plans are far-reaching, and require months and years for their perfect development. A man who can not wait with patience will not be a happy farmer. He must work and hope. We have had much to discourage us, but our prospects are now decidedly brighter. For two or three years past we have seen hard times. Wages have been high and prices low. Our expenses have been out of all proportion to our receipts. The "panic" of last September was the effect and not the cause of the general agricultural distress. As we have repeatedly stated, farmers for two or three years past have not been getting adequate compensation for their labor and capital. Many a farmer of skill, experience, and intelligence has received less pay for his labor than the average mechanic, or even, in some cases, than the unskilled laborer on our railroads and public works. The cities and villages seemed to be prospering, while farmers found it difficult to raise money to pay taxes and grocery bills. It needed the panic to convince our bankers, manufacturers, business, commercial, and railroad men that the nation could not prosper when corn was used for fuel, and when the money got for a hog would hardly buy a pair of children's boots. It was well that they should know that a farmer who had to pay \$3 or \$4 per day and board to get men to help him bind a crop of wheat that only yielded eight bushels per acre was not likely to buy many silk dresses or railroad bonds. And so the collapse came.

Now things are changed. Farmers, like all other classes, suffered by the panic, but we shall lose nothing by it in the end.

Favored by low prices, our exports of farm produce have been enormous. It is a good thing to get rid of our surplus. It will give us better prices for what we have left. To-day there is nothing in the prospect ahead that should discourage a good farmer. It seems brighter to us than at any time for several years past. Wages will come down, implements, machines, dry-goods, and groceries will be sold at reasonable rates. What we have to

sell will be higher; what we need to buy will be lower—in fact, is lower already.

But let it not be forgotten that to the poor farmer times are always hard. We must raise good crops and produce good beef, mutton, pork, cheese, butter, and fruit before we have any right to expect good times. It would be a sad thing for the country to have prices so high that a poor farmer who raises only ten bushels of wheat per acre on the average could get rich. The writer is a farmer, and all his interests and sympathies are with the farmer, but we can not but feel that many of our troubles are due to ourselves. We need, it may be, an "elastic currency," cheap freights, and fewer middlemen, more sheep and fewer dogs, a better Department of Agriculture, more farmers' clubs, more agricultural books and papers, and more farmers in Congress—but above all we need a better system of farming. Nothing will help us unless we help ourselves. We must farm better or quit the business. We must raise as much wheat, barley, oats, corn, beans, peas, and potatoes as we do now, but we must raise them on less land. We can not afford to spread our labor over three acres of land to raise 250 bushels of potatoes, when we can raise the same amount on one acre. And so with all the other crops. We shall never make money by farming until we aim to raise large crops per acre. Half our troubles come from spreading our labor over too much land.

Hints about Work.

On our own farm the most important labor of the winter is feeding stock and making manure.

Good Manure can only be made from good food. The more nitrogen the food contains the richer and more valuable will be the manure.

Oil-Cake, either from linseed or cotton-seed, makes the richest manure. Malt-combs, beans, and peas come next, and are nearly as good. Next come bran and clover hay. Then oats, Indian-corn, and barley; then timothy hay and corn-stalks. Bean and pea straw come next; then oat-straw, wheat-straw, and lastly barley straw.

Bran or Shorts is a favorite food with us. We feed it largely to sheep, store pigs, cows, and horses. We can sell timothy hay for \$28 per ton and huy shorts for \$18 per ton. And the manure from a ton of bran we estimate to be worth \$15, while that from a ton of timothy hay or corn is worth less than \$7, and that from a ton of clover hay about \$10, and from a ton of straw \$2.50 to \$3.

Straw and Stalks are scarce and high. We run them all through a cutting box, both for food and for litter. When cut up, straw will absorb much more liquid, and is consequently more valuable for bedding than long straw.

Corn-Meal for Manure has been much talked about lately. We recommend it heartily—but it should first be passed through some animal machine, such as a cow, horse, sheep, or pig.

For Store Animals, half a pound of corn-meal per day for each 100 pounds of live weight, mixed with two pounds of chaffed straw or stalks is, with us, an economical food.

For Fattening Animals, three-fourths to one pound of meal per day to each 100 pounds of live weight is about the proper quantity.

Three Good Plans for Managing Manure are: 1st, to draw it out every day and spread it on the land, or put it in a large pile in the field where it is to be used; 2d, to let it fall into a manure cellar; 3d, to wheel it out every day, or as often as convenient, to some central spot in the barn-yard and make it into a heap. The latter is our own plan.

No Plan can be Worse than leaving the cow manure in a scattered heap just outside the cow stable, and the horse manure in another heap, and the pig manure, half mud and corn-cobs, in another heap, where it freezes solid. Mix the whole in a compact heap, and it will ferment all winter and be ready for use in the spring.

A few Planks are Needed on which to wheel the

manure on to the heap. Without these the work can not be economically performed.

Any Work, that can be done now instead of in the spring should not be neglected.

Seed Corn, if not already selected, should be attended to.

Clean Seed barley, oats, peas, beans, and spring wheat, and put in barrels, bins, or bags ready for use. Blow out all light grains and foul stuff.

Sort over Potatoes in the cellar, and free the cellar from all decaying vegetables and fruit.

Ventilate the Cellar every day by opening the door and windows when the temperature is above freezing or not more than a degree or two below.

Whitewash the cellar walls and also the walls and partitions of pig-pens, cow-stables, hen-house, etc.

Clean and Oil the Harness, and let it be put in thorough repair.

Make an Inventory of everything you have on the farm, and its estimated value.

Petroleum is very cheap. We wish we could induce every reader of the *Agriculturist* to get a barrel and use it freely for preserving implements, machines, etc. In cold weather it is better to warm it before using, as wood will absorb more of it.

Examine every Implement and Machine you have; clean it; oil the bolts and tighten the nuts, and put it in perfect order. Then wash it with petroleum. Go over it two or three times and get on as much as the wood will absorb.

Get out Stone-boat and other planks. Repair old stone-boats and make new ones. Saturate them with petroleum. A farmer would find a stone-boat for every team very useful. For ordinary use two-inch plank is thick enough; but for large stones better have them 2½ or 3 inches thick.

Mend Bags, mark them, number them, and put them in their proper place. A piece of board say three feet long and six inches wide nailed on to one of the beams in the barn makes a convenient support for bags—and for many other things, such as pails, baskets, etc.

A Good Farmer can not enjoy his evenings or sleep well at night until he knows that all his animals are comfortable and everything is in its proper place.

An Hour's Work at Night in the winter season will often save two hours' work in the morning when everything is frozen up solid or is covered with snow.

Make the House Warm and Comfortable.—Provide proper ventilation, and make the doors and windows air-tight.

Horses that are working regularly need extra feed in cold weather. There is nothing better than chaffed hay and corn-meal.

Horses that are Driven Fast should have oats instead of corn-meal.

Farm Horses that are doing little or nothing can be well wintered on chaffed straw with a little corn-meal and bran, say 2 bushels chaff (16 lbs.), 4 lbs. bran, and 4 lbs. corn-meal each per day.

Cows are healthier in a deep, open shed than in a close, ill-ventilated stable. But a stable is much more economical of space, and it can be kept warm, clean, and well ventilated; and when this is the case the cows will require less food, or if they eat as much food will either give more milk or store up fat.

Liberal Feeding is usually the most economical feeding. It is a great waste of digestive powers to so feed a cow that she neither gives milk nor increases in weight; it is a still greater waste to so feed her that she must consume more or less of the fat and flesh previously stored up in the system. This is what happens when an animal weighs less in the spring than in the fall.

Cows that are well fed and kept in a barn stable should be carded with a curry-comb two or three times a week. It will pay in health, in looks, and in milk.

Watering Cows is an important matter. We for-

merly turned our cows out to water only once a day, but are now satisfied that it is better to turn them out twice a day. Be careful, too, that each cow has access to the trough, and that the "boss cows" do not keep the others away. Cows require much more time in watering than horses. Encourage them to drink by throwing a little meal on the water.

Salting Animals requires judgment. To let them go without for several weeks and then give them all they will eat is a bad practice, and sometimes a dangerous one. The better plan is to have rock-salt where the animals can lick it every day.

In Fattening Animals, the great aim of the feeder is to induce them to eat all they can digest and assimilate. How this can be best done depends on circumstances. Change of food will sometimes be attended with advantage and sometimes not. There is one general rule that should be borne in mind: When the animal is hungry, in the morning, feed the less palatable food, such as straw or stalks, and when the animal has eaten as much as it will then tempt it to eat more by giving more cut straw or stalks moistened and mixed with bran and meal. The food left in the mangers may be sprinkled with salt and water and put in racks in the yard, and when the cows are turned out to water they will be likely to eat it up clean.

Sheep are specially fond of clover hay. They will keep in good condition on this alone. But when straw is fed grain should be given in addition, say one pound each per day. We are now feeding our sheep (Cotswolds) twice a day chaffed oat and pea straw, all they will eat, ½ lb. bran, and ¼ lb. oats or peas, and 15 bushels of sliced mangels to 100 sheep. We feed mangels only once a day, at noon. We never had them do better. Merinos of course, being so much smaller, require less food.

When to Feed will depend a good deal on circumstances. Horses and cows should be fed early in the morning, say six o'clock. Sheep need not be fed until after breakfast, say seven or eight o'clock, and then again at four o'clock in the afternoon. They do not like to eat in the dark, unless it is a little in the middle of the night.

Swine, owing to low prices, have been much neglected. It is a good time to engage in raising improved breeds of pigs. The demand is now good, and is likely to be still better. Pork has advanced rapidly, and the prospects are favorable for a still further advance. Get a good breed, and give good care and feed, and pigs will be as profitable as any stock we can raise.

Work in the Horticultural Departments.

This month will witness the commencement of active garden operations in many localities. Nothing will so facilitate the work as to keep ahead of it, and even drive it; the moment our work begins to drive us, so soon do we find gardening, as well as other occupations, up-hill business. Now is the time to arrange all the necessary operations, so that the labors of the year may be carried on economically and intelligently. Every gardener ought to know at the commencement of each week what work is to be done; in this arrangement due allowance must be made for rainy days, and in-doors work provided for the help whenever it is possible. Order at once everything that can possibly be needed during the busy season. Seeds, trees, etc., if left until wanted, will in many instances be of inferior quality, as late in the season the stock of the best varieties is exhausted. A workshop in connection with a garden is almost a necessity, as many handy tools can be made during the winter and rainy weather.

Orchard and Nursery.

Much can now be done towards making the orchard look well during the summer.

Washing and Scraping can be carried on when mild days occur. A triangular plate of iron attached to a handle three feet in length makes a

handy implement for removing the loose bark from trees; the edges should be sharpened, but not enough to injure the fresh bark. The best material for washing after the trees have been scraped, is strong, soft soap thinned with water, so as to be conveniently applied by a brush; a solution of potash or soda will answer, but soap is better.

Manure.—Draw out at any time when convenient; it is better for the teams to have something to do during the winter. If left in piles of sufficient size in the field, fermentation will go on, except when the weather is very cold. See that plenty of absorbents are used in the stables; dry earth and leaves are the best materials for this.

Planting.—The time for planting must be governed, of course, by the locality; in the Northern states two months hence will be soon enough, while at the South a great deal will be done the present month. Nothing is gained by too early planting; better wait until the ground is thoroughly dry, as the trees cannot be injured if properly heeled-in in a dry spot.

Varieties must be selected according as they are intended for market or home use. Spring is the time for tree agents and peddlers to make their annual trips through the country. Do not buy from their showy colored pictures unless the varieties are known to be good, and even then it is a better plan to visit a neighboring nursery if there is such in the vicinity, where the varieties are kept true to name. There are agents who are undoubtedly honest in their dealings, but there are so many of the other sort that it is hardly safe to trust to them unless they are personally known.

Insects.—A constant fight must be kept up upon the various insects which infest the orchard and nursery. Tent caterpillars' eggs are easily seen now, and can be more readily removed than if left until they hatch. The female canker-worm will appear on mild days, and ascend the trees to deposit her eggs. There are many patents for preventing the ascent, but anything fastened around the tree which will serve as a barrier, will be effective, whether strips of paper covered with tar or printer's ink, or troughs containing petroleum.

Injured Trees must be looked after, and any limbs which have been broken by wind or ice removed, after which let the wound be carefully smoothed with a sharp knife, and covered with liquid grafting-wax, shellac varnish, or common paint. If any trees have been girdled by mice, the bark may be united by small twigs of the same kind placed at short distances around the trunk, so that the inner bark of the tree is brought in contact with the inner bark of the twigs, both at the top and bottom. Then a plaster of cow dung and loamy earth should be applied, and the whole bandaged with a cloth.

Cions.—Cut before the sap starts, and preserve in fresh sawdust or sand.

Grafting should be done only when the swelling buds show that growth has commenced. In many parts of the South this process can be carried on now, but the middle of April or first of May is early enough for most Northern localities.

Fruit Garden.

But little can be done here until later in the season.

Dwarf Trees may be pruned and afterwards washed with soft soap, as suggested under "Orchard and Nursery." The pruning can usually be done with a sharp knife if they have not been neglected too long. The principal pruning necessary will be to bring the trees into proper shape.

Grape-vines.—Prune during mild days, if not attended to in the fall.

Blackberries and Raspberries.—Set as soon as the condition of the soil will allow, as the underground shoots start early, and are often injured if their removal is left until late. Provide stakes or wire trellises for tying up the canes.

Currants and Gooseberries.—Cut out the old growth and shorten the new so that plenty of light

and air may be had to insure the proper ripening of the fruit growing in the centre of the bushes.

Trellises for grape and other vines will be needed, and they may be made during stormy weather.

Posts should be cut and prepared for use in and around the garden; locust and red cedar make the most durable.

Kitchen Garden.

Every one who has a piece of ground, even though it be only a city lot, can have a constant supply of some of the choicer vegetables if a little effort is made in this direction. Most persons would be surprised to know the quantity of vegetables which market gardeners grow upon their small plots, and though it is not expected that all will do as well, yet on a very small area properly cared for, a great many of the garden luxuries could be grown. Lettuce, cucumbers, radish, tomatoes, egg-plants, etc., are a few of the things which are raised easily. At the South cabbage, lettuce, onions, parsnips, beets, etc., may be sown at any time during the month. The tenderer varieties, however, must not be put in until settled warm weather.

Manure is one of the necessities of the gardener as well as the farmer, for without it no adequate returns can be had. Every precaution then should be used to preserve and increase the quantity. With a little care the amount may be increased very largely. Absorbents should be used in the poultry-yards, around the stables, and in the pig-pen. If the manure-pile is turned occasionally, and the house slops poured over it, fermentation will be more active, and the pile better rotted, and consequently more useful for the immediate needs of the crops. Save the horse manure in a separate pile, where it can be easily got at when wanted for making hot-beds.

Straw Mats.—During cold and stormy days, when there is no chance for out-of-doors work, make a supply of straw mats for covering frames and hot-beds, to protect plants from too much sun and from frost. Use rye straw, making the mats 7 feet long and 4 1/2 feet wide, so that two will cover three sashes. The best plan is to take five strands of tarred twine the proper length, then lay the straw on an inch thick, placing the butt ends towards the edge of the mats. After this, take five other strands and lay them directly over the first ones, and with a needle and twine sew through the straw, taking care that the loop catches both strings. When the whole is completed, the edges of the straw can be cut straight, and the mat is ready for use. Always store in a dry place under cover when not in use.

Cold Frames will need considerable attention now to supply plenty of air. Remove the sashes entirely when the weather will allow.

Hot-beds will not be needed except by market gardeners before another month, unless very early vegetables are wanted. Shelter should be provided at the side from which the prevailing winds come to keep the wind from blowing directly upon beds.

Brush and Poles for peas and beans should be cut early, trimmed and sharpened; place near where they are to be used.

Root Crops left in the ground during winter may be dug as soon as the ground will allow.

Rhubarb.—Apply a thick dressing of fermenting manure to the bed to induce an early start. A few roots for forcing may be taken up and removed to a hot-bed, and supplied with plenty of fermenting manure.

Flower Garden and Lawn.

The beauty of a flower garden consists in having a different arrangement of plants each year. Where the same varieties are planted year after year, with no change in the grouping, a garden soon loses its attractiveness. With a little forethought this difficulty can be done away with.

Lawns.—Roll as soon as the frost is out of the ground, and if not top-dressed last fall apply a compost of fine manure or bone-dust and ashes.

Plants in Pits or Cellars.—Give air every warm

day, or else they will become sickly and drawn, now that the sun is more powerful. Water only when the soil looks dry.

Dahlias and other roots stored in cellars must be looked after, to see that they do not rot from too much dampness. If any signs of mould or rot occur remove to a dry room.

Shrubs.—Prune and thin when the weather is mild enough. Cut back those varieties which flower on the new growth to proper shape. Where the flower buds are already formed only the crowded growth should be cut out.

Rustic Work.—Give a coat of petroleum to protect from the weather. Make any new trellises or rustic work needed now in order to have everything ready for use as soon as required.

Walks.—Clear up all rubbish which has accumulated and roll when the frost is out.

Greenhouse and Window Plants.

Care must be used with the fires, as during mild weather they are apt to be neglected, and a sudden change may cause a great deal of damage. Never let the fire go entirely out; if very warm a few cinders or ashes placed on the fire will prevent its burning rapidly.

Camellias and Azaleas coming into flower require more heat and water. Never sprinkle the plants when in bloom, as the water injures the flowers.

Window Plants will need showering to remove the dust; some of the plants with thick leaves can have the dust removed with a sponge.

Bulbs.—Continue to bring these from the cellar to keep up a succession. As fast as the flowers fade remove the flower stalks and gradually dry off. Those flowered in glasses are not worth keeping, as several years are needed before they will recover from the effects of forcing.

Propagation.—Plants needed for sale or planting in the flower garden and borders may be propagated this month. The temperature of the air of the propagating house should always be lower than that under the cutting bench. This is usually effected by means of boards arranged so as to confine the heat under the benches.

Annuals.—Sow a few boxes for early flowers, and for planting out.

Re-pot such plants as have filled the pots with roots, and all intended for specimen plants.

Climbers.—Tie these up to wires; climbers will serve a good purpose for shade for other plants. Passion-flowers, wax-plants, roses, etc., are all very good for greenhouse use, as they are of easy culture.

Insects.—Fumigate often to kill the green-fly. The plants should be thoroughly syringed the morning after smoking.

Forcing.—Deutzia gracilis, and Astilbe Japonica are good plants for forcing. They should be brought into heat early this month.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, from our daily record during the year, show at a glance the transactions for the month ending Jan. 13th, 1874, and for the corresponding month last year, also for the year ending Dec. 31, 1873:

Table with 5 columns: RECEIPTS, SALES, TRANSACTIONS AT THE NEW YORK MARKETS. Columns include Flour, Wheat, Corn, Rye, Barley, Oats. Rows show monthly and yearly data for 1874 and 1873.

4. Receipts at head of tide-water at Albany each season to Nov. 30th.

Table with 6 columns: Flour, Wheat, Corn, Rye, Barley, Oats. Rows show monthly receipts for 1873, 1872, 1871, 1870, 1869, 1868.

5. Receipts of Breadstuffs in New York in each of the last six years:

Table with 6 columns: Flour, Wheat, Corn, Rye, Barley, Oats. Rows show monthly receipts for 1873, 1872, 1871, 1870, 1869, 1868.

6. Exports from New York, Jan. 1 to Dec. 31:

Table with 6 columns: Flour, Wheat, Corn, Rye, Barley, Oats. Rows show monthly exports for 1873, 1872, 1871, 1870, 1869, 1868.

7. Comparative Stock of Flour in New York, Jan. 1:

Table with 4 columns: 1871, 1872, 1873, 1874. Rows show Western and State Flour, Canada Flour, Southern Flour, California Flour, Grand total.

8. Comparative Stock of Grain in New York, Jan. 1:

Table with 4 columns: 1871, 1872, 1873, 1874. Rows show Wheat, Corn, Rye, Barley, Oats, Malt, Peas.

CURRENT WHOLESALE PRICES.

Large table with multiple columns: PRICE OF GOLD, FLOUR, WHEAT, CORN, RYE, BARLEY, OATS, etc. Includes prices for various grades and types of goods.

Gold has been up to 112 1/2 closing January 13th at 111 1/2 as against 109 1/2 on December 12th. The dealings in most kinds of Produce have been on a more liberal scale since our last, and the prospect at the close is much more encouraging for mercantile interests generally. There has been an active trade in Flour, especially in shipping and trade extras, at improved prices. Wheat has been in much better request, chiefly for export, advanced rates, but closed tamer, and 3c. @ 6c.

bushel off highest figures for Spring. Corn has been offered very sparingly, and with a brisk inquiry, largely speculative, has been quoted decidedly dearer. Oats and Barley have also been actively sought after, and prices have favored sellers, closing buoyantly. Provisions have attracted more attention, but closed quiet and somewhat unsettled. Cotton has been selling freely at buoyant rates. Wool has been in more request at improved prices, closing firmly. Hops, Hay, Straw, and Tobacco have been selling moderately, on a general steady basis as to values. Seeds have been quoted higher, with a readier market noted, particularly for prime Clover for export purposes.

New York Live-Stock Markets.

				74	1,716	30,337

Bees.—The irregular receipts of last month have created a somewhat irregular market, and prices have changed up or down with less or greater supply. The year's business closed up with receipts of 442,744 head, against 425,375 head for 1873 and 380,934 for 1871. The closing prices of 1873 were fully 1½c. to 2c. lower than a year previous, and premium cattle dragged at the price of extra, bringing 13½c. against 15½c. a year ago. During the last month the prices have been maintained only by moderate supply, and gave way whenever the supply equaled the demand. Prices may be marked down fully ½c. during the month; choice steers selling at the close at 12¼c. @ 12½c. @ 13c. @ 14c.; first quality steers at 11½c. @ 12c.; native cattle, oxen, and cows, 9c. @ 11¼c.; and Texans at 7½c. @ 10½c.

Prices for the past five weeks were:

WEEK ENDING	Range.	Large Sales.	Aver.
December 15....	7 @ 13½c.	10½ @ 11¼c.	10¾c.
December 22....	7 @ 13½c.	10 @ 11c.	10½c.
December 29....	7½ @ 13½c.	10½ @ 11¼c.	10¾c.
January 5.....	7½ @ 13c.	10 @ 11c.	10½c.
January 12.....	7½ @ 12½c.	10 @ 11c.	10½c.

Milk Cows.—There has been fair inquiry for good cows, with light supply, and prices have remained steady. \$90 was paid for an extra cow and calf, but the range has been from \$40 to \$80 for cow and calf. **Calves.**—For this stock we have no change to remark; the supply has fallen off since last month nearly one-half, yet there has been no advance in prices to notice. Fair milk-fed calves sold at the close for 8c. @ 11c. @ 12c., and grassers at \$6 @ \$12 @ head. Hog-dressed calves are arriving and selling at 10c. @ 13c. for milk and 5c. @ 9c. for grass and fed. **Sheep and Lambs.**—The arrivals are below the average, and, with good demand, the quotations are advanced somewhat, but the market is dull. Prices at the close reached 5½c. @ 7½c. @ 8c. for ordinary stock; 7½c. @ 7½c. for selected; and 8c. for fancy Canada wethers. **Swine.**—Prices have again advanced, with continued light receipts, although the market has been constantly dull. Live hogs were quoted nominally, without sales, at the close of the week at 5½c. @ 5½c. @ 6c. Dressed hogs were moving uneasily in an unsettled market at 6½c. @ 6½c. for Western, and 6½c. @ 7½c. for City.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money:—Checks on New York City Banks or Bankers are best for large sums; make payable to the order of Orange Judd Company. Post-Office Money Orders for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

Postage: On *American Agriculturist*, 12 cents a year, and on *Hearth and Home*, 20 cents a year, in advance. Double rates if not paid in advance at the office where the papers are received. For subscribers in British America, the postage, as above, must be sent to this office, with the subscription, for prepayment here. Also 20 cents for delivery of *Hearth and Home* and 12 cents for delivery of *American Agriculturist* in New York City.

Bound Copies of Volume Thirty-two are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the last seventeen volumes (16 to 32) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Clubs can at any time be increased by remitting for each addition the price paid by the original members; or a small club may be increased to a larger one; thus; a person having sent 10 subscribers and \$12, may afterward send 10 more subscribers with only \$3; making a club of 20 at \$1 each; and so of the other club rates.

Our Fine Chromos.—Read all about them on third cover page. It is easy to secure one or both.

FREE.—Fine Gold Pens, with Silver Cases—The Best Silver-plated Table Articles—Table Cutlery—Children's Carriages and Toys—Floral Sets—Garden Seeds and Flower Bulbs—Sewing Machines—Washing Machines and Wringers—Pocket Knives—Fine Gold and Silver Watches—Melodeons—Pianos—Guns and Rifles—Cultivators—Books—etc., etc.; all these are among the valuable articles to be found in the Premium List for 1874 on page 73. Any person can, with a little effort, secure one or more of these valuable articles. Thousands have done it. There is room for thousands more. It is very easy to obtain clubs of subscribers for the two popular papers, the *American Agriculturist* and *HEARTH AND HOME*. Try it.

See Pages 73 and 74.

Take Both Papers.—If both the *American Agriculturist* and *HEARTH AND HOME* are taken together they may be had for only \$4, and \$4.50 pays for both papers and a Chromo with each.

The German Agriculturist is published at the same price as the English edition, and is mainly a reproduction of that paper, with a special department edited by the Hon. F. Münch. Will our readers kindly mention this to their German friends? Perhaps some who employ Germans as gardeners, laborers, etc., would be glad to supply them with useful reading matter by subscribing for the German edition for them.

Farms for Premiums.—A most liberal offer of farm lands as Special Premiums is made by the Publishers to those who will secure clubs of subscribers for the *American Agriculturist* and *HEARTH AND HOME*. See particulars on fourth cover page of this paper.

Henry A. Dreer.—The announcement of the death of this most estimable man came upon his friends with a startling suddenness. He died at his residence near Philadelphia on the 21st of December last of a disease of the heart. Mr. Dreer was one of the leading seedsmen of the country, and at the same time an enthusiastic lover and cultivator of plants. He was an influential member of the Pennsylvania Horticultural Society, and as he was also eminently a working member, his helpful presence will be sadly missed by that body. Of a singularly even and genial temperament, he made hosts of friends, and his strict integrity secured him the esteem of all who had business relations with him. We learn that the business will be continued under the same name by Mr. Dreer's son, Wm. F. Dreer, and his nephew, Wm. H. Smith, who have been associated with him for several years.

The Use of Postal Cards.—The Russian who when he first saw a pair of snufflers thought them very handy, as he illustrated by snuffing the candle with his fingers and putting the snuff into the snufflers, has passed into history. He is rivalled in a degree by the American who found postal cards a great convenience, as he had only to write his message on it, put it into an envelope and send it off without any trouble. We have a correspondent who excels both in ingenuity. He encloses us six postal cards with a distinct question upon each, and asks us to answer "through the *Agriculturist*." To make the matter sure he scratches out his address from his letter and fails to put it on the cards.

SUNDRY HUMBUGS.—A gentleman in Philadelphia incloses us a circular of the Louisville, Ky., Library Lottery, and asks us if it is a humbug. It is probably no more so than any other lottery. We hold that

ALL LOTTERIES ARE HUMBUGS,

no matter how fairly managed. Their main object is to make money for their proprietors, and the pretense of benefiting some public or charitable institution is a mere bait. Within the recollection of many, lotteries were tolerated, and even legalized, in almost every state in the Union, but of late years the moral sense of the community has demanded that they be suppressed, and now most states have laws prohibiting them. Take this Louisville affair, for instance, which seems to be profitable, or it would not be kept up so long; we showed a year ago, in a quotation from a Louisville paper, that the purchasers of tickets paid nine dollars to put one dollar into the library fund. Then here is the Gift Concert for the Reform School of Leavenworth, Kansas, which we have already noticed, and which is mainly a plan to help the projector to sell his house at a good price, that being one of the prizes. Even Utah has gone into the lottery business, and proposes a "Gift Concert" for the benefit of a free school in the city of Corinne. No matter under what pretense these things are advertised—and we consider those cloaked under charitable disguises more reprehensible than bold and barefaced lotteries—they all hold out temptations, that the few may get something at the expense of the many. It is gambling in its meanest form; and no honorable man, whether he be governor, mayor, merchant, or priest, should allow his name to be used to promote any such scheme.

THE \$4 GENEVA WATCH

dealers have received a check. We have long had them in our list of humbugs, but now the law has interfered with their little game. The watches were advertised by J. Wright & Co., 609 Broadway, but the Post-office authorities found that letters thus directed were received by one Robinson at 599 Broadway, and that the real place of business—if business it could be called—was at 49 Amity street. Here the letters were opened, the money taken out, and a circular dispatched informing the sender of the money that his order would be filled in turn. Robinson has been arrested and bailed in \$35,000, to appear for trial upon the charge of getting letters from the mail under false pretenses.

DANGEROUS BURNING FLUIDS.

We have before set forth the dangerous character of several of the articles offered as cheap illuminators. That these will give an excellent light and at a low cost, we do not doubt; but we feel it a duty to warn all our readers not to use benzine, naphtha, gasoline, or any of these light oils in any form; no matter how compounded or mixed up, they are dangerous in themselves and dangerous in all their compounds. Nothing is safer than gunpowder in the hands of an old hunter, because he knows its danger; but he would not trust his children with it. These articles will not themselves explode, and those who sell them convince the ignorant that they are safe by showing that they will extinguish a lighted match. But the trouble is with the vapor which they give off at ordinary temperatures, and this, when mixed with air, is highly explosive and dangerous. No liquid is safe to burn that gives off a vapor that will flash at a lower temperature than 110°.... "I. I. A." sends us a circular of a "Chemical Fluid Gas Light," and asks our opinion, but as he does not send the formula, we can only say that, from the circular, we infer it is no gas at all, but merely a contrivance for burning the vapor of some highly volatile and consequently dangerous liquid.

DUBIOUS CASES

are more numerous this month than usual. We have a pile of circulars, in some of which goods are offered at remarkably low prices, generally requiring \$5 to be sent with the order. In others all sorts of knickknacks are offered for sale by agents who are requested to send a sum to procure an outfit, and others offer to sell at a very low rate the secret of making wonderful perfumes, medicines to cure various diseases, hair restorers, and the like. While it is probable that any one who invests in any of these enterprises will regret it, we can not show that the proprietors will not do as they agree to, and we are not warranted in setting them down by name as humbugs. We have complaints against one of these concerns from persons who write us that they have sent money to one of these "companies" and got no return. Not finding the name in the directory, we sent one of our associates to the place advertised, who found the "company" in an obscure upper room, with samples of the goods they send out, and several persons busy in preparing circulars for the mail.... After all that has been said upon the matter, we can not feel a great deal of pity for persons who send money to unknown parties and receive no returns. People should recollect that no really good article is ever

sold in New York or anywhere else for much less than it is worth, and that whoever offers articles for half their usual price or less, either came by them dishonestly, the articles are not what they are represented to be, or they are offered as a bait to cover some ulterior design.

MEDICAL HUMBUGS.

"P. M.," of Greencastle, Ind., finds fault because we do not show up Ayer, of Lowell, and several others in our humbug column. While we do not approve of the manner in which Mr. Ayer introduces his medicines, he does not keep the composition of them a secret, but publishes the formula; and as we have no doubt that he furnishes precisely what he agrees to, we can not class his medicines among the humbugs. There are a great many proprietary medicines sold which are in themselves good and useful. The objection to them is that they tempt people to medicate themselves and to dose themselves when no medicine is needed. We therefore think that, so far as this goes, such medicines are to be discountenanced; but they stand upon a different footing from those sent out by the miserable quacks who promise everything and give a useless or worse than useless stuff.

EYE-CUPS AGAIN.

Of all the special organs by which the brain receives impressions from the outside world, none is so wonderful in its structure or so delicate and so sensitive as the eye. When it is deranged it requires the greatest skill to ascertain what the trouble is and to properly restore it to usefulness. The sellers of these eye-cups themselves claim that they do only one thing—restore the lost convexity of the eye. It is a box-wood or other cup to put over the eye, to which an india-rubber bag is attached. By squeezing the bag and placing the cup over the eye, a pressure from within, outward, is created, which these people claim will restore the proper shape. Now, but very few of the derangements of the eye are due to any disturbance of the shape. Some are, but there is not the slightest reason to believe that these eye-cups will help them. It is astonishing that people who would not think they knew enough to repair a broken coffee-mill will tinker with their own eyes. We have the highest authority in the country for saying that these eye-cups are wrong in principle and mischievous in practice.

THE NATIONAL SURGICAL INSTITUTE

is on its travels. It has been to California, and we have a show-bill announcing that it will be at Salt Lake City and Denver on certain days. This circular—we beg pardon, "journal"—is a curiosity, and quite beats one of Barnum's circus bills. Two large pages are used to show all possible human deformities, with the poor creatures in every possible kind of harness. The contrasted figures of patients as received and as dismissed beat the writing masters' specimens of the chirography of pupils before and after taking lessons. The array of deformed and ulcerated feet and limbs is repulsive beyond description. These institute people claim to be M. D.'s. The more shame for them. These

"INSTITUTES AND UNIVERSITIES"

are great things. We have several of them in New York. Sometimes one man calls himself a university or an institute, and then it happens, though rarely, that one of these quack chaps really does get, by some hocus-pocus, a charter from the legislature. One of these lovely concerns is the

CLINTON MEDICAL AND SURGICAL INSTITUTE,

which is run by one James Bryan. This Bryan obtained a charter in which are mentioned as incorporators Dr. John Harvey, Dr. Robert Bell, Prof. Wm. Draper, and others. It will be noticed that these are names well known in the medical world, and are chosen with great ingenuity. Mr. Bryan has been summoned by the attorney general of the state of New York to show cause why his charter should not be forfeited, as these incorporators can not be found, and it is charged that no such persons exist. If the charter should not be forfeited on this account, it should for the vile character of the publications of the "Institute." We have before us a small volume entitled, "Things You Ought to Know," made up of essays by associates of Bryan and aliases, which is about as vile as anything among the many vile publications that have fallen into our hands. Each essay is followed by advertisements of certain remedies, or that of the "Institute." Madame Lucille Demarre's discourses of "Marriage Socially Considered," and follows it with an advertisement of her "Eau d'Amour," or "Perfume of Love," which is a most remarkable smell, as we read: "With this celebrated article as a helper, no young gentleman or lady need pine in single blessedness. With its help they can win the unchanging affection of whom they please, and marry happily and speedily, if so desired." Then comes "Prof. W. Draper, M.D.," with his "Philosophy of Marriage," with advertisements to match. This "Professor" advertises,

among other things, the "Cordial of Venns," the uses of which a regard for decency prevents us from stating. "Dr. John Harvey" writes about a "Womanhood," and advertises, from this very "Institute," female pills, the real object of which is more thinly disguised than usual. There are other things offered in this vile work of which virtuous people do not know, and which it would hardly be proper to name. This Bryan, with his male and female associates or aliases, whichever they may be, is properly under the eye of the authorities. His case should induce the legislature to be careful to whom they grant charters, for more vile and pernicious quackery never existed than is practiced by this chartered "Institute."

COUNTERFEIT MONEY.

For the first time in many months we have only one new name as a dealer in "Queer." This is sent by a correspondent in Kansas, who proposes to write to the chap and have us meet his appointment with an officer. This would not be of the slightest use. The man could not be arrested unless he passed or sold counterfeit money, or had it in his possession. It is not probable that any of these chaps make or have any counterfeit money—they are quite too sharp for that. Their object is to get a victim into their hands; they make a bargain with him, get his good money, and put a parcel of paper into his hands which turns out to be no counterfeit money at all. The victim does not dare to "squawk," for he has already made himself a party to a criminal transaction, and he can not make a complaint without admitting that he was ready to go into the counterfeit money business. If any get caught in this trap they are rightly served. The real dealers in counterfeit money are not such fools as to write letters and send out circulars. These chaps who pretend to do it know that the cupidity of some will lead them into their trap, and when once in, their fears will keep them quiet. Some interesting cases are now in the hands of the courts, and when they come to trial we may expect some developments that will be worth noticing in our "Humbug" column.

Broom Corn.—"R. F. S.," Beech Grove, Ind. It is no more trouble to raise broom corn than ordinary field corn. The cultivation is the same, and the harvesting and drying is no more trouble, if so much, as husking and cribbing corn. The best variety is the Missouri evergreen, and the method of cultivation and preparation is described in the *Agriculturist* of May, 1873. A little pamphlet has been written upon this subject by R. A. Traver, of Charleston, Illinois, which contains much valuable information.

Artificial Fertilizers.—"D. H.," Burlington, Ct. The labor of making composts of artificial fertilizers and loam will hardly pay. The composting may be done far cheaper by spreading the fertilizer upon the soil and mixing it with a light harrowing. For sown crops the seed and fertilizer should be harrowed in together. Superphosphate very often fails of any noticeable effect when used upon soils containing lime. The acid or soluble phosphate forms an insoluble compound with the lime. This is what is termed "going back," and suffices to explain many disappointments. Muck is best composted with lime, or, better still, used as an absorbent in the stables and yards.

L. Wright's "Brahma Fowl."

"F. W. B.," New Haven, Ct. This little work is a "true account" of the Brahma fowl, its origin, its character, its habits, its value, and the best method of breeding to preserve all its excellences up to the proper standard. It is equally devoted to the light and dark Brahmas, is handsomely illustrated, and is sold for \$2.50.

See Pages 73 and 74.

The American Cyclopædia.—Appleton's Cyclopædia is one of the most important works ever issued from the American press. The first edition, which was completed in 1863, found a place in every considerable library; indeed it was a respectable library in itself. The publishers are now bringing out a new edition, which like the former will be comprised in 16 volumes. It is, like the first edition, under the editorial charge of Messrs. George Ripley and Charles A. Dana. All the articles are thoroughly revised and mostly rewritten, with many new ones added, so that though the plan is the same it is essentially a new work. The first four volumes which we have received show a great improvement in the mechanical appearance of the work, and illustrations and maps are introduced where the subject requires them. There is no work of its kind so valuable to the American reader as this, as it gives special prominence to American matters, and biographical sketches of prominent persons still living. The various topics are treated by eminent specialists, and in a popular and at-

tractive style. As far as we have examined the work it appears to be still more valuable than the first edition. Although this edition has been announced, but a short time, we learn that the sales have been very large.

Henderson's Practical Floriculture.

—This work has had a large sale for one of its kind, and deservedly so, as it is the only one in the language which gives plainly and without any reservation the practices and processes of those who grow plants as a business and avail themselves of every economical and labor-saving expedient. There are some florists who keep their operations a secret; that this is bad policy is shown by the course of Mr. Henderson, who has always freely communicated the "secrets" of his business in his articles to the *Agriculturist* and other papers, and especially in his books. Instead of injuring his business by telling others how they can go and do likewise, he has constantly increased it. He feels, as every florist should, that next to the pleasure of discovering a "new wrinkle" is the telling of it for the benefit of others. A new and much enlarged edition of "Henderson's Practical Floriculture" has just been issued by the Orange Judd Company. This, while it is a work indispensable to those who raise plants for sale, contains much that is given for the special benefit of the amateur cultivator. Though the number of pages is considerably greater than the old edition, the price remains the same as before, \$1.50.

What we Call Mean.—

That the publishers of papers should have been, in common with other business men, embarrassed by the late panic is not surprising, and we consider it essentially mean that when one of our agricultural cotemporaries was pinched more closely than was pleasant, some other agricultural papers took special pains to give publicity to the matter, not only by comments of their own but by quoting items in relation to it from other papers. A fair rivalry we believe in, but to endeavor to turn the misfortunes of another to one's own benefit is a meanness of which we are sorry to say some journals have been guilty. If the publisher in question had failed to fulfil his agreements with his subscribers that would have been another matter, but so long as his paper was furnished as good and as regularly as ever we can not see whose business it is to interfere in the matter.

The Gardener's Monthly opens the

year with a number of unusual variety and interest. The editor gives Recollections of Travel, which being an account of a journey made last summer, lacks the freshness of the rest of the number. It is so seldom we catch our friend Meehan napping (even Jove nodded though) that we like to pick him up when he gives us a chance. In speaking of the route between Texas and the Indian territory he says, "The line was very gay with the large brush-like heads of *Cenotaura Americana*, a beautiful annual which it is surprising has not yet got into cultivation." This plant, the common name for which is American Star-Thistle, we grew a dozen or more years ago, and the seeds are to be found in the catalogues of all the principal seedsmen, those of Philadelphia included. If our friend had studied his *Agriculturist* with the care that becomes every one, especially horticultural editors, who wishes to know what is going on, he would have learned that a new variety of this Star-Thistle was introduced into England last year.

The Michigan Agricultural Col-

lege.—The New York Evening Post says: "It is proposed to make daily manual labor compulsory upon the students at the Michigan Agricultural College, and some of the kid-gloved young farmers protest."—Manual labor has always been required of the students, except in case of sickness or disability, and the young men at the college, while they can no doubt wear kid gloves as well as any other gentlemen should the occasion demand it, are as hard-working a set of young farmers as can be found anywhere. But this is about as near to the facts as the daily papers get when they meddle with agricultural matters.

Wool.—

During all the fluctuations of value consequent upon the recent financial crisis, now happily in a great measure passed over, the market value of wool remained almost constant. "Domestic fleece" was quoted in the New York market on September 10th at 48 cents per pound; exactly the same quotation was current on November 29th, while almost all other staples except grain, cotton amongst the rest, had greatly declined. The fact that wool, wheat, corn, and oats thus retained their value amidst the most unfavorable circumstances goes to show that agriculture is the most stable of all the industries, and while all else may be going to wreck the farmer alone can afford to contemplate the disaster with comparative serenity.

A Kansas Homesteader.—Abraham Difenbaugh, Hutchinson, Reno Co., Kansas, settled upon 160 acres of land four miles from that town in April, 1872. He is a miller, and was unacquainted with farming; his success therefore is the more encouraging. He broke up the first season 100 acres, and put part in sod corn which did well. The remainder of the season was occupied in building and planting trees. The past season (1873) he had 80 acres of corn which produced 40 bushels per acre; 4 acres of wheat produced 80 bushels; and 10 acres of oats produced 450 bushels, which were sold for 30 cents a bushel. Wheat brought \$1 a bushel. Potatoes, cabbages, tomatoes, melons, and pumpkins, yielded very largely. He has sown 45 acres of fall wheat this season, which looks splendid. He has 200 apple trees and 25 cherry and peach trees, all doing well. All the work above mentioned has been done by himself and his son, a boy of eleven years, and the expenditure of \$40 in money. Mr. Difenbaugh kindly offers to give any advice or information to those who write to him for that purpose. Persons thus writing should, of course, inclose a stamped envelope for reply.

Land Sales.—The Atchison, Topeka, and Santa Fe Railroad Co. have sold from April, 1873, to October, 87,963 acres of land, at an average price of \$5.50 per acre. For October last the sales were 23,676 acres.

Soiling Cattle.—“H. D.,” Shipley, Ohio. There is no more economical mode of feeding cows for the dairy than soiling; that is, growing crops to be fed in the stable, the cows to be not pastured but exercised in a small yard daily. By this system, one cow can easily be fed the year round from the product of one acre of rich soil, and the manure saved is equal, including the litter, to one load per head per month. “Quincy upon Soiling Cattle,” price \$1.25, to be had at this office, is the best work upon this subject.

Wheeler's Anti Snow-balling Pad.—“I. B. S.,” Napanock, N. Y. This pad is an entire preventive of the gathering of snow-balls in the horse-shoe. It can be affixed by any person without the aid of a blacksmith, and we can confidently recommend it from personal experience with it during a whole winter.

Gail Borden died in Texas on January 11th, at the age of 72. His was a very varied and useful life. He was a settler in Texas before its independence, resided at the North for several years later in life, and again went to Texas, where he was actively engaged in developing the resources of the country when he died. He is best known to the public as the inventor of meat biscuit, condensed milk, condensed beef, etc. Through these inventions he had a handsome income, which he freely used for benevolent objects. Personally, Mr. Borden was a most genial old man, and his too rare visits to our office were always productive of pleasure.

“H. S. D.,” Thompsonville, Pa. We wrote a reply to your inquiry, and when about to address the letter found you had not given your name. We have frequently given notice that those who do not give us full name and address need not expect a reply in the paper. More comply with our regulations than we can find room to answer, and those who do not observe our repeatedly published terms can not expect to have preference over those who do. As this was a merely personal matter, we took the trouble to write an answer by mail, and do not find it pleasant to know that our time has been wasted.

See Page 75 for other “Basket” items.

Patrons of Industry.—This appears to be a weak imitation of the Patrons of Husbandry, the constitution and forms belonging to that order being mainly copied. Its ostensible object is to unite mechanics and laboring men in a body like that of the Patrons of Husbandry, but its real object seems to be to transfer money from the pockets of those who earn it to those of people who live by their wits. The headquarters is advertised as being in New York, but we have not yet seen any one who has succeeded in finding the head men. It looks like a concern that will do no harm if let alone.

The American Dairymen's Association.—The annual convention of this association was held at Utica, N. Y., on the 13th, 14th, and 15th of January. Although not so numerously attended as in some previous years, there was no lack of interest exhibited, and the papers read were of more than usual excellence. Amongst the more important of these were a paper upon “Butter Making,” by O. S. Bliss, of Vermont; one upon “Making and Marketing Butter,” by L. T. Hawley, of Syracuse; one upon “Experiments in Cheese Making,” by Mr. Green, of Pennsylvania; an-

other by X. A. Willard upon “Dairying in the West and South-west,” with others of equal interest to dairymen. The discussions elicited by the reading of these papers were eminently practical, and were made in a vigorous and lively manner. We regret that our space is too limited to do more than mention the bare fact of the meeting of this important convention, and would inform our readers that the papers at full length will be published by the association, and may be procured of the secretary, L. B. Arnold, of Rochester, N. Y., for 75 cents for the volume.

Forestry Memorial.—A committee appointed by the Farmers' Club, of the American Institute, have drawn up a memorial asking Congress to pass laws to preserve our present forests from destruction, as well as to encourage the planting of trees where none exist. Some of the things it asks of Congress are all right and proper, while others are not especially useful, such as asking it to publish the literature of Forestry in the form of public documents. There are no works so difficult to be obtained by those who need them as those published by Congress. Public documents always go where they are not wanted and seldom where they are; and we know of no way by which to thoroughly bury a work on Forestry or any other subject than to have it sent to the public printer—unless it may be to have it read before the Farmers' Club. Mr. George May Powell is the principal mover in this matter, and is, as we understand, a gentleman who has devoted much attention to the forests of this and other countries. He will be wise if he acts by himself, as he can accomplish much more than with such a load as the Farmers' Club to carry.

How to Carry a Ladder.—“E. W.,” Elwood, describes how Farmer W. carried home a long ladder which he had borrowed, and which was supposed to require four men to carry it. He balanced the ladder upon his wheelbarrow and lashed the sides of it to the handles of the barrow; then taking the end of the ladder, he wheeled it along with comparative ease.

Improving Fence Posts.—“R. McC.,” Although we can not say from personal experience, yet we have no doubt that fence posts would be made more durable by thorough soaking in lime water. It is the alumen of the timber which soon decays and causes the timber to rot, and the effect of lime is to solidify the alumen and render it insoluble. This effect would be produced upon fence posts as well as upon boards or planks, but the exposure of the posts to the lime would need to be for a longer period than that for thin boards.

Butter Packages.—“M. A. H.,” Dover, N. J. We have on previous occasions referred to the great need of small packages for butter, which would hold such quantities as would be sufficient for the week's consumption of a family, say two to five pounds. Here is a great field for the exercise of ingenuity, and the inventor of an acceptable package of such a shape that several of them could be packed into one larger one would certainly meet with much profitable encouragement.

Hog Cholera.—“A Kansas Farmer,” Linn Co., Kansas, says he has cured hog cholera by sprinkling fine lime-dust around his hog pens and upon the corn fed to the hogs.

Potato Planter.—“C. P. K.,” Northport, L. I. There is a machine which makes the furrow, cuts, drops and covers the seed, known as True's potato planter. The manufacturer of these machines will probably make his address known in the usual way before the season for using them arrives.

Castor Beans and Oil.—“J. M. M.,” Emporia, Kansas. The culture of castor beans is the same as that needed for corn. In harvesting it is necessary to gather the beans before they are ripe, and spread them upon a smoothly swept piece of ground surrounded by a board fence to prevent the beans from flying when the pods burst open. In making the oil the beans are ground into a paste, which is put into hair cloth bags and pressed beneath strong screws or wedges. The first oil is known as “cold drawn.” The cake is then pressed between heated plates and yields an inferior second product. There are several mills in St. Louis where the oil is manufactured. The refuse is a valuable fertilizer, but is of no value for food; it is in fact injurious to cattle.

Lard Oil.—“J. S.,” Logansport, Ind. The apparatus required is so expensive and cumbersome that a farmer could not make his own oil except at great cost.

A Fine Head of Spring Wheat.—A correspondent of the *American Agriculturist* at Fidalgo Islands, Washington Territory, sends us a head of Aus-

tralian spring wheat. “Please count the grains,” he writes, “and see if it will yield as many grains as the head of Diehl wheat which John Johnston sent to ‘Walks and Talks.’ I counted the grains in two heads, one had 103 and the other 126. I think the heads will average 75 to 80 grains. The wheat was raised on this Island.” The head sent us was remarkably handsome. There was nothing abnormal about it, as is sometimes the case with a very large head of Diehl. We counted the kernels in the head, and found 96. The grains were large and plump, and nearly as white as an average sample of Diehl. We should be glad to know the yield per acre, time of sowing, harvesting, etc. We may add that the head of Diehl raised by Mr. Johnston contained 65 kernels; those alluded to by “Walks and Talks,” one 80 kernels and the other 88 kernels.

Manure for Potatoes.—“Hartford.” Potatoes succeed best with thoroughly rotted manure in which no more fermentation can take place. A very excellent compost for potatoes is swamp muck, bone-dust, and plaster. One load of muck, 100 pounds of fine bone-dust, and a bushel (80 lbs) of plaster make a very useful fertilizer when stable manure can not be procured. Fish guano makes a good substitute for the bone.

Value of Leather Scraps.—“Concord,” Winterset, Iowa. Leather scraps are a very valuable fertilizer. The best way to utilize them that we have discovered is to bake them in an oven until they become quite brittle, and then to pound them with a wooden stamper or a flail upon a barn floor. In this way any waste leather may be made useful. They furnish an acceptable fertilizer for grape-vines, and may be hoed in around the roots.

Sowing Grass in Spring.—“Chasseur,” Washington, D. C. If a crop of rye is an object, and the land is not desired to lie idle a whole year, which would probably be injudicious anyhow, spring rye might be sown, and timothy and clover be sown with it. The rye and grass seed should be sown as early as possible. At least two bushels of spring rye should be sown, as it does not tiller or spread at the root like fall rye.

Nova Scotia Plaster.—“J. C.,” Pittston, Pa. Nova Scotia plaster is regularly imported into New York, where just now it is quoted in the market reports at about \$4 per ton.

The Florida Agriculturist is the name of the first agricultural paper ever issued in Florida. It is a weekly of eight pages, published at Jacksonville by C. H. Walton & Co., and edited by S. D. Wilcox. Its first number is bright mechanically and editorially, and looks as if it would deserve the success we wish it.

A Vapor Stove has been advertised, and several have written to ask us if it is a humbug. It is not a humbug in so far as it is just what it pretends to be, a stove in which the heating material is the vapor of naphtha. We would not advise any one to use naphtha as a heating or illuminating material, as it is not a safe thing to have in the house.

Woolen Mill Refuse.—“H. P.,” Hawthorne, N. J. The refuse from woolen mills is rich in nitrogen, and is a valuable fertilizer. As it is free from water, it is more valuable on that account. It generally sells for \$10 a ton or thereabouts.

Agricultural Department Seeds.—“E. R. S.,” Greenbrier Co., W. Va. The seeds distributed by the agricultural department are said to contain pestiferous weeds and insects—at least it is so charged by many Western people who have been gratuitously favored with them.

Boat Building.—“H. W. H.,” Hillsboro, Ill. Full directions with engravings for building boats and skiffs were given in the *Agriculturist* of August, 1871, and October, 1872. These numbers can be procured for 15 cents each.

Liberal Potato Premiums.—Messrs. B. K. Bliss & Sons, encouraged by the great interest excited by the potato premiums offered by them last year, offer this year the handsome amount of \$1,500 in equal sums for Brownell's Beauty, Early Vermont, and Compton's Surprise. Six prizes from \$100 to \$10 are offered for the greatest yield from one pound of seed of each kind, and similar sums for the largest quantity grown upon a quarter of an acre of ground. Some growers who obtained large results last year failed to receive a prize for the reason that they did not comply with all the conditions of the offer. Those intending to compete should send to Messrs. Bliss for a copy of the schedule for 1874.

Do Not Fail to Read It.—The Premium List on page 73 of this paper is worthy of the attention of everybody who would like to *do good* and at the same time *make money*. Thousands of persons in years past, not only in all parts of this country, but also in British America and in other parts of the world, have each obtained one or more of these valuable premium articles by simply collecting a list of subscribers and forwarding them, with their subscriptions, to the publishers. Do not fail to read the Premium List.

Italian Rye Grass.—"J. S. W.," Los Angeles, Cal. The seed of Italian rye grass may be procured of any of the principal seedsmen in New York. The price is about \$1 per bushel. No other grass does so well for irrigated pastures or may be cut so many times in one season.

Sheep in South Carolina.—"G. H. McM.," Winnsboro, S. C., says: In January, 1866, a planter of Fairfield county bought thirty-eight sheep which he turned into his pasture, and soon after bought a Bakewell ram, and afterward a Merino and then a South-down ram. This was the total of his purchases. He now (November, 1873), has 350 sheep worth \$1,000. His wool has netted him \$900, and his mutton has netted \$875, besides what his family consumed, and mutton has been their only meat during summer and fall of every year. No care was taken of the sheep except to salt them and to give them a little cotton seed in the winter. The manure, with very little effort to save it, has enriched thirty acres of land so that it now averages 1,000 pounds seed cotton per acre instead of 200 pounds previously. The sheep have a little more than doubled in number each year except this year. This exception is caused by the fact that 100 of the flock strayed off last December, and when found late in January they had lost all their lambs but 16. The experience of this gentleman proves that sheep would be very profitable in the South with careful management. The profit would arise not alone from the mutton and wool, but in supplanting commercial fertilizers on all lands lying at a distance from railroads.

Three-Horse Clevis.—"Z. H. M.," Richmond, Ind. It is impossible for us to say why manufacturers of implements do not advertise their wares. There is a three-horse clevis made which was figured in the *Agriculturist* some years ago, but which is patented; we do not know the manufacturers' address. Seeing the demand for such a clevis it would seem a judicious thing in the manufacturers to make their address known.

Horses Hanging Back.—"B. C." It depends altogether upon the shape of the double tree whether the horse which hangs back does the same work as the one ahead, or more work or less. It may very easily be that he does more work instead of less. The proper method is to keep the horses even in the traces and then both work alike. Bad driving or bad matching is usually the cause of the horse hanging back.

A New Spinning-Wheel.—"W. W.," Bellville, Mich. We can not say anything about the "Briec" spinning-wheel, not being acquainted with it. The spinning-wheel is not at all out of date; it is one of those aids to a domestic manufacture which may very profitably find a place in the farmer's home along with the knitting machine or the sewing machine, and furnish useful employment to his daughters, who ought not to be above adopting the industries which used to occupy their mothers and grandmothers. Every article of domestic use that can be made at home saves so much expenditure of money.

Value of Chips and Bark.—"G. S. N.," Moon, Pa. The chips and bark which accumulate around a saw-mill if partly rotted are valuable when plowed into the soil. We have found such matter a nuisance when spread upon grass land, but when spread thickly upon an orchard in which a crop of potatoes was planted, the potatoes were thickest and largest where there were the most chips. For use upon grass land we would spread the stuff out to dry partly and then rake it into heaps and burn it to ashes, spreading them upon the surface. In this way it would be very valuable, and if from hard wood would pay to haul it.

Harrowing Wheat.—"E. B.," Washington Co., Pa. It would not be always safe to harrow wheat amongst which timothy seed has been sown. Clover seed may be sown after the snow has disappeared and when the ground is full of small cracks made by a light frost. The seed will fall into these cracks, and as the soil thaws it will be covered up lightly.

Temperature for Setting Milk.—"A Subscriber," Decatur, Nebraska. Although the temperature of a spring may be 50° yet it may be so managed that the temperature of the milk set in it may be kept at about 60°. This is the best temperature for raising the cream as well as for keeping it. The supply of water should be so regulated as to keep the milk at 60°. At 50° the cream will rise more slowly than at the higher temperature, and the butter will neither be so good in flavor nor color. A good plan of regulating the supply of water would be to bring it in a small pipe into the reservoir, through which it passes in a gentle current, keeping the temperature about 60° to 62°.

Steaming Feed.—"A. S. T.," Howard Center, Pa. There is no better steam chest known to us than that figured in the *Agriculturist* of January, 1873. The best boiler is either a "steamer," of which there are several very useful kinds, or an engine boiler. A sheet-iron bottomed plank steamer is not safe or economical in space or fuel. It is better to build the steam room at a distance of at least 100 feet from the barn, and carry the steam in a cast iron pipe or boxed wooden logs made very tight at the joints. A wooden trough can not be made tight enough for economy. For pigs the method of cooking described in the *Agriculturist* of January, 1874, is the cheapest and easiest.

Roofing Material.—"J. E. B.," Graniteville, Ill. Where pine shingles can be procured for \$4 per M. they are certainly the best and cheapest roof possible excepting perhaps slates. Other roofing materials are intended as substitutes for shingles or for roofs of low pitch, in which cases they become the best material.

Book by Prof. Winchell.—"Anna L. J." The work you probably refer to is Winchell's "Sketches of Creation," price \$2.

Caring for Sheep on Shares.—"A. S. T.," Howard County, Pa. For a hilly, exposed country where the feed is good, our native sheep crossed with the Cotswold would produce a superior race, probably better than any other cross, the Cotswold being hardy and used to a hilly country. The usual terms for caring for a flock of sheep is half the net increase, losses being made up, and half the wool.

Grinding Bones.—"J. S.," Ithaca, N. Y. The grinding of bones requires very strong machinery and considerable power. The attrition consequent upon putting them inside of a revolving iron cylinder would certainly eventually reduce them to powder, but the process would be exceedingly slow and costly, and practically impossible. A good bone-mill is the only profitable method of reducing them to powder or fragments.

Three Things for Congress to do.—If the members of congress are wise they will see the cloud that is now much larger than several men's hands, and shape their course accordingly. It is a safe prediction that in the next congress the agricultural portion of the country will be more largely represented than ever before, if indeed it be not the controlling element. If the present congress wishes to be in favor with the people we can suggest three minor things which will tend to that end. 1st. So amend or reenact, or somehow fix the present postal law so far as it relates to the sending of seeds, plants, and the like, that no "rulings" of the department or perversity of individual postmasters will practically deprive the people of the benefits of the law. 2d. To abolish the duties on all plants and trees and arrange for their rapid passage through the custom-house. As matters now are three fourths of the plants are lost by the delays at the custom-house, and the present arrangement amounts to prohibition to all save dealers. For instance, the writer had sent him a box of mainly wild plants from England. The contents were appraised at \$70 in gold, when in fact they had no commercial value whatever, not a florist in the country would have given \$5 for the lot. Still they were appraised by some one who probably never before saw or heard of a single plant in the lot at \$70, and we were charged 20 per cent in gold on that sum. In another instance a friend in France sent us a box of canna roots which were delayed so long that every root died and yet the charges were \$11. We give these bits of personal experience as illustrations of matters concerning which we have frequent complaint. A friend in Illinois had cuttings sent him of all the willows in the royal gardens at Kew. These were given by the British government, and the introduction of some of them may be of great benefit to the country, especially to the West, yet our friend had to pay over \$20 for the privilege of getting them into the country. Our 3d item is the Department of Agriculture, which is in many respects a fraud and a nuisance. Some of the papers are for economizing by cutting it off altogether.

We do not agree with these. We insist that the department has not yet had a fair chance. In the first place needs a head, and in the second place ample funds for an intelligent head to carry out the most liberal plans without interference by congressmen in demanding places for friends or seeds for their constituents. If a fair trial of the department under these conditions is without beneficial results then it will be time to shut up shop. The congressmen who will start and push through these and other reforms having a direct bearing upon the agricultural community will be wise.

Emigration to Kansas.—The statement to which a correspondent alludes, to the effect that "hundreds of emigrants were returning from along the line of the Atchison, Topeka and Santa Fe Railroad in the Arkansas valley of Kansas, disappointed with the country," was published in a Western paper as he states. In the next issue of that paper the statement was circumstantially denied, with an apologetic explanation. We are the more concerned with this matter because of the report made by one of the editors of the *Agriculturist* in which this district was favorably spoken of. Realizing at the time the responsibility attaching to such a report, made more for the interest of our readers and the public than for any other reason, it was made only after thorough personal examination and deliberate judgment. It would be well for those interested to procure a copy of the whole report, which they may do by applying to Mr. A. E. Touzalin, Topeka, Kansas, that they may have a clear idea of the whole matter and form their judgment accordingly. This would be the more judicious, as the report in a measure will apply to the whole of that part of the country lying immediately west of the Missouri river and north into Nebraska, upon the lines of the Burlington and Missouri and the Union Pacific Railroads. The only point of difference being that the Arkansas Valley possesses, in the judgment of the person who made the report referred to, some advantages which the other localities do not. This may, however, be a matter of taste with some persons, who would choose a more northern locality, equally fertile, in the State of Nebraska, and where general farming may be carried on with equal comfort and success. As a strong corroboration of the truthfulness of the report we may state that the entries of United States land the past season in the Wichita and Salina United States land offices (the Arkansas Valley district) have amounted to 500,000 acres, and that the Atchison, Topeka and Santa Fe Railroad have sold during the same period, and since May, 1873, the following quantities of land, viz.: in June \$273 acres, in July 9,638 acres, in August 12,547 acres, in September 19,163 acres, and in October 23,676 acres, at an average price of \$5 to \$6 per acre. This does not look as though there were many disappointed persons taking a back track. On the contrary, we have letters from parties who have settled there expressing themselves well satisfied with their present success and future prospects, and with the abundant fertility and great healthfulness of the country.

Other "Basket" Items will be found on page 75.

Going West.—"D. M. C.," Independence, Iowa. It is useless to blind one's eyes to the fact that a vast emigration is going westward. At the same time every westward-bound man leaves a successor in his place in the east. It is the natural expansion which has ever been at work in this country since the first emigrants landed. It is impossible to stop it; it is the wisest course to direct rather than to stem the current. A dozen years or so ago your own state was peopled in exactly the same way. Now Kansas, Nebraska, Minnesota, Colorado, and other states are filling up. To tell an American farmer to stay where he is or his boys to remain with the old folks is to tell them to do something they will not do, and it is labor lost. There are a few who go to see and return more contented with their old homes, but they are a very small minority. The railroads are the effect, not the cause of this western emigration, and the new settlers are by far more greatly benefited by the roads at present than the roads by the settlers. At first there are hardships and disappointments for both, but by and by as in Iowa and Illinois, both become profitably established.

Books Noticed.

STAR PAPERS, by Henry Ward Beecher: J. B. Ford & Co., New York.—This, like several other volumes in this list, has been on hand for some time waiting until we could find space to notice it. Fortunately it is one of those books that do not lose their freshness. Most of the articles were written twenty years ago, and they will be just as bright twenty years to come. This volume

contains some of the best of Mr. Beecher's miscellaneous writings, and in saying this we give it sufficient commendation.

HOW TO PAINT, by F. B. Gardiner: S. R. Wells, New York.—Almost any one of ordinary "gumption" can learn to paint sufficiently well to do ordinary jobs about the house and premises. To those who wish to do their own painting this little work gives hints about mixing and applying colors that will essentially aid the novice. Price, 75 cents.

ELEMENTS OF ANIMAL PHYSIOLOGY, by John Angell; a reprint of an English work by G. P. Putnam's Sons.—This seems to be a very compact and comprehensive little work, giving much useful information, and well illustrated. Messrs. Putnam are to be congratulated upon the generally excellent character of their elementary science series, of which this work is a part.

HANDBOOK OF THE TREATMENT OF THE HORSE, by Charles Wharton: J. B. Lippincott & Co., Philadelphia. Most works upon the horse and its management are too bulky and cumbersome. This neat little work of 137 pages contains about all that a person who keeps but one or two horses needs to know. Besides the portion which relates to general care and management, it gives an account of such ailments as can be safely treated without the advice of a veterinary surgeon. Price, \$1.25.

HANDBOOK OF HARDY TREES, SHRUBS, AND HERBACEOUS PLANTS, by W. B. Hemsley: Estes & Lauriat, Boston.—This work is based upon the excellent work, *L'Amateur des Jardins*, in 4 vols., by Decaime & Naudin, although it can hardly be called a translation of it, as the arrangement is different, and it includes only the hardy plants. This work, however, presents the same elegant illustrations as the original. From our knowledge of the French work we are safe in commending this to those who wish to know something of the botanical relationships of the plants they cultivate. As far as we have examined it, the work appears to be well done and the descriptions remarkably free from technicalities. Price \$7.50.

DOMESTICATED TROUT. How to Breed and Grow them, by Livingston Stone: James R. Osgood & Co., Boston.—This is not a very recent work, but it has been overlooked until now. Mr. Stone is a high authority in pisciculture, and has done much towards introducing fish into our waters. This work contains a very full account of the art and mystery of trout raising, and is produced in the excellent style characteristic of the house by which it is issued. Price \$2.50.

CHIMNEYS, FURNACES, FIREPLACES, and Steam Boilers, and Steam Boiler Explosions are Nos. 1 and 2 of the neat science manuals issued by D. Van Nostrand, New York. No. 1 is by R. Armstrong, and No. 2 by Zerah Colburn. They are small handbooks of 75 to 100 pages each, and must be very useful to all who have to do with furnaces and steam. Price 50 cents.

RATIONAL HORSE-SHOEING.—This little work is descriptive and explanatory of the method of shoeing horses with the Goodenough shoe. It is a book that should be read by every horse owner, because it teaches a rational system of treatment of the horse's foot, by following which the greater part of the troubles which affect the foot of the horse may be avoided. Unfortunately, few owners of horses are sufficiently educated in this respect to enable them to resist successfully the ignorant and injurious methods of shoeing practiced by blacksmiths, by which the hoof is hurned and its most important and necessary parts are cut and hacked away. The system taught in this book is in operation in most of the largest horse-car stables in New York and Brooklyn, as well as in those of the owners of some of the most valuable high-bred horses. This fact is alone a remarkable indorsement of this practice of treating the hoof of the horse.

Catalogues Received.

LANDRETH'S RURAL REGISTER and Almanac for 1874.—This contains, besides an almanac and useful calendar of operations for each month, a catalogue of the seeds raised and sold by the old and reliable house of David Landreth & Son, Philadelphia.

HIGHTSTOWN NURSERY.—Thomas J. Pullen succeeds his father, Isaac Pullen, at one of the oldest nurseries in the country, at Hightstown, N. J. This nursery makes a specialty of peaches.

THE FLOWER GARDEN.—Beach, Son & Co., 76 Fulton street, New York, publish their seed and bulb catalogue in the form of a quarterly journal. The portion devoted to horticultural matters is ably managed.

B. K. BLISS & SONS publish a tender to their enormous illustrated catalogue in the form of an "Abridged Catalogue and Gardener's Almanac." This contains all the

novelties of the season and the leading articles in the larger catalogue in a compact form.

BRYANT'S NURSERY.—The catalogue offers a good assortment of fruits and an especially full list of evergreen and deciduous ornamental trees. Another list contains a large variety of tree seeds, especially those of native kinds.

CHARLES A. REESE's catalogue of plants and seeds presents an attractive list of the standard varieties. His place is at Pleasantville, Venango Co., Pa.

HENRY A. DREER, Philadelphia, catalogue for 1874, contains the usual standard flower and vegetable seeds with several novelties and specialties.

The following European catalogues have recently come to hand:

A. CHAROZE, trees and greenhouse plants, Trclazé, near Angers, France.

J. MONNIER & Co., seeds, Trclazé, France.

CH. HUBER & Co., Hyères.—This is one of the largest seed-growing houses in France, and their catalogue of both vegetable and flower seeds is very full. They also offer fine greenhouse plants.

J. C. SCHMIDT, Erfurt, Germany, seeds, plants, and trees. Bouquets and ornaments of dried flowers are a specialty with this establishment, and their illustrated catalogue shows to what a wonderful extent this trade is carried on.

LOUIS VAN HOUTTE, Ghent, Belgium.—Probably no horticultural establishment in the world is better known than Van Houtte's. The present catalogue is mainly devoted to Alpine and herbaceous plants.

JAMES BLACKLEY, Leyton, London, Eng., has a catalogue entirely devoted to new varieties of carnations, with the varieties handsomely illustrated.

BENJAMIN REID & Co., Aberdeen, Scotland.—Catalogue of timber trees, conifers, and shrubs.

Bee Notes.—Advice to Beginners.

BY M. QUINBY.

It was probably colder during the month of November, 1873, than ever before in this latitude so early in the season. The coldest morning was two degrees below zero. December was very mild. The snow of November is about gone, and the mercury has been down to nine degrees once or twice only. Had I known that the weather would be as it has been, and that it would continue so throughout the winter, I should not have advised housing bees, even in this latitude. The pleasant sunny days have been frequent, and all-sufficient for their health. Those who have been negligent or heedless, and left them in the open air, if January proves mild, may let them remain. Look to them often. See that dead bees do not fall down and choke up the entrance. With a bent wire all can be cleaned out at any time; or, if warm enough to melt snow and ice, raise the hive occasionally and sweep out all clean. If mice have been at work small crumbs of comb will be scattered on the bottom board, which will suggest a trap at once. Do not mistake the brown particles like pin heads, perhaps smaller, that will be seen on the bottom board, for crumbs of comb. These particles after cool weather commences, may always be seen, and are worth observing closely. The quantity indicates the size of a colony, better even than a sight of the bees. If no mice scatter it, it may be seen directly under the spaces between the combs in little ridges sometimes a half inch in depth. If the cluster is strong and the time of confinement has been long there will be a large quantity. You may tell the exact number of combs that contain bees between them, and how far they extend each way, by the length and size of the ridges. In purchasing stocks in winter observe this first, and any hive not showing streaks of this substance under more than one or two combs you may be satisfied has but few bees without looking to see them. It is not profitable to buy such for stocks at any price. When bees are in health it is apparently dry, and but few dead bees are mixed with it. Until very recently I had supposed it was simply the fine particles of wax that had covered the sealed honey in the cells, and bitten to pieces by the bees in getting at the honey. Having observed it in some colonies where there was no sealed honey, or but very little, it gave rise to the idea of its being excrement in a dry state. When bees are filled with honey, and become chilled, if only for a short time, they do not seem to digest their food properly, and their excrement is discharged in liquid state—a sort of dysentery—in or outside the hive. Bees have been confined in comfortable quarters for seven consecutive months without discharging any faeces unless in a dry state. These facts suggested the idea that this substance, or a portion of it, may be the excrement of bees in a healthy state. Whether it proves to be mixed with excrement or otherwise, it will give a criterion to judge of the health and

size of colony. Whenever the excrement is discharged inside in a liquid state it indicates that it has been too cold. The remedy is to make them a little warmer. Analysis of this dust may give us further light on other points.

Those who have taken the precaution to house their bees need have no uneasiness about them, as very likely they will require less care than otherwise. If severe cold has been anticipated, and arrangements to protect them against it have been made, there may be a little danger of their being kept too warm. A thermometer costs but little; the satisfaction of knowing instead of guessing how cold it is is great. Hang one in the room with the bees, and if the temperature is nearly steady, and does not go above 50° Fahrenheit, they may be left quiet, and if the least ray of light is not admitted they will not be likely to waste. I know of a lot of bees that were put in a dark, dry, warm cellar on November 10th. Have now been in fifty days. The temperature has varied only from 47° to 49° during the time, and bees never seemed more comfortable and quiet. Should the warmth at any time go much above 50°, I would recommend introducing into the room a quantity of snow or ice, to cool it properly, rather than set them out before the proper time.

Profit from Hot-Beds.

J. B. ROOT, ROCKFORD, ILL.

There is scarcely a town of 5,000 or even 3,000 inhabitants, but where the gardener or florist can make an important and very profitable addition to his business by growing and selling hot-bed plants for the garden. Two causes have operated to prevent a full development of this branch of business in our smaller cities and towns.

First, while florists and gardeners in our large cities have abundant capital, their brethren in smaller towns, and especially in the West, either have but small means, or else have other urgent demands for them; so they are unable to make the required investment in glass and fixtures. Secondly, the plants usually produced are not sufficiently stocky and well hardened to attain extensive sale.

In showing how these difficulties can be obviated I shall not state merely what *can be done*, but shall confine myself strictly to what *has been done* in my own experience during the five years past. Glass sashes 3 × 5½ feet ready for use usually cost \$1 each, making \$16 for a bed of four sashes. The interest upon this is \$1.60, and the wear and tear as much more, making an annual expense of \$3.20 per bed, and demanding an investment of \$400 for glass in carrying on twenty-five beds. Believing this to be an unnecessary expense, five years ago I began using prepared sheeting, and with such satisfaction that it now constitutes four fifths of my covers. To render the sheeting more transparent and at the same time make it air-tight, use the following preparation: 1 quart linseed oil, 1 ounce pulverized sugar of lead, 4 ounces pulverized rosin; heat in an iron kettle till all is thoroughly dissolved and mixed. Apply while hot with a brush to the muslin while stretched over a frame. Endeavor to apply when two successive clear days can be had to dry it well before placing it over the vapor and heat of a bed.

Before applying this two widths of muslin are stitched together of such length as to make them a few inches longer than a four sash bed. The edges are hemmed (also on the machine) and small brass rings sewed on firmly at fifteen inches apart around the whole border. By hooking these over small nails or inverted hooks the cover is stretched nearly air-tight. When it is desired to open the beds they can be unhooked and rolled down as far as desired and fastened, or rolled entirely off upon a clean

board at the foot of the bed. Ready for use these cost in money \$1.25, and in labor enough to make the entire cost nearly equal the interest on glass for one year. In careful hands they will probably last three seasons. My own last two seasons and are used for weeks together in the field for gathering turpentine, lettuce, and other dry seeds, and in the fall in drying cucumber, tomato, and similar pulpy seeds.

For use on the earliest beds in the short days of February, I prefer glass because it gathers heat quicker during the few hours of sunshine. If a week of cold, cloudy weather occurs in April, of course cloth covers have their disadvantages, but I have never suffered an actual loss from them, while annually with such help as we are compelled to hire I lose something from the glass beds, and taken altogether I prefer cloth for most uses after the 10th of March. They do not gather heat so rapidly during the day as glass does, and hence there is less danger of burning or drawing plants, nor do they throw off heat so fast at night, and hence need less covering. Fitting tight to the frames they admit of no draughts, undergo no sudden changes, and suffer little from dampening off. They are safer than glass in inexperienced hands, and are handled and stored at less expense.

Plants grown under such covers I am annually selling in large amounts and shipping to other points where they are brought in competition with plants grown entirely under glass, and I have never heard anything to their disparagement. They are of course equally as serviceable in the private garden as for commercial purposes. [Our space will not allow us to give Mr. Root's method with tomato plants; we can only state here that he sows the seed late in February in shallow boxes placed in a strong hot-bed, and to guard against accidents repeats the sowing every week or ten days. The details of his after treatment will be given next month.—Ed.]

Watering Stock in Winter.

We wish our readers would make the following simple experiment. You have a trough or half barrel into which you pump water for stock. There is more or less ice in the water. Your cows and sheep are drinking it. Put a thermometer in this water and you will probably find that it is within a degree or two of the freezing point. Then pump up a pail of water, and if the pump has not been used for a few hours you will find (at least we did) that this water is also down to 33° or 34°. Now pump two or three more pails of water, or until you are sure you have drawn up all the water that has been standing in the pump and are now drawing it fresh from the well. Let the thermometer stand in this a few minutes and you will find that this water is not far from 50°—or say from 15° to 20° warmer than the first drawn water or than that standing in the trough. In the summer, nearly every farmer when he wants drinking water will pump out the water that has been standing in the pump because he knows that it is warmer than the water in the well. We should do the same thing for our stock in winter, because this first drawn water is much colder than the water in the well. It has been found very advantageous to artificially warm water for horses and cows. We can not all adopt such a plan, but we can take measures to give our animals water fresh and warm from the well. We can avoid compelling them to drink water in which ice has

begun floating for some hours. A cow drinks, or ought to drink, not less than 75 lbs. of water per day. This water has to be raised to the temperature of the body—say 100°. The heat required for this purpose is derived from the combustion of corn, hay, or other food. Those at the East think it a sad waste when they hear that Western farmers burn corn in their stoves to cook their food or warm their houses. Are they not more to blame for reducing all the water their animals drink from 50° down to 32°, and then burning corn-meal to restore these 18° of heat?

Agassiz.

Everywhere that papers are read is the death of Agassiz known, and those must be rare indeed who have not perused some account of his life and labors. Some of the illustrated journals have given portraits of the great naturalist, but they are so unlike Agassiz as we knew him before the illness of a few years ago caused him to suspend his labors for a long time, that but for the name below the pictures we could not guess for whom they were intended. Thinking that many of our readers would like to see a representation of him as he appeared in full vigor, we have had an engraving made of a photograph for which Agassiz sat at the request of the writer several years ago.

Although not an agriculturist, his portrait properly finds a place in an agricultural paper, as, many-sided man that he was, he had a more profound knowledge of the principles upon which its successful following depends than many who devote themselves especially to agriculture. As a member of the Massachusetts State Board of Agriculture he thoroughly identified himself with the farmers, and at its meetings, from which he was never absent unless ill or upon some distant journey, he was ever ready to impart instruction, and by his enthusiasm in regard to matters relating to agriculture awaken a like enthusiasm in his hearers. It is not necessary here to speak of the scientific eminence of Agassiz nor of the great works upon which it rests, as these have been so recently recounted as to be fresh in the minds of all readers. Aside from the great popular respect in which he was held for his scientific labors, he was regarded by the people at large with a feeling of warm personal regard. Upon the lecture platform he had a singularly attractive manner; he made his subjects so plain, and adapted himself to the commonest comprehension without appearance of "talking down" to his hearers. Indeed he would speak of things that were as familiar to him as the alphabet with such enthusiasm that one would suppose they were the discoveries of the moment and he was for the first time making them known.

His popularity as a public lecturer was unparalleled, but he found that lecturing interfered too much with his scientific work, and in later years seldom appeared outside of his own lecture-room or the public meetings of the Massachusetts Board of Agriculture. Personally, Agassiz was one of the most accessible and genial of men, making friends wherever he went and with all classes. Even the fishermen, who are not given to admiring those outside of their own craft, had a word of praise for Agassiz. A little personal incident may not be out of place, as showing something of the unassuming character of the man. Soon after Agassiz came to the country, the writer

was with him at a large party given in his honor in a New England town in which he was giving some lectures. At the party Agassiz was as "beaming" and as interesting as one could be. We noticed that at the refreshment-table he was very abstemious; and soon after this part of the entertainment was over, he intimated to us a desire to leave, and we quietly departed. No sooner had we fairly left the house than he began to hop, skip, and jump in a most astonishing manner. "There, that is over," he said; "now let us go and enjoy ourselves." Oysters were suggested, and, though it was rather late, we found a place still open where we were soon seated over our oysters. Having been brought up in a place celebrated for its oysters, we supposed we knew something about them; but Agassiz soon convinced us that we had much to learn. The talk of that night will not be forgotten. He ran on in his own charming manner with the whole history of the oyster, from the "spat" to its full growth, the difference of oysters in other countries, the manner of their economical cultivation, the various parasites and enemies of the oyster and much more besides. Finding that the watch showed after one o'clock, we rose to retire, and found that the oysterman and his assistants were all standing around at a respectful distance, with eyes and mouth wide open, quite willing to be kept up to this unusual hour while this wonderful man discoursed. Agassiz's memory was something remarkable, not only for scientific facts but for common names. He once said to the writer, upon expressing surprise that he should remember the names of persons whom he had seen but once, "I never forget a name when I once know it."

However important his published works, the great museum which he founded, and the Anderson School of Natural History, the great and lasting influence of Agassiz will be found in the impulse he has given to the study of natural history in this country. When he first came among us naturalists were very few, only here and there one working by himself; now they are numerous and to be found in every state and territory. Falling in his 67th year, in the midst of his usefulness, his name will be honored in all civilized countries. We could not do less than give this humble tribute of respect to his memory.

Ogden Farm Papers.—No. 48.

Coming home again, after three months' absence, I found things "as well as could be expected under the circumstances," but circumstances had not been favorable. The well from which the windmill forces water to the barn and to the dairy, and which has never failed before, though sometimes nearly dry, had this season to be sunk eight feet deeper, and went dry after all. The house well went so nearly dry as to give a very scant supply for the milk pool, and the brooks disappeared from the face of the earth—everything went dry except one stream more than two miles away. From this all the water used on the farm had to be hauled for weeks, and the vat in which the deep milk-cans are set, not having the fresh spring water for which it was intended, had to be kept cool by the constant use of ice. Pastures were pinched down to the shortest bite, and the corn fodder on which we usually depend for almost the entire feed of the latter part of the season, and for an abun-

dance of winter forage, was nearly all of it dwarfed, the early season being too cold for strong growth, and the dry weather cutting short all that was not well started—so that the store left for winter use was almost nothing. In short, the drouth had evidently been much the most severe we have ever had, and any farmer will know what that means.

At the same time, I had decided that I should buy no more hay—that part of the improvement of the farm is, I am glad to say, finished, and the land is now able to make a good stock of manure for itself—and the crop of the year had been good enough to allow me to stick to the decision. My Illinois herd would take away about twenty-five head of Jerseys, and I could make good arrangements for the winter for all the calves, dry cows, and colts on a farm near by where I have plenty of hay. So we went into winter quarters with only eighteen head of horned cattle and the working mules. With this small stock, and with the hay all of the best quality and early cut, the steaming apparatus is laid by for this season, and we are pulling through the winter very comfortably after all.

I am not insensible to the pleasure and advantage of writing this series of papers; but I sometimes feel the annoyance of it, and wish that less publicity need be given to my farming. Of course, visitors are always welcome, and it is to be expected that those of them who write for the papers will print the result of their observations. It would be sometimes pleasanter if they did not. One well-disposed writer from Pennsylvania came in the very height of the drouth. He spoke no German, and my people speak little English. He went away and wrote his impressions—and evidently with a disposition to say as much for Ogden Farm and as little against it as he possibly could. Yet this is the impression he gives:

The Jerseys are all right; when compared with many in Pennsylvania the farm suffers by comparison (of course it does, most of the farms of this country do); one field was said to have cut four tons per acre, he would have guessed one ton (it cut four tons in 1872 in the whole season, in 1873 not much over two and a half, owing to the drouth); the drains were not running, the windmill well was dry, we have to drive miles to water, and would find the salt sea nearer; underdraining seems not to prevent drouth; we were, in spite of all this, making an average of 6½ lbs. of butter per week from each cow (not true, for we are buying considerable of milk in addition to our own); the cows average 10 quarts a day (at that season it was not over 7); to make a pound of butter requires over 10½ quarts of milk (of our own milk at that season it took 7 to 8 qts.); the pool for the deep cans is supplied from a spring at the bottom of a well, 75 feet deep, close by, and the water is drawn and put into it by hand, which takes a man six hours a day (this is only during a rare drouth like this, and even then only a few buckets of water are put in each day to keep up the quantity, and ice is used to keep it cool and fresh); the pool does not contain running water, as we supposed, "but is simply an open cistern" (it is supplied with fresh water by every wind that blows, except in times of such drouth); and so on, pretty nearly to the end of the chapter. The report is friendly and on the whole complimentary, but the real facts of the case at Ogden Farm are about as incorrectly stated as they

could have been by an intelligent man with every desire and disposition to state them correctly. I can only hope that my ignorance of Dutch and Wouter Sluis's imperfect English did not so much interfere with my impressions of the Bermster in Holland.

Recently, in feeding our cows, we came upon a part of the mow where we had put away several tons of clover from a newly-seeded meadow. We have now fed this exclusively for two weeks, and although the hay fed before it was very good (mostly red-top) the milk of the whole herd has increased *fully sixteen per cent.* Comment is unnecessary.

Gen. Tilton, the director of the National Soldier's Home near Augusta, Maine, has recently published some statistics of the dairy of that institution which are instructive. He has since sent me the weights of the animals in question, and the whole statement of the case is as follows:

MILK FOR THE YEAR ENDING OCT. 23, 1873.

Breed.	Number.	Weight of each animal, Dec. 17, 1873.	Age.	Period of weighing, in days.	Number of days in milk.	Whole product in pounds.	Average per day during the whole period.	Average per day while in milk.	Per cent of cream in milk.

Breed.	Aver. days in milk.	Average of whole product in lbs.	Average per day in pounds.	Av. per day while in milk, in pounds.	Average loss by being dry, per cent.	Average quarts per year of 2.15 pounds per quart.	Per cent of cream.	Average cream, per year, in quarts.
Holsteins.....	325	6930	19.00	21.83	12.50	3241	12.50	405
Grades.....	298	4425	12.11	15.93	24.00	2062	13.33	275
Jerseys.....	322	3901	11.60	13.32	13.66	1814	21.67	393

Discarding fractions, the average weight of the three classes was: Holsteins, 1,225 lbs.; Grades (natives?), 1,067 lbs.; Jerseys, 901 lbs.

"The grades," says Gen. Tilton, "are the best of their class, having been selected with special view to their milking qualities. The cows were in no case overfed. They have had little or no feed except hay in winter, while in summer they have had poor pasture, supplemented with green-corn fodder at night."

The proportion of milk (average per day for the whole year) as compared with the average weight of the cows of each class was:

Holsteins, 1 ⁶⁶ / ₁₀₀	per cent of live weight.
Grades, 11 ⁴ / ₁₀₀	" " " " "
Jerseys, 12 ⁸ / ₁₀₀	" " " " "

The proportion of cream may be best stated as follows:

- Of Holsteins, it took 3⁷/₁₀₀ lbs. live weight to produce one quart.
- Of Grades, it took 3⁵⁵/₁₀₀ lbs. live weight to produce one quart.
- Of Jerseys, it took 2²⁰/₁₀₀ lbs. live weight to produce one quart.

The foregoing tables and calculations may be with advantage considered in several different lights, but there is one that is especially important to butter makers:

If an animal (other things being equal) consumes food in proportion to its weight, then, in order to make as much cream from the other breeds as can be made by a Jersey consuming 2,000 lbs. of hay, we must feed a Holstein 2,649 lbs., or a Grade (of the kind and quality used by Gen. Tilton) 3,402 lbs. Of course, the surplus would not be all wasted, the Holstein would make more skimmed milk (containing caseine), and the Grade would probably gain flesh, while the Jersey would keep thin. Still, when butter is the object, and no equally profitable use can be made of skimmed milk or flesh, the profit lies heavily on the side of the Jersey. I believe that a quart of Jersey cream will make more butter than a quart of cream from either of the other breeds, but this is only a matter of opinion, not of positive knowledge.

Whether cows do consume food proportioned to their live weight is a question which it is to be desired that some one would settle by careful experiment. Probably a thin animal would eat more in proportion than a fat one, but the weights and ages of Gen. Tilton's Jerseys show that they were not thin. When I saw his herd, two years ago, they were in excellent condition of flesh.

Mr. H. B. Gunler, of De Kalb, Illinois, has asked for an opinion on this question. He puts it thus: "If one of two cows of equal weight will produce 25 to 30 per cent more butter (or milk of the same quality) must she not require more food, or are her digestive organs enough better to make that difference? I should think that after allowing an equal amount for the support of each cow's system they must require food in proportion to milk or butter produced unless one has more of a tendency to put on fat than the other."

This question covers a good deal of ground, and I have found nothing in my reading that enables me to answer it very definitely, nor have I ever been so situated as to experiment with sufficient care and to sufficient extent to decide it. At the same time, one would think that a matter of such vital importance should have been elucidated before this time. Gen. Tilton's experiment throws much light on it, but does not go far enough. The experiment should be made with animals of about the same age, of the same breed, in the same condition as to pregnancy, and in the same state of health. They should be weighed every day, and note should be made of their daily condition; their milk should be weighed at each milking, the milk of each should be creamed separately, and the amount of butter the cream of each makes should be noted; the food of each should be carefully weighed; it would add to the value of the experiment if the cows were divided into two or more lots and fed differently (alternating the food of different lots from time to time); and, still further, if special additions of grain, etc., be made to the food.

In the absence of such definite experiments it is impossible to answer Mr. Gunler's question with precision. The opinion I should give would be an opinion only, but it would be that the better producer of the two cows would not only eat more food, but would also convert more of what she did eat into the products of the udder. If they consumed like quantities

of food one would doubtless take on more fat than the other, and more of her food might pass in the manure. There can in no case be a loss of the elements of the food. It will form either milk, flesh, or manure. A close observation on the part of the farmer will enable him to judge with much accuracy which animal converts the most of her food into one product and which into the other; but there can be no certainty short of actual weight and measure in a carefully conducted trial. Certain breeds have special tendencies. The Shorthorns for butchers' meat; the Dutch cattle (erroneously called Holsteins) for milk; and the Jerseys and Guernseys for butter. In each class there will be individual tendencies to a greater or less concentration of the nutriment in the product for which the race is distinguished, but so much of it as does not go to this must go to one of the others—or to the manure heap, which is a waste as compared with the product for which we seek.

I have a letter from a former correspondent who complains of too rough handling in the Ogden Farm Paper for October. He says he did not mean any disparagement of foreigners, only that right-minded young Americans do not like to work under them, and that this is one of the reasons why they leave the business of farming; that there is a disposition in America to use foreign help and foreign wares simply because they are foreign, and that if gentlemen who go to farming would employ American foremen they might get American laborers. It seems to me that this would hardly do much to "keep young men on the farm," for the simple reason that they can generally do better than to work by the month. A young American who has in him the stuff for a good farm laborer usually has enough of another element to make him ambitious to be something better; he goes to another occupation, or takes a farm on shares, or manages (or tries) in some way to improve his condition. The greatest objection to him as a hand is that he don't *stick*. He works well while he works, but he is always longing to better himself, and that makes him unreliable. The same is still more the case with American foremen. If they are worth having they are out of place, and they soon find it out and get farms of their own. There are exceptions, of course, but this is the rule. It is not so easy for foreigners to get farms of their own, and this leaves a better class of them from which to choose foremen.

I think the main reason why we use so many foreign goods and employ so much foreign help is because at the same price we get a better article, and I know of no better reason that we could have. So much of my remarks as gave displeasure to my young friend were brought out by his misuse of the word "Americanism," and he says he did not mean by this what I supposed he did.

I have just made up my dairy woman's account. She gets a bonus of one cent per pound on all butter sold at \$1 per pound. This amounted from May 1st to December 31st, to \$34.88. In addition to this we sold several hundred pounds before the Newport season commenced for less than \$1.

Considering the drouth I think we may be satisfied.

J. H. Y. asks about crops for soiling. He intended to sow a patch of rye early in the fall for early spring feed, and another late in the

fall for late spring feed (one acre in all), and then to plant two acres of drilled corn for fodder; and wants to know how many cows he can keep from time of first feeding rye to end of corn feeding. The arrangement is not a good one. Probably the late and the early sown rye will shoot at the same time in the spring, the chief difference being that the early sown will make the heavier growth. Rye is only useful for a very early feed. As soon as it blooms it imparts a bad taste to butter, and the straw early gets too hard to be relished by cattle.

A better arrangement would be: $\frac{1}{2}$ acre early sown rye, $\frac{1}{2}$ acre early sown oats, 2 acres corn, planting at four different times from May 15th to July 1st in plots of $\frac{1}{2}$ acre each.

"The cattle having the range of six or eight acres of moderate pasture," the soiling crops should suffice for the supplementary food of from eight to twelve cows, according to how "moderate" the pasture is, and how good the land growing the soiling crops.

Stock Breeding.

THE IMPORTANCE OF GOOD BLOOD AND GOOD MANAGEMENT.

BY T. C. JONES, DELAWARE, OHIO.

If anything can be regarded as settled in the theory and practice of American agriculture it is that, except in the immediate vicinity of large towns and cities, and possibly on the rich cotton and sugar lands of the South, the business can not be made profitable without including the growing or feeding of stock; which is found to be indispensable to the maintenance of the fertility of the soil and the success of that mixed system of husbandry without which we have no protection against the disastrous effects of low prices and unfavorable seasons upon particular crops or products. The opinion, therefore, which so generally prevails, that stock-growing must be abandoned in the older States for the reason that their high-priced lands can not compete with the cheaper lands of the new States and Territories, is manifestly erroneous; because, whatever changes may be required in the practice of agriculture in the older sections, in view of the competition of the rich corn and grass lands which by a mistaken policy are being forced into occupancy in advance of the actual necessities of the people, it seems obvious that so long as the land is used for the production of crops the grazing and feeding of live stock can not be dispensed with.

This is demonstrated by the practice of the farmers of Great Britain, who, notwithstanding the high price of land and of all varieties of tillage crops, pay more attention to stock breeding than any other people in the world. The course of agriculture in our own country teaches the same lesson. I remember the time when the feeders of the Scioto Valley grazed their cattle on the prairies of Illinois; and predicted that in a few years this great State, with its matchless soil, would be able to raise cattle enough to break down prices so as to render the business unproductive in the older States, just as we now hear the prediction that Texas and the Territories will soon grow the beef for the whole United States. But what have been the actual facts? Illinois, though surpassing the most sanguine expectations as a corn and grass-producing State, had, according to the last census, less than one hundred and fifty

millions of dollars invested in live stock, while the old State of New York had nearly one hundred and seventy-six millions. The live stock of Missouri is reported as worth eighty-four millions, while that of the old Keystone State is set down at more than one hundred and fifteen millions, and Ohio at over 120 millions. Texas, with all its advantages as a grazing country, and an extent of territory equal to a half-a-dozen of the old States, has only 37 millions in live stock, while Michigan has nearly 50 millions.

It is also to be observed that while the Western States, excepting Texas, are rapidly increasing in live stock, as in all other products of agriculture, the older States are also making very respectable progress. Thus, while Illinois between 1860 and 1870 added 77 millions to the value of her live stock, New York during the same period added 73 millions. The increase in Pennsylvania was 46 millions, while in Missouri it was only 31 millions.

These facts are quite significant as indicating the prominence which this great interest has, and must continue to maintain, in American agriculture. It is therefore safe to assume that in the future, as in the past, the prosperous farmer will be the man who handles most judiciously his live stock; for it is unquestionably true that while this branch of industry is, when properly managed, the most profitable, as it is the most interesting, connected with our vocation, it is the most disastrously unprofitable when the management is bad.

For example, a man who allows his growing stock, say cattle, pigs, or sheep, to run down during winter, so that, instead of gaining, they lose in weight, will lose his entire winter's keep, because his animals are worth less in the spring than they were the previous fall. And so the man who buys a lot of badly formed scrub cattle, because they cost less than good ones, will lose a heavy percentage, because they will not "lay on" flesh as well-bred cattle would on the same feed; and when brought to market they will have to be sold for at least 25 per cent less per 100 lbs. on account of their inferior quality and weight.

If for breeding or milch cows inferior animals and inferior blood are procured, the result will be still more disastrous. If we select a good cow that will give a fair quantity of good milk, and of such form and blood that her calves will be worth raising, and that can be converted into a good carcass of beef when no longer wanted for breeding or for milk, we shall have made the most profitable investment that pertains to legitimate agriculture; while a cow with qualities the reverse of all these will be the most unprofitable thing that could be selected. The same observations will apply to stock breeding in all its branches. "Blood will tell"—if you give it a chance—but an ill-bred and ill-formed animal will usually "eat his head off" under the best management.

It was in view of this undeniable fact that the great Bakewell insisted that everything depended on *blood*. You must have a good *sort*, and having this reserve only the best for breeding. Insist upon "the survival of the fittest" only for breeding purposes, and thus if you feed well, so that your young stock is always kept in a thriving condition, you will maintain the excellence of your stock and insure satisfactory profits from a branch of industry that is as interesting to men of the highest culture and refinement as it is essential to the daily wants of the world.

Morgan Abdallah.

The engraving represents a four-year-old colt, Morgan Abdallah, the property of the Rev. W. H. H. Murray, whose farm is at Guilford, Ct. We had an opportunity of examining this promising young horse with one of his colts at the New England Agricultural Fair at Boston a few months ago, and were much pleased with him. He is a very handsome and beautifully formed animal, of a rich dappled bay color with black points. His disposition is remarkably gentle, and his training or rather his management up to the present time has been judicious and successful in making him perfectly docile, although he is not in the least wanting in spirit. He possesses a large share of Morgan blood, being descended from Justin Morgan on the side of both sire and dam. He has also the blood of Old Abdallah, through his grand-dam on his sire's side, who was by that renowned

horse. He has trotted a quarter of a mile in 43 seconds, although he has been harnessed but twenty times, and has never been shod. But while we do not undervalue in the least the attribute of speed in a horse, we look upon this as well as all other worthy representatives of the Morgan race as being in an especial degree the farmers' horse—the general utility horse in fact. Docile yet active and spirited in temperament; hardy in constitution; stout and trustworthy in the draft; sagacious and ready to learn, and, possessed of a good memory, remembering what he has once learned; a good worker; a good traveler and easily kept; he is probably the best horse upon a farm that can be had, and will do as much work as many a larger horse, and at a less cost and in a more satisfactory manner. Without disparaging in the least any other of our valuable and worthy classes of horses, we feel justified

in giving at least this credit to the Morgans. Many farmers find it best for them to keep a moderate-sized horse adapted for use in the plow as well as in the buggy, and available for heavy draft upon the roads,

and in the Morgans he finds precisely the horse he needs. Those who desire heavy horses will seek the heavier breeds, which have greater weight but at the same time less speed and activity. But it is a question if heavy horses are the most economical upon farms

fleece, which reaches in good specimens a weight of eight or nine pounds of medium wool, produce a heavy carcass of good lean mutton, are hardy, and bear a change of climate and pasture well, and are more prolific of lambs than some of the others of this class of

MORGAN ABDALLAH—PROPERTY OF THE REV. W. H. H. MURRAY.

where the labor is of a varied character, and where activity is more desirable than weight.

Shropshire-Down Sheep.

A portrait from life is here given of a pair of Shropshire-Down sheep imported recently with a considerable flock by Mr. Joseph Hoyt of Suisun city, California. This class of sheep

IMPORTED SHROPSHIRE-DOWNS.

is cross-bred, but has been bred so carefully for the last twenty years that they may now justly be considered as an established breed. They have the good points of both the South-Downs and the Cotswolds combined, bear a heavy

their mark there in improving the native Californian sheep. For this reason it is to be hoped that Mr. Hoyt's enterprise in personally selecting his flock from amongst noted prize winners in England, at a large cost of time and money, may be rewarded by abundant success.

EARLY EGGS.—Fresh eggs in the winter are one of those luxuries that farmers may command more readily than any other people. A fresh egg at this season is a rarity upon a farmer's table. Yet they are easily to be had. For many years we have never been without them. A few early pullets well fed throughout the fall, or even at this season, early in the winter, will lay by the end of December, or sooner, if they have been well cared for. Our plan was to prepare especially for a dozen selected young hens or pullets a warm dry house; to feed

them some meat scraps, boiled potatoes given warm, warm parched corn, and scalded wheat also fed warm, with some pounded bones and a few peppers occasionally mixed in their feed. Warm milk or curdled buttermilk was also oc-

asionally given to them. A large glass window in the house gave them light and sunshine, in which they basked in cold weather. For all this care we were repaid by a constant supply of eggs all through the winter, and by February or early in March some of the hens would set, and bring out early broods which would take their places the next season.

Walks and Talks on the Farm.—No. 122.

Last winter I found that there was great danger of my cellar freezing during a cold, windy night. It occurred to me that a little boiling water poured upon the cellar floor would be of some service. I said nothing about it, for I thought I should get laughed at; but after every one else had gone to bed I got a pailful of boiling water and sprinkled it about the floor and shut up all the doors and windows tight. It saved the cellar; and no one in the house ever knew what risk we ran of having frozen potatoes. I don't want to tell tales out of school, but it so happened that I wrote the next month's calendar for the *Agriculturist*, and in one of the "Hints about Work" I suggested this plan. I can recollect that I thought it hardly worth mentioning, but that at any rate it could do no harm.

One of my German neighbors said to me the other day: "That paper you and the Deacon write for is first-rate. I signed for it last year. I did not think I could afford it, but I wanted to see what the Deacon said about you. I wish I had taken it before. It saved me ten dollars."

"How was that, John?" I asked.

"Well, you see," he said, "I have got an awful cold cellar. When the stove goes out at night and the wind blows it's most sure to freeze. I had a lot of potatoes in the cellar, and thought they would all be spoiled. I read what was said in the paper about pouring boiling water on the cellar floor. I tell you it saved the potatoes. That editor is a smart man. I guess he is a German."

The incident pleased and amused me. It shows that one never knows what will or will not do good, and that those of us who "write for the papers" should not be afraid to mention a matter because it seems a simple thing.

John Johnston sends me an ear of his corn. "I think," he writes, "it is a very good kind, and if you have none of it I will send you a bushel for seed if I live until next planting time. It is called the White Flint. I had 158 bushels of ears per acre of 40 lbs. to the bushel. A man who buys a good deal of corn in the ear said he would rather buy this corn at 75 lbs. per bushel in the ear than have it shelled at 60 lbs. per bushel. He said he never saw any so well filled out."

The ear sent me contains eight rows, and there are 64 kernels to the row, or 512 kernels in the ear. My own corn is the common eight-rowed yellow. I got it from Mr. Dewey, who has taken great pains for many years to select the best ears for planting. I have just counted the kernels on one of the best ears, and found 57 in the row or 456 in the ear.

Mr. J. continues: "I drilled my corn at the rate of about five seeds to three feet in the row; rows 3 ft. 4 in. apart. I cultivated it thoroughly, but gave no hoeing except the two outside rows and about six feet at each end of the rows. So many suckers came up no weeds or grass could grow. It was as clean as it could have been

made if I had hoed it all the time. I got some stalks with two ears that gave from 740 to 950 kernels from one planted."

The Washington Co. Agricultural Society appointed a committee to examine a crop of corn raised last year by Mr. James W. Dickey, of West Alexander. The committee report that they selected three average shocks in different parts of the field and husked the corn. They got 19 half bushels of ears from the three shocks, or 3 $\frac{1}{6}$ bushels of ears to each shock. There were 1,104 shocks on the 15 acres. This would give 3,499 bushels of ears, or 233 bushels of ears of corn per acre.

The field had been in grass eighteen years. Last spring, as soon as the frost was out, it was plowed up at an average depth of 2 $\frac{1}{2}$ to 3 inches. The sod was well turned over and harrowed six times before planting. The land was marked out in rows 3 ft. 1 in. one way and 2 ft. 5 in. the other way. It was planted April 20th, and I judge from the report about four kernels were planted in each hill. This is very thick planting. When the corn was partly up it was harrowed with a common harrow. It was then cultivated twice in a row five times in all. At the last working the corn was up to the horse's back.

I have an idea that the report is designed to show the advantage of shallow plowing for corn. To me it shows the advantage of thoroughly working the land and keeping the manure or sod near the surface. Mr. Dickey keeps 950 sheep, and I suppose this field had been pastured for many years. A sod turned over only 2 $\frac{1}{2}$ to 3 inches deep and harrowed six times would be pretty well pulled all to pieces before the corn was planted. It would in fact be equivalent to a top-dressing of manure thoroughly worked into the soil. The frequent cultivating afterwards in warm weather would favor its decomposition and the corn roots would get a liberal supply of plant-food.

It is evident that Mr. Dickey does not believe in shallow plowing, for the committee speak of another 15-acre field of his that had been in corn two years that they thought would yield nearly as much as the other. This field was plowed shallow when in sod and planted to corn, and then plowed "very deep" and planted to corn again.

"It was those 950 sheep," remarks the Deacon, "that did the business. There is nothing like sheep for enriching land."

"I believe in sheep, Deacon," I replied, "but that remark is only true in part. It is not the sheep that enrich the land. A sheep can create nothing. A sheep returns to the land nothing more than it takes from it."

"Don't you think," said the Deacon, "that the sheep enrich your Northern Spy orchard?"

"In one sense yes and in another sense no. If I run a lawn mower over the field every few days and left the grass to rot on the surface I think the land would sooner or later be enriched by the mown grass as much as by the droppings of the sheep."

"The sheep kill the weeds," said the Deacon, "and bring in better grasses and clover."

"Mr. Lawes did the same thing," I replied, "by the use of artificial manures. It is not the sheep."

"I don't see what you are driving at," remarked the Deacon as he got up to go.

"Hold on, Deacon," I cried, "the weather is stormy, and you have nothing to do. What I want to say is that it is the growth of the grass that enriches the land, and not the sheep. Or,

to go back to the real root of the matter, it is the gradual decomposition of the organic matter and the disintegration of the inorganic matter in the soil itself that furnishes food for plants. If we carry off all these plants the land becomes poorer. If we feed them out on the land the soil becomes richer. There is no more actual plant-food in the soil, but what there is in a more available shape. This 15-acre field of Mr. Dickey's that had been pastured for eighteen years furnished a certain amount of plant-food every year from the inert matter in the soil. The air decomposed it, the rain dissolved it, and the roots of the grass took it up and the leaves organized it into food. The sheep ate the grass, converted the food into wool and mutton, and their droppings returned to the land some 90 to 95 per cent of all the nitrogen, phosphoric acid, and potash that the grass contained, and a still larger proportion of lime, soda, magnesia, and other mineral elements of plant-food. This plant-food was again taken up by the grass, together with the amount gradually rendered available by the decomposition of the soil. If the latter amounts to more than the small quantity removed in the wool, bones, and flesh of the sheep, the land gets richer and richer every year."

"You mean," says the Deacon, "richer in available plant-food; not that there is absolutely any larger amount in the soil. Now, what I want to know is what becomes of this extra amount of available plant-food. If it is soluble, why is it not washed out by the rains and lost?"

"That question opens too big a subject for us to discuss this evening. I may remark, however, that if you pour a solution of ammonia, potash, or phosphoric acid upon a soil it unites with certain ingredients in the soil and becomes comparatively insoluble. Again, in an old pasture the roots of the grasses contain a large amount of the plant-food which has gradually accumulated. An old sod contains several tons of organic matter per acre. And so it is not at all a difficult matter to see what becomes of the plant-food which is gradually developed from the soil. It is stored up in the soil and in the sod; and when you plow up the land the sod is decomposed and furnishes plant-food for the next crop. That great corn crop of Mr. Dickey's got more or less of the plant-food which had been gradually developed from the soil and stored up during the last eighteen years. The sheep did not create this fertilizing matter; they merely helped to preserve it and turn it to good account. The plant-food comes from the soil."

The Deacon was silent a few minutes, and then said: "I don't see, according to your theory, why our lands should not become richer instead of poorer."

"It is because so few farmers take pains to save the plant-food which is gradually developed from the soil. Instead of keeping sheep they sell the hay. Instead of draining the land they let the surface water run away with the soluble plant-food. Instead of cultivating the land and developing the plant-food they let the weeds rob the growing crops. Instead of carefully saving the manure they let the best portion of it run into the nearest ditch."

Farmers do not differ essentially in these matters from other people. The man that knows how to make money and to save it is the exception. It seems an easy matter to get rich, and it seems equally easy to make the land rich—on paper.

Let two young men begin life at twenty years of age with \$10,000 each. If one can so manage his property as to make it bring in ten per cent per annum, and can save and invest the whole, he will find himself worth when seventy years old \$229,347.98. Let the other spend his income, and draw \$500 a year on his principal, and his income will grow less and less every year, and at the end of ten years both principal and interest will be reduced one half.

And so it is with farming. The plant-food in the soil is the farmer's capital. That which lies dormant pays no interest. If land is left in a state of nature a small portion of the plant-food becomes annually available. It pays a low rate of interest. By cultivation, draining, etc., the plant-food is more rapidly developed, and a higher rate of interest may be obtained.

"I see what you are driving at," says the Deacon. "You mean that if a farmer tills his land he will grow good crops, and that if he sells these crops he is spending his income and drawing more or less on his principal; but that if he plows under these crops or feeds them out on the farm he is adding to his capital, and gets annually a larger income. In other words, his farm is getting richer and richer and more and more productive. This is all very well. But a farmer has got to sell something to get money to live on."

"No one, Deacon, understands that better than I do. All I want to show is that if a man can invest his money at a good rate of interest, and add the income or even a part of it every year to the principal, he will get rich; and it is equally true in regard to increasing the fertility and productiveness of the farm. Of course, I do not mean that a farmer should not sell anything; but he should aim to sell such products as carry off the least quantity of plant-food. For instance, butter carries off *nothing* of any value as manure; pork carries off scarcely anything; animals of all kinds carry off comparatively little; wheat flour carries off very little—the plant-food of a crop of wheat is nearly all in the straw, chaff, and bran."

"Your mangel-wurzels, judging from the way you have to manure them," remarks the Deacon, "must require a great deal of plant-food."

"True, Deacon, but you know that I do not sell them. They are fed to the sheep, cows, and pigs. The cows carry off nothing, for I sell nothing but the butter; the pigs carry off very little, and the sheep only from five to ten per cent. Taking leaves, roots, and bulbs, I do not think I lose, or need lose, over three per cent of the plant-food contained in the crop. And it is so with clover when fed out on the farm. Taking the roots into the account, I do not think we lose, when the crop is fed out on the farm and the manure carefully saved, over three per cent."

"This is all very well," said the Deacon. "I know, of course, if a man has \$10,000 to start with, and can invest it at compound interest and save it, he will become a rich man. But the trouble is to get the \$10,000."

"I think you and I, Deacon, were worth \$10,000 a piece when we were 20 years old."

"I was not worth \$1,000," said the Deacon.

"You mean," I replied, "that you had not one thousand dollars in cash. I don't know that I had one hundred, and yet I think, if we had only known it, you and I were worth \$10,000 each. There was that amount of capital locked up in us. The truth is, very few

people appreciate the real value of a healthy, active, industrious, energetic, sober, and intelligent man. Ten thousand dollars is a low price for him. If such a man can earn and invest at compound interest at ten per cent \$1,000 a year, he will at the end of fifty years be worth \$219,347.98."

Earning, saving, and investing money is the secret of getting rich. Developing the resources of our land, saving them, and so using them that they will produce crops that carry off little plant-food is the secret of making our farms rich. We should not let our plant-food lie idle. We should keep it moving. To do this to the best advantage is a great art and a profound science. In this country there is everything to stimulate us to advancement and improvement in agriculture. We own the land. If we can manage to secure a livelihood, and at the same time add to the fertility of our farms, we are in a fair way to get rich. And it is well worth while to make a decided effort in this direction.

There is a good prospect for good farmers. "I don't know about that," said a neighbor; "if I could sell my farm I would quit the business. And if I can't sell, I mean to rent it. As things are now, it takes all I can raise to pay my hired help."

"That is because wages have been too high, and because you do not raise enough per acre. Wages will be lower and prices higher; and if you will farm better you will make money."

"I can't see it in that light," he replied. "My wheat crop last year did not average five bushels per acre."

"It was one of the worst seasons for wheat we have had for many years."

"We have too many bad seasons."

"Well, what are you going to do about it? It is no worse for you than for others. You should not go to sea expecting nothing but fair weather. You should prepare for storms. If you had had a good crop of wheat last year, and a good crop of barley, and a good crop of potatoes, and a good crop of choice apples, you would feel richer and jollier than Vanderbilt did last October when New York Central stock was down to 79½, Western Union to 43½, and Lake Shore to 57½, and few buyers at that.

"I do not say that a farmer can always be sure of good crops. I know that such is not the case. But if you would farm better—if you would drain your land, cultivate it thoroughly, kill the weeds, make more and richer manure, you would stand a fair chance of getting good crops even in a bad season."

I wish Mr. Bliss, instead of offering prizes for the greatest yield of potatoes from a pound of seed had offered them for the largest yield per acre. The Deacon and I have just been reading the report of the committee. It is an interesting document. The Deacon seemed to think there must be some mistake. I told him I once knew a gardener who accidentally dropped a potato near a hot-bed, and it got covered with some manure and came up. It was not in the way, and so he hoed a little earth round it and let it grow. The ground was very rich, and the plant threw up a great many suckers. Every few days he pulled a little fresh earth to it, and before autumn he had a hill a good deal larger than a half barrel. He dug over a peck of potatoes from that one hill.

"What variety was it?" asked the Deacon.

"I did not ask. I saw the plant while it was growing, and have no doubt it produced an

immense crop, but I attributed it to the manure and the extra care. It never occurred to me that it proved that the variety was anything remarkable."

"I can believe a story of that kind," says the Deacon. "He got say 15 lbs. of potatoes from one potato, which may have weighed a pound. But in these premium-potato trials one man got 607 lbs. of potatoes from one pound of seed, and the lowest yield in the 20 different trials, by different people, in different parts of the country, was 250 lbs. from one pound of seed. We usually plant 6 bushels of seed per acre, and get about 120 bushels—or say 20 lbs. of potatoes to 1 lb. of seed. If we could grow 250 lbs. from 1 lb. of seed, we should get 1,500 bushels of potatoes per acre; or if we could grow 607 lbs. from 1 lb. of seed, we should grow 3,642 bushels per acre."—The Deacon laughed a quiet laugh and shrugged his shoulders, but made no further remarks.

"The experiments, Deacon," I replied, "are designed to show the wonderful vitality and productive powers of two new varieties of potatoes. We must take the facts for what they are worth. No farmer would think of planting potatoes as these were planted. We want to raise big crops per acre. These experimenters tried how much they could get from a pound of seed. They cut their pound of seed into a hundred or so pieces, with never more than one eye in a set, and frequently with less. They planted one of these hundred pieces in a hill. For anything that appears to the contrary, each hill may have occupied a square rod. If the hills were 6 feet apart, there would be 1,210 hills in an acre; and if the pound of seed planted 100 hills, as the report gives us to understand was sometimes the case, and the produce was 250 lbs., the crop would turn out about 50 bushels per acre. If it was 607 lbs., which is the largest yield reported, it would be about 120 bushels per acre. The committee say 'the hills were invariably placed a considerable distance apart, rarely less than three feet each way, and oftener further.' If they were four feet apart, there would be 2,347 hills in an acre, and if the hundred hills yielded 250 lbs., the yield per acre would be 6,837½ lbs., or a little less than 114 bushels of 60 lbs.; and the largest yield reported would be (100 : 2,347 :: 607 : 17,281), 17,281 lbs., or 288 bushels per acre."

"That looks more reasonable," says the Deacon. "I usually plant 3½ feet apart each way." This would give 3,556 hills per acre, and the smallest yield reported would be about 143 bushels per acre, and the largest about 360 bushels per acre.

I know very well that this is not doing these varieties justice. They are doubtless capable of producing much larger crops if more and larger seed had been used. And as I said before, I hope that hereafter the prizes will be offered for the largest yield per acre rather than for the largest production from the smallest quantity of seed.

A New Method of Hurdling Sheep.

Some time ago an English gentleman devised a method of irrigating grass land and a method of successfully feeding of sheep upon the enormous crops of grass he is thus enabled to grow. The mode of irrigation was described and illustrated in the *Agriculturist* for December, 1873. It will interest many of our readers to know the manner in which this enterprising Eng-

fishman fed 66 sheep for six months upon each acre of ground thus irrigated. He had constructed a quantity of hurdles of a peculiar

vents any trespassing upon the other side of them, and by using two rows of hurdles the sheep are kept in the narrow strip between

that here. The labor of attending to 400 sheep so closely fed would be at a minimum of cost. The feeding of 400 sheep a whole summer should be worth \$1.80 each at one cent a day per head, which is the usual payment for pasturing sheep in flocks for drovers. This would be equal to \$118.80 per acre. These figures would seem to leave a margin for profit even for us. They seem honest; but although figures are said to be perfectly trustworthy and truthful we have in practice so often found them to belie their general character, that we would not in this case pin our faith upon them without some experiment. Nevertheless we feel sure about the value of the hurdle and this plan of using it in many cases. Some few farmers here grow rape for late summer feed for sheep, and many thousands might well do so. For penning sheep upon rape these hurdles are very much better than the ordinary flat ones which have to be firmly set in the ground and tied together, while these are self-sustaining and instantly turned over. This great advantage should make them very acceptable to us.

Fig. 1.—INTERIOR OF COVERED CATTLE STALLS.

Covered Stalls for Cattle.

The use of covered stalls for feeding cattle and preserving manure is becoming very general amongst the better class of English farmers. Occasionally they are made use of by farmers

description. They are 12 feet long, and are made of a stout pole bored with two series of holes 12 inches apart. Stakes six feet long are put into these holes, so that they project from them three feet on each side of the pole. One series of holes is bored in a direction at right angles to that of the other, and when the stakes are all properly placed they form a hurdle the end of which looks like the letter X. The engraving below shows how these hurdles are made and the method of using them. A row of these hurdles is placed across the field. The field in which they are used consists of six acres. A strip of 10 feet wide is thus set off upon which 400 sheep feed. They eat up all the grass upon this strip and that which they can reach by putting their heads through the hurdles. The hurdles are then turned over, exposing another strip of rather more than four feet wide at each turn. When this is fed off

them. Their droppings are therefore very evenly spread over the field, and it is very richly fertilized by them. At night the sheep are taken off and the grass is watered. The growth is one inch per day under this treatment, and when the field has been fed over, the sheep are brought back again to the starting point and commence once more to eat their way along.

As to the practicability of this method with us under our circumstances there is some question. The cost of the apparatus for irrigation is very large. The yearly interest, on the cost and

in this country with the best results. That they may be the more generally known we have prepared the accompanying engravings to show their structure. Fig. 1 shows the ground plan of a shed containing fourteen stalls, each ten feet square with a passage way in the center of four feet wide. Fig. 2 shows the elevation of the building with the arrangement of the doors. It is of two stories, the upper one being used for the storage of straw, hay, or roots or the preparation of the feed. Fig. 3 shows the interior of the building, with some of the stalls upon one side. With these views the following short description will be more readily understood. The shed here described is 70 feet long by 24 feet wide, having seven stalls upon each side. It is built of plain boards and scantling, and one of the cheapest character will answer every purpose as well as the most costly building; the shelter and preservation of the manure being the chief objects in view. There is a door at the rear of each stall divided into upper and lower halves so that the upper one may be opened for air and ventilation. There is a large door at each end of each row of stalls, and the divisions between the stalls are made of movable bars. These bars being taken away a wagon may be driven through the building from end to end for the removal

Fig. 2.—ELEVATION OF COVERED CATTLE STALLS.

SHEEP HURDLES AND MANNER OF USING THEM.

the hurdles are again turned over. The chevaux-de-frise presented by the hurdles pre-

the maintenance together, is \$57 per acre in England. It would not be much more than

taken away a wagon may be driven through the building from end to end for the removal

of the manure. The floors of the stalls are sunk three feet below the surface. Here the cattle are fed and well bedded with straw. If the straw is cut into lengths of at least three inches the manure is so much the better for it. The litter and the manure remain in the stall during the whole winter, and as they gradually accumulate and the floor rises the bars are raised. Each bar fits into sockets in the posts of the building, and is held into its place by pins. The feed trough is made to slide up and down upon iron bars as may be needed. There is also a rack slung from the roof or ceiling above, between each pair of stalls, for long straw or hay, which is given once a day to

the stock. The most appropriate and economical feed for the stock in these stalls is cut hay and meal and roots, either steamed or otherwise. The richer the feed given the richer will be the manure.

An Improved Horse-Trough.

There are a great number of horses which have the wasteful habit of throwing their feed out of the trough by means of a side jerk with the nose. This is especially the case with horses that are fed with cut feed, and it is in

IMPROVED HORSE TROUGH.

the search for the loose meal which finds its way to the bottom of the trough that the mischief is done. We have prevented the waste by simply nailing a few bars across the feed-trough as shown in the engraving. The horse then finds it impossible to throw his feed out, and must take it as he finds it. The bars should not be more than a foot apart.

Burning Shells to Make Lime.

The engraving shows the usual method of burning shells for lime in pits or heaps. This may be done very readily in places where shells are abundant and stones for building kilns are scarce, as in localities along the bays and inlets along the coasts. In these localities shells are the only available source for a supply of lime, and this valuable fertilizer can not be procured in any other way except at great expense. To burn the shells a level spot should be made about twelve feet in diameter. A quantity of rough brush-wood is then laid down several inches in thickness, leaving four or more open draft-ways or flues from the outside to the center. Fine kindling-wood is laid

in these draft-ways. A flue of sticks, placed upon their ends, is also made in the center of the heap connecting with these draft-ways. Upon this lower layer of wood a foot in thickness of

HEAPS OF SHELLS FOR BURNING.

shells is placed, then a layer of wood and then one of shells, alternating with shells and wood, and gradually drawing in the heap until a conical pile about eight feet high is made. The central flue is carried up carefully to the top as the heap is made. The heap is then covered with swamp-grass or sea-weed or sods, upon which earth is thrown and closely beaten down. The hole at the top is left open at first. Then fire is put to the bottom of the heap at each of the draft-holes, and when the fuel is well kindled the holes are closed or partly closed with flat stones or sods so as to keep the fire from burning too quickly. When the heap is all on fire a flat stone is placed over the central hole, and the drafts are very carefully watched and managed so as to keep a moderate red-heat inside the pile. A ladder should be kept at hand to reach the top of the heap when necessary. As the heap gradually settles down the cracks which will appear should be closed with fresh earth. If a large hole should happen to be made a few shovelfuls of shells should be thrown into it, a quantity of damp grass or weeds placed upon them, and covered closely with fresh earth. In three days the shells will be burned into lime.

The best way to use the shell-lime is to draw it as soon as cooled to the field where it is to be spread and deposit it in small heaps one or two rods apart each way, according to the quantity to be spread. If half a bushel is placed at each heap, and the heaps are one rod apart, there will be 80 bushels of lime per acre. If the heaps are two rods apart there will be 20 bushels per acre, and if the heaps contain one bushel there will be 40 bushels per acre.

A Calf-Feeder.

Patience is not a universal virtue, and a great deal of patience is required in teaching a calf to drink. It is not an uncommon thing to see the milk spilled by the calf, and the poor creature bawled with the empty pail by its more intelligent owner as a gentle intimation that it must not do so again. Those who would rather use a lit-

CALF-FEEDER.

tle ingenuity in place of the required patience may avail themselves of the contrivance here figured. It consists of a tube fastened to the bottom of the feeding pail so that the milk can enter the tube by the bottom and be sucked up by the calf. A piece of india-rubber tube, with a nozzle of elder-wood, from which the pith has been forced, placed in the end to prevent collapse, will answer the purpose. After the calf has had a short experience with a pail of this kind it is usually the case that it takes to drink-

ing without the use of the tube, and it may then be removed.

Protection for a Circular Saw.

The circular saw is a necessary addition to the horse-power on every well-appointed farm. Besides its use for cutting fire-wood, it can be

PROTECTION FOR CIRCULAR SAW.

made of great help in preparing lumber for the constant repairs and alterations which are needed. But such a saw requires to be used with caution. The table needs to be made very strongly and set very firmly. The greatest care is needed to avoid flying splinters, pieces of bark, or loose knots while the saw is in operation. The edge of a saw two feet in diameter, revolving 3,000 times a minute, moves with a velocity of 300 feet in a second, and any pieces or splinters which may be thrown over the saw moving with equal velocity, acquire force sufficient to do a serious injury should they strike any person. This danger may be avoided by hanging over the saw (from the ceiling or beam above) a frame of strips of plank made as shown in the accompanying engraving. This is better than hanging a piece of solid plank, which is sometimes done, because the plank obscures the sight, while the frame of strips does not, and the operator, being able to see between the strips, can view everything which is going on. The spaces between the strips should not be more than half an inch each in width.

A Square Harrow.

At the request of "W. B. S." we give an engraving of a square harrow jointed in the middle. It is made of 4x4 or 3x4 hard-wood timber. Four pieces 3 feet long and eight pieces 2½ feet long are required. These are mortised together, as shown in the engraving, and each mortise is secured by a wooden pin or a one-quarter inch carriage bolt. The two wings are connected by two eye-bolts in each,

A SQUARE HARROW.

through which a long rod passes. The rod is secured by a nut at one end and a head at the other. The harrow is drawn from one corner. It contains 32 to 44 teeth of three-quarter inch square iron, each 14 inches long. For a light harrow the teeth may be of half-inch iron and the timber of 2x4. There should be a light carriage bolt put through the end of each bar to prevent it from splitting, and the teeth should be placed so that their edges will be in a line with the line of draft.

A Sheep-Rack.

In feeding sheep in winter we have found that unless the hay-rack is properly made the sheep will get their heads through the bars and wear the wool from their necks, besides filling the wool upon their backs with grass heads and clover seeds. This is a great inconvenience, and injures the sale of the wool, besides wasting some of it, which is pulled off by the bars of the rack. To prevent all these troubles we have used a rack such as is here figured. For large sheep it should be 3½ feet high at the front. The bars are only three inches apart. They should be made of ash, chestnut, or oak strips, dressed and smoothly sand-papered, and ¾ inch thick by one and a quarter wide. The front of the rack should slope backwards three

IMPROVED SHEEP-RACK.

or four inches. This prevents hay or clover dust from falling out upon the sheep's heads. At the rear of the rack sloping boards are fitted, so that as the hay is consumed it falls down to the bars at the front where the sheep can

reach it. The end of the rack should be closed with bars in the same way as the front, so that young lambs can not creep in and get lost. By want of this precaution a fine, lively young lamb will sometimes get into a tight place, where it may become chilled and die.

A Safety Drain.

Notwithstanding the healthfulness of the farmer's occupation, and the abundance of fresh air around him, he is nevertheless a victim to those diseases consequent upon the breathing of foul air and the neglect of sanitary precautions in a greater degree than any other class of people. It has come to be said, and with justice, that typhoid fever is the farmer's peculiar disease, and that scarlatina and dysentery are the prevalent diseases amongst his children. There are many good reasons for this. One frequent cause is doubtless the drainage from cesspools and manure yards into wells from the saturated ground around them; while another is the exhalation from kitchen sinks which discharge into foul drains, or from putrid places where slops are thrown in the absence of sinks. A perfectly constructed sink is an indispensable adjunct to a healthy condition of the house. A perfect water-trap should be made in every drain. The simple bend in the pipe is not sufficient, because the warm air in the kitchen during the winter season is sufficient to set an air current in motion in the drain pipe which will be strong enough to force a passage through the water contained in the bend of which the air-trap generally consists. But a perfect air-trap may be made as follows: There should be made in the pipe from the sink a bend sufficient to retain a portion of the escaping water. Beyond this another larger bend should be made, and between

DIAGRAM OF A SAFETY DRAIN.

the two bends there should be a short pipe fitted which comes to the surface of the ground at least several feet or yards from the house. The most convenient arrangement is to fit the upper end of this pipe into the bottom of a flower-pot or a wooden box which is sunk in the earth and which is kept loosely covered. This receptacle may be filled with some disinfectant which will destroy the poisonous gas. Shavings saturated with carbolic acid or charcoal saturated with a solution of copperas would answer this purpose. This should be renewed at least every month, or more frequently if necessary. Then any foul air from the drain or the cesspool, or other final receptacle into which the drain may pass, can not possibly enter the house, but at the worst will escape into the air at a distance from it. If, however, the trap is kept supplied with a disinfectant the foul gas will be neutralized.

The above engraving represents the whole arrangement, which should be attached to every farm kitchen; in fact, it is applicable to almost every house in the country and many in towns and cities.

The Imperial Pekin Duck.

A few Imperial Ducks were imported from China last spring, and have excited a good deal of interest among the fanciers. They came from the city of Pekin, and first attracted the attention of the gentleman who imported them by their great size. They were thought to be a small kind of geese. They are very prolific, each duck laying about one hundred eggs in a season, beginning early in the spring. They are white, but it is not the snowy whiteness of the Aylesbury; the bills are yellow and the legs red. The wings are rather short, and they make as little effort to fly as Cochin or Brahma fowls. They are admirable birds for small yards, and can be kept with as little trouble as hens. Their period of incubation is twenty-five days, a little shorter than the common Mallard. We bred them this year in connection with the Rouens. They look nearly a third larger when they first come out of the shell. They have steadily kept the lead of the Rouens, and for the first five months of their history are larger and better birds. At two months old the best Pekin weighed four pounds and the best Rouen three and a half. The Pekins at four months old weigh about twelve pounds to the pair with ordinary feeding. They grow with much uniformity as to size, birds of the same age weighing very nearly alike. What size they will attain in more skillful hands, and when they reach maturity remains to be seen. They are very hardy, are quite easily raised in small inclosures without water to swim in. Water to drink seems to meet their wants quite as well as those of the chickens with which they grow up. They are undoubtedly a thoroughbred fowl and come to early maturity. About sixty birds were raised from the importer's stock—a quartette, which is

very fair success. They make a beautiful show in the brook that runs by his door. He disposed of all of his stock that he would sell long before it was mature, and not a pair probably can be bought at any price before the fall of 1874. If the introduction of this showy Chi-

nese fowl shall do for our ducks what the Asiatics have done for our hens it will mark a new era in poultry raising. *

Fish in Small Ponds.

We receive frequent inquiries, especially from correspondents in the Western States, about the practicability of raising fish in small ponds of surface water. This depends altogether upon the kind of fish it is desired to cultivate and the character of the ponds. We would not advise any one to undertake to cultivate fish of any kind in a small artificial pond such as is often made near the barn for the purpose of watering stock. A quarter-acre pond in a hollow fed only by rains, nearly dry in summer, is too small to do anything with, for pleasure or profit in fish culture. Yet on a retentive soil these small ponds may be greatly enlarged by damming so as to retain all the rains that fall in winter. If a pond of three or four acres can be made, and six to ten feet in depth, there is no difficulty in raising carp, of

which the gold-fish is a variety, and almost any of the coarser sorts of fish. Sun-fish or roach do well in such ponds if they have coarse sand or gravel in which to make their beds. The yellow perch would probably thrive in them, with brush or sticks near the shore on which to affix their spawn and to make a shelter for their young. Of course, in such a pond the number of fish that can be raised is quite limited. They begin to devour one another at a very early age, and this is the strongest characteristic of nearly all the finny tribes through life. It is their destiny to be eaten, and they seem to have no nice sense of gratitude, to reserve themselves for the palate of the culturist, but yield to the first mouth that opens. Constant feeding with animal food will abate their hunger somewhat, and leave more fish to reach adult years, but this, in old communities where such food is scarce, diminishes profits. Where springs are copious, trout can be raised to advantage in small ponds. To raise black bass successfully clear water with a gravelly or rocky bottom is needed, and the larger and deeper it is the better prospect of success.

What may be Expected of a Jersey Cow.

We receive a great many inquiries which show that the characteristics of the Jersey cow are not very well understood even among the readers of agricultural papers. One man wants to know what sort of working cattle they would make, and if the beef is as good as that of the natives. Another is going into the milk business, and wants to know if the Jerseys are the stock he should purchase. Another is near a cheese factory, and thinks the Jerseys possibly may be the best thing for him. A lady of romantic turn has bought a Jersey heifer with her first calf, and suspects she has been badly cheated because she does not get a pailful of milk at night and morning.

The Jersey is not a worker of miracles, and can no more make something out of nothing than any other breed of cattle. She is not even an extraordinary animal, and does but one thing in a superlative way. If one wants to raise working cattle the Devons are beautiful to the eye, and have been trained to the yoke for many generations. If he wants early maturity in the beeves the Shorthorns have no rivals. If he desires a large quantity of good milk for the nearest village market the Ayrshires are hard to beat. But if he wants a pet family cow, giving a small quantity of very rich milk for his own table, he may safely invest in a Jersey cow. It is so rich in cream that we should not like to repeat the statements of credible witnesses, who have milked the cows, poured the milk into the lactometer and measured the thickness of the cream, and churned and worked the butter with their own hands. Five quarts of milk have been known to make a pound of butter. Heifers with their first calves sometimes make five or six pounds of butter a week, and cows ten or twelve pounds a week. In extreme cases, nineteen pounds have been produced in a week from one Jersey cow, of course in flush feed, and with as much meal as she could digest. It is not reasonable to expect that a cow giving milk so rich in butter will give a very large quantity. The average of Jersey herds probably does not exceed eight to 12 quarts per cow daily in good pasture. The milk is very palatable, and children once accustomed to it are apt to be disgusted with the thinner fluids furnished by the milkman. The

butter made from it is of the deepest yellow, very solid and waxy, and of the richest flavor. It is unlike any other butter that comes to the table, and the initiated would not fail to detect it among a hundred samples made from the milk of other breeds. The cream is so highly colored that the milk of a single Jersey cow in a herd of a dozen natives will increase the color of all the butter made from the dairy. There is a steadily increasing demand for Jersey butter in the Boston and Philadelphia markets, where the article is best known. In the suburbs of these cities this breed is very highly appreciated, and the butter brings from 75 cents to \$1 a pound. It is quite the fashion for wealthy families living in the suburbs a part of the year to keep one or more Jersey cows.

The Jersey is valued not only for her milk, but for her esthetic qualities. She is very gentle, eats from the hand, comes readily at call, and takes kindly to petting. She is rather a graceful object upon the lawn and, unlike the deer, requires no wire fence to keep her from straying. Much attention has been paid in late years to improvement in the form and color of the Jerseys, and animals can now be found in many herds very attractive to the eye without any loss of the valuable qualities that characterize the breed. Quite as good Jerseys are now raised in this country as are imported, and we are inclined to think that our best breeders are even more careful of pedigrees and of breeding for valuable points than they are in the Isle of Jersey. They can be bought quite as cheap, and with the additional advantage of a personal knowledge of the breeder as a voucher for the authenticity of the pedigree. In the northern parts of the country the Jerseys are already acclimated, and are found to do quite as well as in their native island. They are not dainty feeders, but eat readily the vegetable refuse of the family, and appear to enjoy it quite as well as the pasture. To do their best, they want abundant feed of good quality and comfortable quarters kept reasonably clean.

Loss of Weight in Dressing Turkeys.

Farmers frequently have occasion to sell turkeys by live weight, and wish to know what is the fair relative price between live and dead weight. In turkeys dressed for the New York market, where the blood and feathers only are removed, the loss is very small. For the Eastern markets the head is cut off and the entrails are taken out. This makes a loss of nearly one-tenth in the weight. A large gobbler was recently killed weighing alive 31½ lbs. After bleeding and picking he weighed 29½ lbs., a loss of 2 lbs., or about one-fifteenth. When ready for the spit he weighed 28½ lbs.—a loss of 3½ lbs., which is very nearly one-tenth of the weight. Where the market requires the New York style of dressing, and the price is 15 cents a pound, a farmer could afford to sell at 14 cents live weight, or less, if he counted the labor of dressing anything. In the other style of dressing, if the price were 20 cents, he could sell for 18 cents, or less, live weight, without loss. Farmers who have never tested the loss of weight in dressing sometimes submit to a deduction of three or four cents a pound from the middlemen, who are interested in making this large difference. We have no means of knowing the exact cost of dressing turkeys, but half a cent a pound would probably be a large estimate. The prevailing higher price of dressed turkeys in the Eastern market

is not owing simply to the difference in the style of dressing, though this has something to do with it. A large portion of the turkeys that go to the Boston and Providence markets are of extra large size, principally of the Bronze and Narragansett breeds and their crosses, raised in Rhode Island and Eastern Connecticut, where the farmers make it a specialty. Whole flocks of young birds will dress about 12 lbs. on the average at Thanksgiving, and 14 lbs. or more at Christmas. Young cocks frequently reach 18 to 20 lbs. dressed during the winter, and adult cocks 28 to 30 lbs. These birds are prepared for the market in the nicest style, and are shipped by the ton for the holidays. They always bring extra prices.

Transportation of Cattle.

It is an undoubted fact that a large amount of suffering is inflicted upon cattle in their transportation from their feeding grounds to the Eastern markets. Money is at the bottom of this suffering, or rather, we might say, that it can not be afforded to transport cattle without it. It is also an indisputable fact that between the farmer who feeds and sells the cattle and the purchasers in the cities who consume the meat an immense part of the ultimate cost of the meat disappears. Possibly this is unavoidable under the present system, but it is not on that account any the less disagreeable to either of the parties out of whose pocket the money which disappears is taken. We are not without a well-grounded hope that this condition of things may soon be changed for the better. We not long ago inspected a consignment of 420 carcasses of beef which were slaughtered in Texas and shipped to New York, where they arrived after a journey including delays of at least ten days. The beef was excellently well preserved in the patent refrigerator cars of Mr. T. L. Rankin, of Emporia, Kansas, and Denison, Texas. This beef was sold in New York at an average price of six cents per pound. At the same time, its first cost in Texas was far more remunerative to the feeder of the cattle than it has hitherto been. Not the least pleasing consideration is that the immense amount of cruel suffering and agony incident to transportation was spared to these cattle. This is particularly exemplified by the absence of the usual extensive bruises with which the shoulders and flanks of beef cattle shipped alive are covered, and which tell a tale of great pain to the poor brutes. The success of this experiment—which will be at once repeated—tends to show that if beef can be shipped from Texas and received in New York in perfect condition, with the advantage of a gain of 50 per cent in the receipts of the feeder and a saving of 30 per cent in the outlay of the final consumer in the cities, it may also be transported from Illinois, Kentucky, Ohio, or Iowa with even greater facility and an equal gain to the parties interested. Here is a matter for Western farmers to consider. They are really but 48 to 60 hours from New York, Boston, or Philadelphia. If it is demonstrated that beef can be kept in these cars perfectly well for ten days it is still easier to keep it two to three days. The farmer will save the freight upon the offal, or 45 per cent, by shipping beef instead of cattle. If by the exercise of associated effort Western cattle can be slaughtered on the farmers' account, shipped in their own cars to their own agent in the East, and sold for their account, there will

[COPYRIGHT SECURED.]

TRIAL OF SHEPHERD DOGS.

clearly be nothing lost between the producer and the consumer and nothing that can not be reasonably accounted for. We understand that the cost of these ears is \$1,100 each, and a joint-stock company of Texan cattle-men own and operate those which are now in use. The train, by express contract with four connecting railroad lines, is sent through without delay, and at the rate of thirty miles an hour upon part of the route. We commend these facts to the consideration of Western farmers.

 The Shepherd Dog.

We are indebted to the London Field for the picture of a Scotch shepherd dog at his work. It represents a field trial of dogs, for the handsome prize of fifty guineas (\$260), which was held at Bala, in Wales, in October last. The Welsh sheep are small, active, and wild, and no better animals for testing the skill of the dogs could have been selected. The dog whose portrait is here given was a pure-bred Scotch "colley," known as Sam, and his exploits certainly go far to make us believe that a dog by training and education can be made to think and reason so as to adapt himself to the vagar-

ies of a willful sheep or a whole flock of them at once. The duty the dog had to perform was to drive three sheep just released from a fold, into a pen with an entrance six feet wide at about 500 yards distant. The difficult nature of the job was increased by the excessive wildness of these small, wiry mountain sheep, which leads them to go in any direction rather than the right one, and each one to scamper off in its own chosen direction. Sam, however, was equal to the occasion, and surrounding, as it were, his three wayward sheep by rapidly executed flank movements, had them safely penned in eleven minutes and a half. This was the first heat, as it might be called. The next effort was rendered more difficult of accomplishment by sundry unlucky accidents. A flock of geese got mixed up with the sheep, or the sheep with the geese. But Sam cleverly extricated his flock from this dilemma. Then two of the sheep jumped over a stone wall, and the third bolted into the river. Sam persuaded the two to come back again, and then hauled the third out of the water by the "scruff of the neck," and soon had them all in the pen. But, by a mistake of his master, Sam lost too much time, and although his performances were by far the best in other respects he was

adjudged only the third place. The prize dog, named "Tweed," was better handled by his master, and by working around his sheep in gradually decreasing circles kept them well together, and brought them into the pen in fourteen minutes. Unfortunately for poor Sam, his master did not know quite as much as he did, consequently the fifty guineas went to Tweed, while all the honor and credit was awarded to Sam, and his portrait is now on view in both hemispheres.

The shepherd dog is not yet an American institution, because we have not as yet availed ourselves of all our excellent facilities for sheep culture. But when our mountain districts and our vast plains become the homes of flocks, then we must of necessity secure the help of this intelligent assistant. In the meantime there are thousands of places where these dogs could be made of great service in protecting our flocks from marauders and in assisting the shepherds to handle them. But, as is seen by the failure of this dog Sam, the shepherd must himself know how to command, because the dog himself obeys him implicitly, and if he does not understand his business the dog fails. Unless the man and the dog understand each other, the best trained dog is at fault.

The Garden Verbena.

The genus *Verbena* is a large one, and we have in almost all parts of the country one or more species which as a general thing are not showy. The first garden Verbenas seen in this country were brought here from Buenos Ayres in 1835 by Mr. Amory Edwards, of Elizabeth, N. J., whose account of the matter will be found in the *Agriculturist* for August, 1866, page 287. Mr. Edwards gave his plants to his brother Scotchman, Mr. Thos. Hogg, the pioneer of horticulture in New York. These Verbenas were the crimson, *V. phlogiflora*, also called *Tweediana*, and a white one, name now unknown. About this time the Verbena became popular in England, and other florists imported them, but to Mr. Hogg belongs the credit of having raised the first in America. At the present time the Verbena is one of the most popular of our garden flowers, each florist raising large numbers annually. Mr. Peter Henderson alone has sent out over a quarter of a million in one season. Those now in cultivation are by no means the original species, but others have since been introduced, and so crossed and mixed that it is difficult to trace the origin of our numerous varieties. The Verbena owes its popularity to the brilliant colors of and long continuance of its bloom, the readiness with which it may be cultivated, it adapting itself to almost any soil, the ease with which it may be propagated from cuttings, and the facility with which it forms new varieties from seed. There is probably no one plant that equals it in the range and brilliancy of its colors, from pure white through the various shades of rose and scarlet to dark maroon purple. A yellow and a black variety have not yet been produced, but they will probably come in with the blue Dahlia. Each year brings numerous new varieties of the Verbena, and the catalogues annually give us a list of new names, whether the plants are improvements upon the old ones or not. For bedding out purposes and producing striking masses of color there is no plant equal to it. The plants when established grow with great rapidity, usually attaching themselves to the soil by the roots thrown out at each joint; when a variety is not disposed to do this it may be kept low by fixing the branches to the earth by means of hooked wooden pegs or wires bent like a hair-pin. In places exposed to strong winds it is a safe pre-

caution to keep them well pegged. Cuttings of the Verbena root with the greatest ease. We have known some varieties strike roots when the bouquet which contained them was placed in water. In early summer they can be propagated to any extent from cuttings an inch long placed in saucers of sand that is kept

those of our garden varieties. The engraving of a bouquet of Verbenas is from the collection of Peter Henderson, and exhibits at about half their true size the leading varieties that are now popular. We can, of course, only show the form, and the brilliant coloring must be left to the imagination. The one at the very

GROUP OF VERBENAS.

constantly wet and exposed to the light; but for propagation in cool weather bottom heat is needed. Verbenas seed freely, and the raising of seedlings is not only an easy matter, but a very fascinating occupation, as it is likely that a packet of seeds will give a number of different forms and colors. Fair success attends the sowing of the seed in the open ground, but plants so raised are much later in coming into bloom than when the seed is started in a hot-bed. A box two or three inches deep filled with light earth forms a convenient seed-pan, and if this be placed upon the heated manure of a hot-bed the seeds germinate freely and the young plants can be set out as soon as they are large enough to handle and the danger of frost is over. In the Western and Southern States there grows a hardy perennial species of Verbena, *V. Aubletia*, which has within a few years been sent out under the incorrect name of *Verbena montana*. It makes a handsome rounded clump, and produces an abundance of flower clusters which are more elongated than

those of our garden varieties. The engraving of a bouquet of Verbenas is from the collection of Peter Henderson, and exhibits at about half their true size the leading varieties that are now popular. We can, of course, only show the form, and the brilliant coloring must be left to the imagination. The one at the very top is "Giant," a dark crimson; at the right of it is "Sable Queen," of the richest dark maroon color; opposite to this "Marmorata" is readily distinguished by its markings; just below and to the right of this is a fine white, called "White Beauty"; only a portion of a cluster of "Rosy Morn" is shown at the left of this; immediately below "White Beauty" is "Monstrosa," which has large, rich, velvety, dark purple flowers; to the left of this is "Belle Davis," scarlet; while the one at the bottom of the picture is "Mrs. Wilson," the petals beautifully marked with dark rose and white.

HORTICULTURAL STEALING.—One of our neighbors after various attempts succeeded in procuring a plant from Europe which, on account of its very tender and succulent nature, had baffled all previous attempts at importation. With great care he nursed the plant and grew it into a shapely specimen for the purpose of exhibiting it at the Pennsylvania Horticultural Society's September show. Our friend took pride in presenting a plant never before exhibited in America, but his pride was

changed to chagrin at finding when he came to remove his plant that it was despoiled of several of its branches. Some rascal could not resist the temptation to secure cuttings. It is mean enough to steal plants from one's grounds, where the grower takes it upon himself to guard them, but one who places a rare plant in an exhibition relies upon the honor of the community, and he who would mutilate a plant so shown is guilty of the meanest kind of stealing. We have no doubt the officers of the Pennsylvania Society would be very glad to make an example of this horticultural thief. The plant is of that delicate habit that he will probably not succeed in raising it; but we hope that he may in order that it may daily remind him of what a sneak thief he is. How a man must enjoy a plant obtained in such a manner!

HORTICULTURE in New Zealand is making rapid progress, but it sounds very odd to hear of a Chrysanthemum show being held in May.

An Ornamental Evergreen.

BY AL FRESKO.

I am an advocate for the planting of ornamental evergreens in suburban gardens; and as evidence of this fact, state that I have eighteen species in cultivation around my residence, and still find ample room for bedding and other plants. In selecting them I studied their adaptability (as regards ultimate growth) to each locality, as well as variety in outline, tint, and habit. Evergreens are at all times beautiful objects, giving variety during the summer months, and in winter lending a charm to the otherwise dreary and desolate garden. When flowering plants have been robbed of their jewels and the tinted autumnal leaves have passed away with the Indian summer, we have nothing left to please the eye save evergreens. In planting evergreen trees and shrubs, adaptability, hardiness, and variety in tint and outline should be studied so as to produce a pleasing effect, and thereby avoid the sameness so often visible in villa gardens, where good taste is frequently outraged by the planting of Norway spruces and Arbor Vitae in formal rows like a file of grenadiers at drill. No evergreen in my small collection has given me so much satisfaction as the "*Thuja aurea var purpurea-marginata*." This appears to be a hardy variety from seed, and I have reason to believe not generally known or duly appreciated. During a rummage in a small and neglected nursery I found several plants nearly covered by rampant growing weeds. Upon inquiring the name I received the one given above. The only satisfaction I could obtain regarding its origin was that "the plants had been purchased at a nursery." After considerable discussion the owner consented to part with two plants for a trifle, and they are now great favorites with me.

In spring the young wood becomes tinted with bright yellow, which gradually changes to a light green by the middle of August. In autumn as the maple leaves assume their beautiful hues the bright green of the Arbor Vitae gives place to a purple tint which gradually changes to a deep purple by mid-winter. At the present time (Dec. 24th) the trees are attractive objects, more especially when the sun is shining and the earth is covered with snow. I inclose a small branch, and I have to request that our good friend the editor will give his opinion regarding its value as an ornamental plant. It is a rapid grower with erect branches like the old Chinese Arbor Vitae. With regard to its hardiness I need but refer to the fact that my largest specimen occupies a very exposed situation, and last winter escaped uninjured, but its next door neighbor, the *Thuja borealis*, was nearly destroyed by the frost, and is lingering out a miserable existence.

[The specimens sent by our correspondent, who lives a short distance north of Philadelphia, are certainly very marked and distinct, and apparently a variety of the Chinese Arbor Vitae (*Biota*) rather than a *Thuja*. We do not find the name in any European or American catalogue at hand. It is certainly deserving of propagation.—Ed.]

The Cultivation of Currants.

We were not aware, until a recent visit to Green's Farms in Connecticut, that the cultivation of the currant filled so large a place among the small fruits. Here it is made a specialty by several of the fruit-growers, and is found to

pay better than any other of the small fruits. The varieties relied upon for the main crop are the Versailles and the Cherry. The plants are grown from cuttings. These are taken from the present year's growth, cut into pieces six inches long, and planted in drills about 16 inches apart and four inches apart in the drill. The soil is made rich, kept clean by frequent cultivation, and these cuttings make strong roots and throw up a stem from one to two feet high the first season. A part of the profit of the business lies in the sales of cuttings and bushes, which are sold at wholesale, the cuttings at \$3 per M., and the plants at \$30 per M. In making a plantation, the young plants are set in rows five feet apart and four feet in the row. The plants are set in rich soil, and kept clean by frequent cultivation through the entire season. They are allowed to throw out side-shoots and to grow in the bush form. They receive no trimming except the annual cutting back for the supply of wood for the market. Some of the plantations are made in the pear orchard, in line with the trees and in rows between; and where the ground is rich enough they bear quite abundantly in the shade. A small crop is looked for the third year. A full crop is from one to two tons to the acre, which brings three or four hundred dollars, according to the state of the market. The demand for the wood and plants among nurserymen is so lively, that these pay quite as well as the fruit. The chief enemies are the currant-worm and the borer. The worm is easily destroyed by the timely application of white hellebore. No time is lost in using this remedy when the enemy makes its appearance. Carbolic soap is also used with good results, and is a much cheaper remedy. About a pound is dissolved in five gallons of water, and the liquid is applied by a portable force-pump. Every worm is destroyed that the liquid touches. The shoots in which the borer makes his appearance are immediately cut away, and these remedies keep the plantations remarkably clean and thrifty. The sales from three acres on one of the fruit farms was five and a half tons, at an average price of twelve and a half cents a pound, net, or \$1375. They are packed in nice fruit boxes and sent to the New York and Boston markets. The fertilizers mostly relied upon after the thorough preparation of the soil are bone-dust, superphosphate of lime, and leached ashes. These are not applied in very large quantities. Much dependence is placed upon thorough cultivation and the timely application of remedies for insects. Some of these plantations have been in bearing for ten years, and are apparently in as good condition as ever. By the removal of old wood and the application of fertilizers they may be indefinitely continued. It is found to be very much less trouble to take care of currants than of strawberries; they are more easily picked, reach market in good condition, and keep better. The demand for them is quite rapidly increasing. It is a popular crop with the growers and the sugar dealers.

CONNECTICUT.

Notes from the Pines.

THE BALANCE OF THINGS is beautifully observed in nature. One of the most charming as well as instructive books I ever read was one by Dumas and Boussingault, the translated title of which reads, "The Physical Balance of Organic Nature." A translation of it was published in this country many years ago, and it is

one of the works which ought always to be kept in print. It shows in the most graphic manner the relations of plants and animals to one another and of both to the earth and the air. In the natural state of things the balance between plant and animal life, and the relations both have upon the earth upon which they live and the air which surrounds them, are most admirably adjusted, as are the effects of the carnivorous animals upon those which live upon vegetables. In our cultivation we break up the natural balance. We raise an excess of certain plants, and the insects that live upon such plants increase to a wonderful extent; we kill off insect-eating birds, and complain that insects destroy our crops. We destroy every snake we meet and shoot every owl upon sight, and look about for remedies for trees and shrubs that have been gnawed by mice and rabbits. In our cultivation we have undertaken to supplant nature in producing better crops of better plants than would naturally grow, and we must accept the rest as the natural consequence. We put thousands of plants all of one kind in a field, and we must expect that the insects that feed upon these plants will congregate there, and if we are so foolish as to kill snakes it is only a natural consequence that mice abound. This remembrance of the excellent work of Dumas and Boussingault was brought up by my attempt to cultivate some choice

EXOTIC AQUATIC PLANTS in a tank in my greenhouse. I had planted out the beautiful New Holland *Aponogeton distachyum*, *Limncharis Humboldtii* from Central America, the blue Water-lily, *Nymphaea caerulea*, from Egypt, and other choice things. The plants grew finely, and some were coming into bloom, when I discovered, to my dismay, that the water was alive with "wrigglers," as the larvæ of the mosquito are called. The plants were very desirable, but the larvæ, however interesting they might be as animals presenting the remarkable phenomenon of breathing through their tails, were so many torments in prospect. I had complied with a part of the conditions of a natural pond. I had my plants, soil, and water. We are accustomed to think that mosquitoes are of no use. This is a mistake. They play an important part in preserving the balance of nature. It is not the sole mission of this most useful insect to disturb one's sleep and to inflict unpleasant stings. These are only incidents in the generally beneficial career of the whole race of mosquitoes. Possibly one out of ten thousand mosquitoes reaches perfection and seeks human society, while 9,999 before they emerge from the state of wrigglers fulfill their destiny as food for fishes. Why, one man in the State of New York raises wrigglers by the quart as the best possible food for his young trout. In my case there was but one remedy, and that was

FISH.—So I made a call upon Mr. Greenwood, the dealer in aquaria in College Place, who fitted me out with some sticklebaeks and other small fry, which at once gorged themselves on "wrigglers," and in a short time cleared them out entirely. In some city, Boston I think it was, the water suddenly became bad and undrinkable. An investigation showed that the trouble was due to minute aquatic animals, and that the fish of all kinds were carefully kept out of the reservoirs by means of fine gratings. Fish were admitted, and the balance of nature being restored the trouble ceased. Among

WINTER-BLOOMING PELARGONIUMS or Gera-

niums the variety called Master Christine is to be especially commended. Last spring Mr. Chitty, of Bellevue Nursery, Paterson, N. J., sent me this, among other novelties in bedding Geraniums. The plant bloomed in the border all summer; when cold weather approached the plant was taken up, severely cut back and potted, and the cuttings put in a propagating box. The old plant soon recovered, and has flowered abundantly, and the rooted cuttings, though only two inches high, are showing flower-buds. The flowers are of good shape, and of an unusual color, being of a bright, lively, and rather dark pink. Another good winter-bloomer is

JEAN SISLEY.—It is scarcely possible that we shall have a more intense scarlet than this presents; it is perfectly dazzling, and when we add that the flower is almost perfect in shape we may regard this as the best of its class. I believe that last winter I called attention to the great value of the

DOUBLE CHINESE PRIMROSE as a window plant. If the plants are procured before they have been subjected to the heat and atmosphere of a greenhouse, and allowed to come on gradually in the sitting-room window, they will bloom on all winter in the most satisfactory manner. But it will be useless to bring plants that have been forced at all into window culture; the leaves will fade, and the flowers will blast in the bud, and be uncomfortable subjects altogether. This fall Mr. John Saul sent me his new double white, "Mrs. John Saul." My plant is a small one, but it has flowered enough to show its great superiority over the common double white. Not only are the flowers more double, but the petals are beautifully fringed, and they have just the slightest possible tinge of pink, a shade so delicate that it can only be seen when contrasted with a pure white flower. It is a most valuable addition to our winter-blooming plants.

PROPAGATING ECHEVERIAS.—When Echeverias like *E. secunda glauca* get a long stem they should be cut off and the rosette of leaves put in sand to root. This I did with a lot, and intended to set out the stumps for them to grow new shoots. Not being ready to plant them at once I put them in a flower-pot and covered them with damp moss and set near the hot-water pipes. Two or three weeks after I took them out to plant, and found young shoots had started in the greatest abundance, apparently many more than would have come had they been planted in the ordinary way.

Special Fertilizers for Particular Plants.

BY PETER HENDERSON.

A man called at my office last spring with some dozen bottles as samples of special manures, indispensable, he said, as fertilizers for certain kinds of plants. He had those with him that he claimed to be specially prepared for cabbage, corn, potatoes, wheat, grass, lawns, beets, etc., etc. He even invaded Flora's realm, and declared that his nostrum for roses was a specific for any languid capers of this sometimes rather coquettish queen of flowers. His own arguments, which were rather plausible and glibly uttered, were backed up by numerous certificates—authentic, I have no doubt—where his "potato fertilizer" had worked wonders with some, with others his "corn manure" had been of undoubted benefit, and so on all through the list.

Now, I have no reason to say that the vendor of these fertilizers was a quack, except the broad fact, gathered from an experience of thirty years, that has shown me that it makes but little difference with what fertilizer a crop is treated provided the soil is properly pulverized and the fertilizer applied in proper proportions according to its strength. Had all his separate kinds of fertilizers been taken from the same bag (provided that bag contained a good article of bone-dust or guano) the result to his patrons would have been the same, whether he had used it on one or all of the crops that he had special prescriptions for.

There are few market gardeners in the vicinity of New York but who have at one time or another been obliged to take anything they could get for fertilizing purposes, and the difference has never been perceptible when manure from horse stables or cow stables has been applied, or when \$100 per acre of bone-dust or Peruvian guano has been expended, and these all are used on a dozen different crops without any discrimination. Agricultural chemistry may be all very well in some respects, but if it gets down to such hair-splitting niceties as to analyse scores of special plants, and tell us that we must feed each with just such food as these parts show it to be composed of, then our common sense, born of practical experience, must scout and ridicule such nonsense.

Plants, like animals, are not so much kept in good health by the special kind of food given as by the proper quantity and the conditions surrounding the individual when the food is received, and what proper temperature and pulverization of soil may be to the plant, air and exercise and also proper temperature are the corresponding conditions necessary for healthy animal life. Who will say that the beef-fed English laborer is in any way the physical superior of the Irishman or Scotchman whose daily food has been only oat-meal and potatoes? You get usually fine and nearly equal development in each case, but it is a condition due to a natural use of the muscles in the open air in an exhilarating climate rather than to anything special in the food. It would be quite as reasonable to tell us that a special food, chemically considered, is necessary for each class of our domestic animals as for our domestic plants, and none but the veriest charlatan or ignoramus will do either.

Fruit Growing in Utah.

Most people who visit Utah territory are surprised to see the progress already made in the cultivation of fruit. Standing upon the roof of the tabernacle which overlooks the dwellings and gardens of the Salt Lake City, one sees in every direction fine ornamental trees in the streets, and apples, pears, peaches, plums, apricots, and cherries in the gardens. Few cities or rural villages in the East are as well supplied with the large and small fruits. The city was laid out on a liberal scale, and the building lots are large enough to admit of a garden and orchard for every family. The fresh, virgin soil, the bright sunny skies, the absence of insects, and the timely irrigation with good cultivation are the causes of this almost uniform success in the growing of fruits. The grounds of W. Jennings in the heart of the city are on a large scale, and more neatly kept than many others, but the fruits are no fairer than we saw in other gardens and

in the market. Entering the gate here we see a beautiful circular lawn in front of the dwelling, closely shaven, with a fountain kept constantly playing in the center. There is a smooth, concrete walk, bordered with a great variety of flowers on either side leading to the house. To the left we pass into the fruit garden and orchard. The walks here are bordered with raspberries, gooseberries, red currants, and a native black currant of fine quality. We do not remember ever to have before seen so large gooseberries and raspberries. In a sunny spot is the vegetable garden with all the variety of products usually grown for the table. Further on are the apple and pear trees, and the ground is strewn with the fallen fruit. The apricot trees surprise all beholders. The limbs are bending with the golden fruit, which is now just ripening. There is not a mark of the *Cureulio* or any other insect upon the skin. And this fruit is so abundant that it retails in the markets for a dollar a bushel. Grapes are not always a sure crop here, but last year, though retarded by late frosts, they were likely to ripen. Strawberries grow in the greatest abundance. Some of these trees have a tinge of yellow upon the foliage and look diseased. This is attributed by some to the alkaline soil upon which they are planted. It does not seem to be an indication of disease, for we were informed that often the trees which are yellow one season have abundant fruit the next. Other cultivators rival Mr. Jennings in the quality of their fruit, though few equal him in the exquisite taste of his ornamental grounds. One gentleman informed us that a young apple tree nine inches through at the butt had produced an average of twenty-five bushels annually for three years in succession. He had a peach orchard which had yielded five hundred bushels to the acre. At a public reception given at the city hall there was a display of fruits—peaches, pears, apples, grapes, and apricots—that would have done credit to any horticultural exhibition in the land. Salt Lake City being first settled has finer gardens and orchards than other portions of the territory, but we saw at Ogden, American Fork, the villages in Jordan Valley, and other places, indications of the same careful attention to fruit growing. The houses are embowered in trees, and the trees, especially the apricots, are loaded with fruit.

The Japan Pea.

The Southern seedsmen have advertised and Southern journals have had articles in relation to the Japan Pea. As we make it a point to try all the new things that we can get hold of, we last spring obtained from Mark W. Johnson, dealer in seeds and agricultural implements, Atlanta, Ga., a sample of these peas, among other Southern seeds most courteously furnished. We sowed these peas with twenty-three other kinds of cow or stock peas. Not being aware of their bushy character, we sowed them too near together, and for this reason probably they failed to ripen. This fall we have received a sample of the same pea from L. L. Osment, Cleveland, Tenn., who says they are "unsurpassed for table use." Being in this manner claimed as a garden product we are warranted in the crowded state of the agricultural columns in placing them in the horticultural department of the paper. The seed is about the size of a Daniel O'Rourke pea, irre-

gularly globular, and without the conspicuous scar that marks the attachment to the pod; the surface is shining and of a greenish yellow color. The plant grows to the height of three or four feet, and is hairy in all its parts; it branches freely, and should have space for its proper de-

From the manner in which the pods set upon ours we should judge the yield would be very large. This pea is deserving the attention of cultivators as a fodder crop and for plowing in as a fertilizer. As to what the pea is botanically we are not quite sure; it does not belong

finding a hastate one. This plant grows from 4 to 6 feet high, with square and usually purple stems. The leaves vary considerably in shape; the engraving shows a deeply lobed lower one. The numerous flower spikes are 3 to 6 inches long, and clustered at the top of

THE "JAPAN PEA."

BLUE VERVAIN.—(*Verbena hastata*.)

velopment. The leaves are three-foliolate, upon very long stalks. The flowers are very minute, yellowish, and borne upon axillary racemes, which are sometimes short and again much elongated. The pods, of the shape shown in the engraving, are flattened and two to four-seeded. As to the horticultural value of the pea we are unable to give an opinion, as ours did not become sufficiently matured before frost. Mr. Osment's statement we have quoted above. Mr. Johnson, who sent us the seed, wrote, "not desirable for table use." Remembering to have seen the same thing some years ago in the garden of a friend near Boston we wrote to him for his experience. He writes: "They may be delicious to the celestial palate, but my wife found them hard to cook and I found them hard to eat—never getting soft no matter how long they were boiled." Thus far we think the weight of evidence is against their utility as a table vegetable. As an agricultural crop they are highly promising, at least for localities where the seasons are sufficiently long to mature them. Mr. Johnson speaks highly of the wonderfully prolific character of the pea, and its excellence as a food for stock. It is so much esteemed in some quarters that it has received the rather extravagant name of "Southern Relief Pea." Mr. Osment claims it to have produced 200 bushels to the acre.

to the proper Pea (*Pisum*), but is very near the Chinese Soy Pea, and it is probably a form of that or a closely related species. The Soy Pea (formerly *Soja hispida*, but now *Glycine Soja*) is cultivated in China, Japan, and other parts of the east, and is used to make the sauce called Soy, which was formerly more used than at present. We should be glad to hear in relation to this plant from our friends, especially in the Southern States, who have tried it under circumstances favorable to its proper development.

The Blue Vervain.

In an article upon the garden Verbena, printed on another page, it is stated that we have several native species. They are generally so unlike the cultivated ones in aspect that at first sight one would not suspect them to be closely related, much less to belong to the same genus. Our most common species have their flowers, which are small and not showy, disposed in long and slender spikes, and the plants themselves are mostly erect and robust. The species here figured is *Verbena hastata*; the specific name refers to its halberd-shaped or hastate leaves, but it was unfortunately chosen as leaves of this kind are not a constant character of the plant, and one may sometimes look in vain over a number of plants before

the stem; they are densely covered with small bluish-purple flowers, which gradually open from below upwards. A species considerably resembling this in general appearance is the Nettle-leaved Vervain, *V. urticifolia*, which has more slender spikes with white flowers. Both these plants are very common in waste places, along road-sides, and in neglected fields, and may be regarded as weeds, though not very aggressive ones. The name Verbena is the Latin for some sacred herb, and its application to the plants now known by the name is not obvious. The name Vervain is from the French *Verveine*.

THE AGRICULTURIST STRAWBERRY.—We met this old acquaintance recently at Westport, Ct., in the strawberry field of A. S. Nash. November 3d we picked several stalks loaded with the ripe and green fruit, and many of the vines were in blossom. The vines had been mulched with sea-weed during the summer, and were looking remarkably clean and thrifty. The fruit at this untimely season is probably owing to the remarkable drouth in July, and to the frequent fall rains which the mulch has retained; sea-weed and salt hay take the place of straw as a mulch along the shore and answer equally well. This makes an important saving when straw is worth twenty dollars a ton, as it is at the East the present season,

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Supports for Shovel and Tongs.

The fire-sets as they are sold at the furnishing stores include shovel, tongs, poker, and a stand to hold them. Figure 1 shows one of the common forms of these stands, which is of cast-iron bronzed; others are made more costly in style and material, but essentially similar in form. The base is made heavy enough to prevent the affair from overturning readily, and is usually dished on the upper side to hold the ashes that may drop from the irons as they are set up in place. Such an affair is not only a help to neatness, but is convenient in keeping the utensils always in one place. For an open wood-fire a similar convenience can be made in rustic work, as shown in figure 2, by any one who is ingenious in making such things. In a support of this kind the base should be made as a shallow box to contain stones or pieces of old

Fig. 1.—IRON SUPPORT.

Fig. 2.—RUSTIC SUPPORT.

iron in order to give sufficient weight and stability. The base may be stained with umber and varnished, or covered with oil-cloth with a piece of zinc upon the upper side for the irons to rest upon.

Home Topics.

BY FAITH ROCHESTER.

ANOTHER RECIPE-BOOK.—This time it is the work of that great luminary in the realm of gastronomy, Professor Pierre Blot himself! The book is entitled "What to Eat and How to Cook it." I was delighted to get hold of this book at last, and expected to learn much from it. I am glad to have looked it through, and to have gained

a clearer idea of what it does *not* teach as well as of what it does.

I read the preface first, as is my custom, and was pleased to hear Professor Blot say that "no matter how inexperienced some of our housekeeping readers may be, by carefully following our directions they will be able to live as well and as economically as possible, and also serve a dinner in as orderly a manner as any steward could do." Is not that promising a great deal?

I was amused also to have him add: "It will not only be easy to order a suitable dinner at all times, but also a breakfast, lunch, or supper; any housekeeper may superintend her culinary department and direct her cook, making proper observations whenever necessary without the least trouble."

"Without the least trouble!" "Any housekeeper!" Only think what a godsend such a book must be. But Professor Blot never even thought of the various complications of American housekeeping, of the inadequate contrivances and appliances of most of our kitchens, of the poor and unreliable quality of our hired kitchen service; and how *could* he have the most faint idea of the nerve strain which a modern mother of young children suffers who earnestly tries to steer between the Scylla and Charybdis of a poorly regulated *cuisine* and neglect in the department of child culture?

That well-meaning French missionary to American heathen only directs the preparation of a meal. His assistant, a skilled French cook, carries out his directions, with the aid of a scullion to do all the rougher work of preparation and cleaning up. So, my sister American housekeepers, we must let the worthy Professor go on groaning over our barbaric food and habits of cooking until we too can have our French cooks and scullions—to say nothing of the indispensable parsley and bay-leaf that go into nearly every dish concocted by him. Gail Hamilton says (and she was one of his pupils a few years ago when he lectured in Eastern cities) that "Professor Blot puts broth into everything." It would be easier for some of us to find or make the broth than the parsley, it seems. I have inquired diligently in a Western city of over 30,000 inhabitants for parsley in some form, but without success so far. I do not wish to say that it can not be found here, and that such a large body of American citizens are deprived of its saving virtue, for it may only be the case that I have not yet found the corner where it is kept. I particularly wished to learn all about seasonings from Professor Blot, but I have not been enlightened to the extent I desired. He says: "Seasoning is the most difficult part in the art of cooking: to be able to judge what kind of spices can be used to season such and such a dish; to what extent all the spices used agree together, and what taste and flavors they will give the object with which they are cooked; for if not properly used they may just as likely destroy the taste and flavor of the object as improve it. Some dishes require high and much seasonings, others just the contrary. With a good fire and a good spit it is not necessary to be a cook to roast a piece well, but the cook is indispensable to mix the gravy or sauce with the proper seasonings." Then why could not Professor Blot have told us distinctly just what seasonings do take kindly to each other in all cases?

Masculine critics have a way of supposing that the inferior cooking done in our private kitchens is owing chiefly to our lack of exactness in following our recipes. They can not realize how difficult it is for many of us to have constantly on hand such a variety of materials as Professor Blot directs for nearly all his dishes. It does not occur to them that scarcely one housekeeper in a hundred has suitable scales and measures for accurate measurement, and nine mothers out of ten (at present the housekeepers are usually mothers) can not think of weighing out their ounces and half pounds of butter and sugar with babies pulling at their gowns, while it is so much easier to toss into the mess that is to be mixed or cooked "a piece of butter as big as a lump of chalk" or "as much as you would get on the table at one time." The cooks must be free from child care and the mothers from

housekeeping before ever cookery or child nurture can be properly carried on.

Professor Blot never uses savory for seasoning. He utters his protest against it, and says that other excellent cooks agree with him. I saw no mention of marjoram in his book, which Hepzibah Brown had not read before Mr. Hale wrote the story of her Christmas turkeys, I presume. She insisted that all of her turkeys should be stuffed with pounded cracker and marjoram. You will find over and over in Professor Blot's recipes this combination: "a sprig of parsley, one of thyme, a bay-leaf," probably "one or two white onions with a clove stuck in each," and very likely "a clove of garlic" and two or four leeks in addition. I do not doubt that it is of the greatest importance to use seasonings in proper combinations when they are used at all, but it is quite possible to cook well and omit these spices altogether if the materials are good and wholesome in themselves.

Since reading Professor Blot's book I perceive that I am much more interested in cookery as a science than as an art; not because I despise the art, but because I distrust all art that has not a firm basis of true science. I can not believe that our physical culture (and all our higher culture depends upon physical culture as a basis) demands that more attention be given to the pleasing of the palate by the mingling of spices and flavors than to the selection of wholesome materials, such use of heat and water, etc., in the cooking as makes the object cooked yield its own best flavors and its greatest nutriment to our requirements, and the judicious selection of such variety and combinations of food at each meal as tends most to keep our bodies in health and our souls untroubled by our bodies' complaints. It is highly important that food should be made palatable as well as nourishing. The stomach refuses to do its best work in helping to make good blood of food, if that food comes into the stomach unrecommended by the nerves of taste. But there are flavors most delicate and delicious stored away in the fruits and vegetables and meats and grains themselves, "each after its kind," and a sort of culinary injustice is done, it seems to me, when the cooking is in carelessness of those flavors and the main dependence placed upon combinations of spices. However, I don't know much about it, I am free to confess; but at present my hope for a true art of cookery turns more toward earnest investigating physiologists and experimenters in vital chemistry than to the conventional decrees of French "artists" in gastronomy.

A GOOD BOOK FOR PARENTS.—I have been earnestly requested by a friend to send her immediate notice of any book I find or hear of which will help her to understand her children's needs and her own motherly duties toward them. So, while I was lately reading Herbert Spenser's work on "Education," I kept longing for a chance to talk over its suggestions with my friend. I commend this excellent book to every thoughtful parent. It comprises four lengthy essays, previously published in English magazines, upon the following topics: What knowledge is of most worth; Intellectual Education; Moral Education; Physical Education. I was surprised and delighted to find the whole so plain and so practical, and so particularly adapted to parents. I do not like to own books and have the care of them (except a few for very frequent reference) unless I can have the privilege of lending them to those who appreciate them; but this is one of the books that I must surely buy and write my name in and keep circulating as fast as possible. I took it from a public library, where other good things are in store for me. Bless the public libraries!

THE LITTLE PAINT BOXES.—Our little boy had a fifteen-cent paint-box when he was about three years old, and took some pleasure in its use, but the colors were soon scattered and lost. When a new book—"Reading without Tears"—was brought home for his use, some time in September, I promised him some new paints as soon as he had read through the first part of the book. His

progress in reading was all that I could reasonably require, but I grew tired of waiting for the new paints. I grew ashamed too of holding out any such motive for the reading lessons, since the little fellow was really desirous of learning to read, and I was unwilling to have him read when he was tired or unwell or very much interested in other things. So I asked to have three good cakes of water-colors brought home—the three primary colors, red, blue, and yellow. When papa gave them to me he said: "I wonder if I have not done a foolish thing in buying just three small colors at twenty-five cents apiece. I had several paint-boxes in my childhood, and took a great deal of pleasure with them, but all together did not cost so much as these three colors."

I had some doubts myself, and do not feel sure now that our course was the best under all circumstances, but it does not seem to have been bad. A fifteen-cent box of colors was bought for the little sister at the same time. When I showed the children these treasures next day I think they both thought the cheap box preferable because there were more colors. But after I had found them some prints to color, I took a broken dinner plate for a palette and showed the little boy what a variety of colors we could make from his three primary colors. With blue and yellow we made green, more or less yellowish or bluish. With red and yellow we made orange, and with red and blue we made purple. Then we united the three colors in different proportions and made various browns and grays. This done, I laid the nice cakes of color away, leaving him colors enough on the plate to last a day or two. I taught him to put the colors on thin (or with considerable water) so as to show the shading of the engraving through the color. Our old *Agriculturists* are growing gay under the little brushes and colors, and the children have decided now that when they grow up they will be artists! Every afternoon (with some unavoidable exceptions) they spend an hour or two—all the time that they can get between the wiping of the dinner dishes and "chore time"—in the happiest employment of the day, painting. For a few days baby patiently tried to satisfy her longings after art by assuring herself, "Whou I get bigger I may paint too," but she didn't get bigger fast enough, and at last she would keep shoving a chair to the table, climbing up, and meddling with the colors and with the water cups. So now she has an old saucer with some gay color ground off upon it, a piece of newspaper to daub, and one of mamma's old long-handled oil-paint brushes to work with.

I have a chance to watch the development of art in various stages. Miss Two-Years delights most in making pretty-colored water in her little cup by frequent rinsing of the brush. Miss Four-Years likes to put bright colors on the pictures, without much regard to fitness or much care about outlines. The boy of seven years tries, in his way, to match the colors of nature and to put the colors on so as to improve the picture. The improvement is sometimes doubtful, but of course I never say so.

DRAWING AND PAINTING.—I feel pretty sure that coloring comes naturally before outlining, but I do not know of any systems of art culture where this course is followed. I had felt that the kindergarten course is wrong somehow in its drawing lessons, for I do not believe that any children will naturally take pleasure in practicing on little straight, unmeaning lines. I was delighted to find that Herbert Spencer had thought the same before me. He thinks that the use of colors should be allowed children, the coloring of pictures already outlined and shaded, as in prints, before any attempt is made to teach drawing. I see now that the desire to sketch pictures of his own to color begins to crop out in our little boy, and one or two ludicrous attempts have been made, with great pleasure to the young artist. I made a few efforts some time ago to interest him in the kindergarten drawing lessons, but it was tiresome to us both, and I concluded that the painting which he did enjoy was better practice in that very direction of drawing than such arbitrary making of unmeaning lines.

MOLASSES CAKE.—Marion Harland gives a recipe for *Sponge Gingerbread without Eggs*, which gives good satisfaction to those who try it:

"Five cups of flour; one heaping table-spoonful butter; one cup molasses; one cup sugar; one cup milk (sour is best); two tea-spoonfuls saleratus, not soda, dissolved in hot water; two tea-spoonfuls ginger; one tea-spoonful cinnamon. Mix the molasses, sugar, butter, and spice together; warm them slightly, and beat until they are lighter in color by several degrees than when you began. Add the milk, then the soda, and, having mixed all well, put in the flour. Beat very hard five minutes, and bake in broad shallow pans or in *pâté*-tins. Half a pound of seeded raisins cut in pieces will be a pleasant addition."

This recipe is given exactly as in "Common Sense." We are told that "sour milk is best." It must be decidedly better than sweet milk when so much alkali is used. With sweet milk alone what becomes of all that saleratus? There is an acid in the molasses, and soda mixed with it sets it foaming; but two tea-spoonfuls of alkali seem quite too much for one cup of molasses. The soda which is not met and neutralized by the proper amount of acid must unite with the grease in the combination to produce soap. I have been treated to molasses cake before now which was more suggestive of soap than of anything else. Soapy biscuit is also manufactured by some cooks who disregard the laws of chemistry. I have made this sponge gingerbread with sweet milk, adding a small table-spoonful of vinegar to the other ingredients. I always use soda, in spite of the prohibition.

What Shall we Have for Breakfast?

[Last month it was stated that we should publish several of the responses to the above question, and we begin with giving that of Mrs. Anna Tauner of Louisiana. Others will appear in due time, as space will allow.—Ed.]

SUNDAY.—Cold ham or tongue. Stewed oysters. Boiled eggs. Cold light bread, brown bread, and warm light rolls. **MONDAY.**—Ham and eggs (fried). Small hominy or grits. Waffles. Corn-batter cakes. **TUESDAY.**—Beefsteak with gravy. Lye corn. Muffins. Toast. **WEDNESDAY.**—Broiled mutton chops. Biscuit; puffs (or fried biscuit). Omelet. Cold mush fried. Toasted cheese. **THURSDAY.**—Fried chicken and boiled rice. Fritters; buckwheat or rye batter-cakes. **FRIDAY.**—Sausages. Large hominy. Fried sweet-potatoes. Sally Lunn. Corn griddle-cakes. **SATURDAY.**—Hash, dry or with gravy. Fried oysters. Cold potatoes, mashed and made into fritters. Gems; pancakes; corn-bread.

Coffee, butter, and molasses at every meal. Milk and chocolate when convenient.

In the summer-time I always have curd or cottage cheese, melons and whatever fruit is in season.

Mrs. Tauner proceeds to give recipes of the less known dishes mentioned above, as follows:

FRIED CHICKEN is the best breakfast dish I know of, and can be quickly prepared if the chicken is picked and cleaned the night before. Rice always accompanies chicken in Louisiana.

FRIED SWEET-POTATOES.—The evening before they are wanted peel and slice them, lay them in a stew-pan and sprinkle sugar between the layers of potatoes; pour on water enough to cover them, and set the stew-pan on the stove. In the morning, by the time you are ready to fry them, they will be cooked just enough; fry in hot lard to a light brown on both sides.

LYE-CORN is made by boiling corn with sifted wood-ashes until the outer skin or "husk," as we call it "down South," easily slips from the grain. Then it is cleansed of all impurities. Put into a kettle and boil all day, changing the water frequently. The fresh water added should always be warm. When quite done pound well with a wooden pestle. I generally have enough made to last a week in cold weather. When wanted for use, take

about a quart of the corn, put it in a stew-pan with half a pint of sweet milk; salt and pepper to your taste. Set it to simmer until wanted. Just before serving add two well-beaten eggs stirred in briskly. [This is called Hulled Corn in New England.—Ed.]

CORN-BREAD.—Pour over a quart of sifted meal a very little hot water; if scalded too much the bread will certainly be clammy. Add to it four well-beaten eggs and half a tea-spoonful of soda dissolved in warm water. The whole thinned to a soft batter with clabber or buttermilk. Have your pan very hot; put into it a piece of lard the size of a walnut; as soon as it melts pour in your batter and bake.

BATTER CAKES.—Take half a pint of sifted meal and make a mush of it; thin the mush with half a pint of sweet milk; add two eggs and flour enough to make the cakes turn.

In speaking of the difficulty of finding a servant who will have breakfast by daylight on a wintery morning, and the necessity of doing it herself, Mrs. T. evidently intends her remarks for the editor only, but the following is so sensible that we trust she will excuse us for publishing it:

"I do not like to cook, nor am I a capital house-keeper. But there is one thing I can do well, that is, submit with cheerful grace to whatever is inevitable. It is not so much over-work that wears a woman's life away as constant fretting about distasteful work. Life is too short not to accept with a thankful heart the blessings, be they many or few, that fall to our lot."

Renovating Old Feathers.—Mrs. C. L., of South Carolina, sends her method of treating old feathers, as follows: Expose them to the sun in an old mosquito net (or coarse corn sacks will answer) until perfectly dry, shaking them up from time to time. To get out the dust, they must be tied up to some convenient place in the yard and well beaten up with the hands or a stick (the person standing to windward, of course). If a lace net is used, feathers may be as thoroughly dried and sifted in this as can be desired.

Cake-Making.

Every lady thinks her way of making cake is the best. We give here what Mrs. H. B. P., a New Jersey lady, thinks is the best:

In reading your May number of the *Agriculturist* I see some very good advice from Faith Rochester about making cake, but I think she might have improved the making of the cake had she told us to add the soda the last thing instead of the whites of the eggs. This I think the secret of having light cake. Beat the sugar and eggs as she says; in putting in the milk save out a great spoonful to dissolve the soda in; then get the cake all ready for the oven; have your baking-tins all ready; then put the soda in, stirring it as quickly as possible, and put it into the oven just as soon as you can do so; the heat will be acting at the same time with the soda and cream-of-tartar. I think one that has never tried this way of doing will be surprised to see the difference it will make in lightness of the cake.

TEA CAKE.—One cup of sugar; one great spoonful of butter; half cup of milk; two cups of sifted flour; a very little nutmeg; one tea-spoonful of cream-of-tartar; half a tea-spoonful of soda.

MOUNTAIN CAKE.—One cup butter; three cups of white sugar; four of flour; five eggs, whites beaten separately; one tea-spoonful of cream-of-tartar; one of soda dissolved in the milk.

FRUIT CAKE WITHOUT EGGS.—Two-thirds of a cup of butter; two cups of sugar; two cups of raisins; two cups of currants; two cups of sweet milk; two tea-spoonfuls of cream-of-tartar; one of soda in the milk; six cups of flour; one nutmeg; one table-spoonful cinnamon, allspice, cloves, each; half pound of citron improves it. Bake slowly.

BOYS & GIRLS' COLUMNS.

A Beautiful and Curious Stone.

Do you recollect that in speaking of the different forms of limestone in November last, I said, "In some limestone regions crystals are found, some of which are as transparent as glass?" This most beautiful kind of limestone is found in the greatest perfection in Iceland, and it is called Iceland spar wherever it may be found. Our neighbors, Rohbeck and Goebler, dealers in chemical articles, No. 4 Murray street, bought the finest specimen

Fig. 1.—DOUBLE REFRACTION.

that was sent from Iceland to the great Vienna exhibition. It was something like a foot long and about four inches thick, and "as clear as a crystal." The shape of this crystal is a rhomb (which you must look in your dictionary for), and when broken—it breaks very easily—all the pieces, however small, are rhombs. Is not it strange that this crystal, so perfectly transparent, should be just the same thing as limestone or marble? "Look through it?" Yes, you can not only see through it, but you can see double. If you place it over a line on a paper you will see two lines, and if over a word two words will appear as in figure 1. This is called double refraction. This makes it necessary to explain refraction, which means bending. When light passes through the air it goes in straight lines; if it passes from the air through glass or through water it is refracted, or bent

Fig. 2.—REFRACTION IN WATER.

out of the straight line. You have no doubt noticed that a straight stick placed partly in the water appears as if bent at the surface, and you have seen how curiously out of shape things look when seen across a hot stove, the light going through the air, made thin by the heat of the stove, gets bent or refracted. In fig. 2 is shown a knife upon which is placed a coin and immersed in a glass of water; the knife appears bent as shown by the dotted lines. This is simple refraction, of which you may see cases frequently. Now the Iceland spar and some other minerals possess the remarkable power of doubly refracting. The light in passing through it is split into two parts, which are separated by the crystal, and in looking through it we see two things instead of one. This property which this crystal has of splitting up light in this way has enabled men to learn much more about light than they would otherwise have known, and I hope that when you get old enough you will read about the wonderful discoveries this has led to.

THE DOCTOR.

How Business is Done Under the Sea.

Every boy and girl knows that there are several telegraphic cables between this country and Europe, and that we are able to read in our evening papers what was done in London and Paris during the day. There are also many business messages sent as well as those relating to private and family matters. Just think of that bundle of slender wires surrounded by gutta-percha called the cable. How it rests upon the sea bottom, far, far down below the waves and storms; how

it lies in low valleys and hangs over mountain peaks, from the bottom of the ocean is as rugged as the land. Just think how wonderful it is that news of wars, news of banks and markets and news of deaths and births, of safe arrivals and of losses at sea, can be sent along this wire for thousands of miles and travel faster than the time kept by the sun. It costs much to lay these wires, and much to keep them at work; hence those who use them have to pay a large sum for sending messages. At one time it cost £1, or \$5 a word, but it is very much cheaper now, but not so cheap that it is not necessary for those who use it much to arrange plans to make the words as few as possible.

Merchants doing business devise what they call a telegraphic code. Let us suppose that you are doing business in London and that we are upon this side and that we are engaged in selling cotton. We agree by letter that certain words to which each has the key shall mean certain things. For instance, "Box six" we have agreed shall mean "cotton is higher, do not sell," and so on. We can give you an idea of a code actually in use. A large seed establishment furnishes its dealers with its code. Each principal variety of seed is represented by a short word and the pounds or bushels by letters—thus A. B. C. D. stand for 5, 10, 15, 20 lbs, or 1, 2, 3, 4 bushels and so on.

McLean's Advancer Pea is represented by Smith, so a dealer instead of telegraphing "Please send me one hundred and twenty-five bushels of McLean's Advancer Pea," simply telegraphs "T. L. E. Smith." The clerk who receives this by looking at the printed code sees at once what is wanted. Counting each letter as a word we have only four to express the whole order which in the usual way would require fifteen words, and as such messages are charged so much a word a great saving is made. Other kinds of business have similar codes.

About "English Currants."

Wyna, aged 11, is a girl whom I like. I never saw her, but she "wants to know," and that is why I like her. She has seen English currants used in cake and other cookery, and noticing that they were not like the currants that grow in the garden, she wishes to know more about them. Being unable to get the information elsewhere, she comes to the old doctor with the questions, "Where do English currants come from? how do they grow? and how cured?" In the first place, English currants are so called because they are neither "English" nor "currants." This is not a very promising start, but let me explain. In "old times" most foreign things came to this country by the way of England, and the name English was given to things that came from other parts of Europe. For some of these things the name is kept to the present time—thus the grocers keep English walnuts and English currants, and the painters use English vermilion, and some farmers sell English hay. The "English" currants come from Greece; and as they were sent from Corinth, they were in former times called Corinths, and it was the easiest thing in the world to say Corinths, Corinths, Currants. So much for the name. Now, what are they? They are small, imperfect, seedless grapes, not just like the grape that we have, but the European grape, such as raisins are made out of, and such as you see sometimes imported fresh in sawdust. For some reason or other, the grape which is so fine in other parts of Europe has degenerated in parts of Greece; it has no seeds, and remains very small, and when dried in the sun makes the currants. It is said that sometimes bunches come on the vine, the grapes on which have seeds in them, and grow to be good-sized berries, and no longer of use as currants. It is also said that the vines which produce these poor little currant-like grapes, when taken to other countries, no longer bear the little berries, but go back to the original state. So you see "English currants" are really very poor grapes from Greece. Now I wish all the boys and girls to follow the example of Wyna, and when they get "puzzled" about such things, as she says she was, to ask their friend, THE DOCTOR.

Aunt Sue's Puzzle-Box.

NUMERICAL ENIGMAS.

1. I am composed of sixteen letters. My 3, 15, 1 is often sought by laborers. My 1, 4, 5, 6 is a half statue. My 10, 12, 14 is a Sabbath-day cooler. My 5, 16, 7, 8, 9, 12, 13, 9 is an ensign. My 3, 2, 11, 13 is to scoff. My whole is a good maxim.

W. E. H.

2. I am composed of twelve letters. My 8, 9, 10, 11, 12 may be seen on a house. My 1, 4, 6, 3 is a relative. My 5, 2, 7, 11 is an animal. My whole come in the fall of the year.

AMANDA VELSOR.

CROSS-WORDS.

1. My first is in lamb but not in sheep. My next is in wake but not in sleep. My third is in study but not in play. My fourth is in March but not in May. My fifth is in taste but not in smell. My whole is a name not hard to spell.
HATTIE KETCHUM.
2. My first is in sirloin but not in chop. My next is in dandy but not in fop. My third is in Tom but not in Bill. My fourth is in luck but not in skill. My fifth is in verb but not in noun. My sixth is in village but not in town. And now if the letters right you will take, The name of a gentleman they will make.
MINNIE.

AUNT SUE'S NOTICES TO CORRESPONDENTS.

Thanks for letters, puzzles, etc., to W. E. H., Jr., L. N., Fred S., J. T. D., Ellen, and Emma W. A. AUNT SUE'S address is Post-Office Box 111, Brooklyn, N. Y. Some time ago some one asked me how to press flowers for making floral ornaments. I wrote an answer to

the question, but owing to the rush of rivers that month my notice was crowded out. Perhaps "better late than never" will apply in this case. Spread a thin layer of raw cotton upon a sheet of note-paper. Upon this place your flower, which must then be flattened with the fingers, arranging it gracefully into shape. Draw carefully between the petals, where they touch each other, "the least little bit" of raw cotton. Place another thin layer of cotton over the whole, then put the *flower sandwich* between the leaves of a book, and leave it, for not less than a week, under a heavy weight. At the end of that time you may take off the cotton, and with a needle carefully withdraw the fibers of cotton from between the leaves. Should you wish to preserve the flowers in their original shape lay them (where they will not touch each other) in a box one-eighth full of fine, white, clean sand which has been thoroughly dried in an oven. Then gently dust sand over them until they are entirely covered. Place the box in the hot sun (or in a moderately warm oven for two or three nights). When you wish to remove them from the box lift it so as to let the sand run off very gradually until the flower is released. Some flowers preserve their color and shape wonderfully well under this treatment, and may be made up into bouquets which will last all the winter. The flowers must be quite dry when taken out of the box or they will not keep. Some may take a week or two before it will be safe to disturb them.

with the fine brick and brown-stone houses of the wealthy. To every shanty belong numerous children, several dogs, and one or more goats, not to mention the grown people, and it may be conceived that a neighborhood of them

account of his troubles with that goat, which he said, "had barked everything upon the place except the crow-bar." The goat takes especial delight in barking trees, as many a one who has planted trees in front of his house and has delayed in getting tree-boxes knows to his sorrow; perhaps the next best thing to a goat's mind to spoiling trees is despoiling shrubs. The rascals wait until the little city front-yard is nicely put in order with flowering shrubs and vines, and then when in an unguarded moment the gate is left open the demolition is accomplished in short order. If no green thing can be had the goats content themselves with paper and cloth. We have seen posters and placards stripped from a fence as high up as they could reach by standing on their hind legs, and if a washing is left unguarded upon the line the sheets and tablecloths will be found in a sad plight. The green-grocers, who are very apt to set their vegetables and fruit upon the sidewalk, have to keep a special lookout for their property or a sudden attack may bring them to grief, and many a workman upon the streets who has put his dinner kettle in what he thought was a safe place, has been unintentionally providing a meal for these street Arabs. We sometimes see a pair of goats in a fine harness drawing an elegant little coach which contains some rich man's son. These goats are for the most part trained by the poor boys of the shanties, and begin their education in a harness made of odds and ends of twine, ropes and leather, and are attached to a rude wagon made of a box. After the goats have done all the mischief they can think of for one day they must rest, and for this purpose they select the finest and sunniest door step, where they take their

TROUBLE FOR THE LAUNDRESS.

is not especially pleasant. As the goats often run loose in spite of law they are a source of no little annoyance to the whole vicinity. The monkey is regarded as the most mischievous of animals and perhaps he is, but the goat is not much his inferior, and goats are common while monkeys are not. Goats are kept for their milk, which

and begin their education in a harness made of odds and ends of twine, ropes and leather, and are attached to a rude wagon made of a box. After the goats have done all the mischief they can think of for one day they must rest, and for this purpose they select the finest and sunniest door step, where they take their

A Piece about Goats.

Goats, in this country at least, are mostly to be found in towns and cities, and as they for most part are the

TAKING HIM IN.

sons, are not occupied by their owners but are usually thickly covered with shanties. It is not a rare thing to find a "huddle" of these shanties, built of old lumber, packing-boxes, and every conceivable material, occupying land upon a street which in another part is built up

saw a goat partaking of these delicacies, but should not be at all surprised to see one at it. A number of years ago Horace Greeley had a goat upon his farm for the purpose of furnishing milk for a weak child. He wrote to the *Agriculturist* a very funny

of his own on the subject. Besides these collections of shanties turn out a great many voters, and it sometimes is the case magistrates do not care to gain their ill-will by enforcing a law that is unpopular with such a large number of their constituents.

Life Insurance.

INSURANCE differs from other business pursuits only in that it protects each individual of the community from the overwhelming consequences of a possible calamity to which he, in common with others, is exposed, by collecting, conserving, and disbursing the contributions of the many for that purpose; and in this sense it is an eleemosynary institution.

Tried by this standard, it will be found that the business of insurance does differ materially from other pursuits; that it is almost sui generis; that it does "perform a great charity," and performs it all the better because it performs it as a business, on business principles, and with the sagacity that is always exhibited in matters of profit and loss; in fine, that it is hardly less indispensable to civilization and material progress than is government itself.

If we turn to life insurance, the force of these considerations will be even more apparent. Life insurance not only "performs a great charity," but is a great charity—perhaps the greatest that has ever been conceived by man. Over hundreds of thousands of homes, which were else left at the mercy of the great destroyer, it extends its beneficent protection, and, in the hour of deepest bitterness, pours out a sympathy that is metallic; and if it can not replace the lost husband and father, preserves to the bereaved the home which his hands had earned and his love bestowed. Who shall attempt to measure the influence for good of this greatest of all the charities? What misery and want, what desperation and crime, so largely the results of poverty, are thereby prevented.

But life insurance, for this very reason, is a business which depends more than others upon the confidence of the community; and the companies who best deserve that confidence will be the successful companies of the future. Among these the United States Life Insurance Co. of this city is conspicuous; and in addition to the many other proofs of honest dealing and thorough solvency which it has so often given, the appearance of its annual statement for 1873, on the morning of January 1st, 1874, is a further earnest of its good faith. This is a punctuality never before attempted, much less attained. The statement has been verified by us so far as to show that, of the assets therein reported, every dollar, except the relatively insignificant sum of \$25,000, was in possession of the company at the time of making the statement. This is unprecedented in the history of life insurance, and shows that the managers of the United States Life deserve to succeed, if fidelity to their trust and considerate recognition of the claims of the public deserve success.

(CIRCULAR.)

Consumers Importing Tea Co., No. 8 Church Street, P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers Importing Tea Co., No. 8 Church Street, P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D. C.

GLASS CUTTERS

Our Glass Cutters are made with a handle like a Glazier's Diamond, but instead of the diamond point, they have a small hardened Steel revolving wheel, the sharp edge of which cuts nearly as well as a diamond. They are durable, and will give entire satisfaction. Most Hardware Dealers keep them, or will send to us for them if wanted. Where they are not for sale, we will send one by mail, prepaid, on receipt of thirty-five cents.

We will send one to any publisher who will insert this notice and forward us a copy prepaid. MILLERS FALLS COMPANY, No. 78 Beekman Street, New York.

THE ATLANTIC for 1874

Begins its thirty-third volume under the most prosperous auspices. The new publishers will spare no pains to keep it the LEADING AMERICAN MAGAZINE, containing the fresh writings of

LONGFELLOW, WHITTIER, HOLMES, LOWELL, HOWELL, BAYARD TAYLOR, ALDRICH, WALNER, WELLS, PARTON, OWEN, EGGLESTON, with able criticisms upon current literature, art, and science.

PRUDENCE PALFREY

is the title of the novel begun in the January number by that witty writer, THOMAS BAILLY ALDRICH.

Personal Reminiscences, by the Poet WHITTIER, will cover an eventful period in our history, and the volume promises to be an UNUSUALLY BRILLIANT ONE.

TERMS.—Single or specimen numbers, 35 cents. Yearly subscription, \$4.00. The Atlantic and Every Saturday (\$3.00) sent to one address for \$8.00. Address the publishers,

H. O. HOUGHTON & CO., Boston. HURD & HOUGHTON, New York.

Automatic PUMPS. Water driven to any height and distance by compressed air. Country houses supplied cheaply and certainly for bath-rooms, water closets, hot and cold water faucets, etc. Plenty of fresh water for stock on farms. Address HARTFORD PUMP CO., 41 Trumbull St., Hartford, Conn.

R. D. HAWLEY'S

Annual Illustrated Catalogue of Fresh and Genuine Wethersfield (Conn.) Garden and Farm Seeds for spring of 1874 will be ready early in January to send free to all applicants.

Choice Stock. Moderate rates. Prompt delivery.

Address **R. D. HAWLEY,** Seed and Agricultural Warehouse, Hartford, Conn.

My business is to supply what every farmer of experience is most anxious to get, perfectly reliable Vegetable and Flower Seed. With this object in view, beside importing many varieties from reliable growers in France, England, and Germany, I grow a hundred and fifty kinds of vegetable seed on my four seed farms, right under my own eye. Around all of these I throw the protection of the three warrants of my Catalogue. Of new vegetables I make a specialty, having been the first to introduce the Hubbard and Marblehead Squashes, the Marblehead Cabbage, and a score of others. My Catalogue, containing numerous fine engravings, taken from photographs, sent free to all.

JAMES J. H. GREGORY, Marblehead, Mass.

A M A C R I. PAT. DEPT.

IMPORTANT TO INVENTORS. American Agriculturist PATENT DEPARTMENT

In compliance with the request of numerous inventors, we have organized a

PATENT DEPARTMENT in connection with this office for the transaction of all business connected with

Securing Patents in the United States and foreign countries.

The character for **Reliability**

which has been maintained by the AMERICAN AGRICULTURIST for more than thirty years will be carefully guarded in this as in other departments.

All Inventors

desirous of procuring patents at moderate cost are invited to forward (express prepaid) a model of their invention, with a brief description of its working. The model should not exceed one cubic foot in dimension. Upon receipt of model an opinion as to patentability will be given free of charge.

Preliminary Examination

at the Patent Office, to determine patentability, will be promptly made for a fee of \$5.

Litigation of Patents.

The services of the best counsel have been secured to prosecute or protect before the U. S. Courts and the Patent Office the claims of those intrusting their business to this agency.

Specifications, drawings, engravings, models, and all other appliances furnished at moderate prices.

In all dealings with this Department inventors may depend upon promptness, fidelity to their interests, and the best services which can be rendered by thorough experts. For full particulars, address

AMERICAN AGRICULTURIST PATENT DEPARTMENT, ORANGE JUDD COMPANY, 245 Broadway, New York.

ADVERTISING RATES.

ORANGE JUDD COMPANY, 245 BROADWAY NEW YORK.

AMERICAN AGRICULTURIST.

ORANGE JUDD COMPANY, Publishers, 245 Broadway, N. Y. ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each: Ten to nineteen copies, \$1.20 each: Twenty copies and upward, \$1 each. Papers are addressed to each name. Either English or German Edition, at these prices. HEARTH AND HOME: \$3 a year for less than four. Four to nine copies, \$2.75 each; 10 or more copies, \$2.50 each. Hearth and Home (weekly) with American Agriculturist sent to one address for \$4 a year.

raising a club much larger than you had at first calculated upon; and even should you secure fewer subscribers than at first hoped for, the Premiums are so many and so various that you could not fail to be suited with some good thing on the list.

Persons of all classes have engaged successfully in the work, and very many have materially increased their income, and that too without encroaching upon their ordinary working hours and with but little trouble to themselves. The articles offered as Premiums are worth the regular price which is set against them. They are new and good. They have almost universally pleased and satisfied the recipient. You can obtain one or more of them.

TRY IT.

The American Agriculturist is everywhere known and approved. HEARTH AND HOME issued every week, with the Best Original Stories, contributions on Live Topics, a capital Household Department, and a most interesting Department for Children and Youth, should be in every home in America. The papers are entirely different. Taken together, they supply more good reading than can be found in fifty books costing one Dollar each.

Premium Clubs can be made up of subscribers to either paper, or partly of one and partly of the other, as noted over the Table. We call especial attention to the last column of figures, showing the small number of names required where both papers are taken, at the reduced price of \$4 a year.

You, Reader, can get a Premium. TRY IT.

Explanatory Notes.

N. B.

Read and carefully

Note the following items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But... (b) Tell us with each name or list of names sent, that it is for a premium... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have any time, from now until July 1st, to fill up your list... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers... (f) Specimen Numbers, etc., will be supplied free as needed by canvassers, but they should be used carefully and economically, and where they will tell... (g) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd Company, or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk; otherwise it is not.

In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 a year for American Agriculturist, and \$3.00 a year for Hearth and Home; also at the club rates of \$1 and \$2.50; also at the rates of \$4 a year for both papers together. Description of Premiums sent free to applicants.

N. B.—In all Premium Clubs for either paper, TWO copies of American Agriculturist (English or German) at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the 2d and 4th columns, or from the 3rd and 5th, or wholly from the 6th column.

Table of Premiums and Terms For American Agriculturist, and for Hearth and Home, for the Year 1874.

Open to all—No Competition.

Table with 6 columns: No., Names of Premium Articles, Price of Premiums, American Agriculturist (only), Hearth and Home (only), Both Papers (together). Rows include items like Moore's Floral Set, Gold Pen, Gold Pen and Silver Case, Gold Pen, Handle gold-tipped, Ladies' Gold Pen and Rubber Case, Paragon Pen, Revolving Pencil, Paragon Pen, Revolving Pencil, Payson's Indelible Ink, Cake Basket, Revolving Butter Cooler, Card Receiver, One Dozen Teaspoons, One Dozen Tablespoons, One Dozen Table Forks, Child's Cup, Child's Knife, Fork & Spoon, Child's Carriage, Child's Self-operating Sewing, Doll's Cottage Chamber Set, Crandall's Building Blocks, Crandall's Masquerade Blocks, Knives and Forks, Knives and Forks, Knives and Forks, Carver and Fork, French Cook's Knife, Fork, and Steel, Pocket Knife, Pocket Knife, Ladies' Pocket Knife, Mitten in Parvo Knife, Garden Seeds, Extra Early Vermont Potato, Sewing Machine, Grocer & Baker, Sewing Machine, Florence, Sewing Machine, Willcox & Gibbs, Sewing Machine, Secor, Beekwith \$12 Sewing Machine, Beekwith Portable Family Sewing Machine, Washing Machine, Clothes Wringer, Melodeon, 4-octave, Melodeon, 5-octave, Piano, Siantia Tacet, Silver Watch, American Watch Co., Ladies' Fine Gold Watch, Breech-loading Pocket Rifle, Double-bbl. XVI to XXXII, Any Back Vol. Agriculturist, Any Two Back Volumes do, Any Three do, Any Four do, Any Five do, Any Six do, Any Seven do, Any Eight do, Any Nine do, Farmer's Boy's Library, Any Back Vol. Agriculturist, Any Two Back Volumes do, Any Three do, Any Four do, Any Five do, Any Six do, Any Seven do, Any Eight do, Any Nine do, Any \$10 Library, Any \$15 Library, Any \$20 Library, Any \$25 Library, Any \$30 Library, Any \$35 Library, Any \$40 Library, Any \$45 Library, Any \$50 Library, Any \$60 Library, Any \$75 Library, Any \$100 Library, Choice of Good Books.

Now For FEBRUARY.

This is a First-rate Month for Making up New Clubs, Completing those already begun, and Securing the Valuable Articles offered in our Premium List.

The Publishers of American Agriculturist and HEARTH AND HOME take pleasure in presenting their new general Premium List for 1874. The Premiums which they have offered in past years have engaged the attention of a very large number of persons of all ages and both sexes. Many thousands have secured Premiums, and very many of these, who at first had small hopes of success, have been themselves astonished at the ease with which they have raised large clubs and secured valuable Premiums.

Here is pleasant and profitable work for all. Boys and Girls, Young Men and Maidens, Middle-aged Men and Women, Farmers, Mechanics, Merchants, Professional Men, Anybody, Anywhere

who wishes to do good and make money, can do both by going to work as here invited by the publishers of these two most valuable journals, American Agriculturist and HEARTH AND HOME. You need only to show specimens of the papers, promise the beautiful Chromos, which are now ready for delivery, according to the publishers' offer, and forward your subscriptions. There is no danger of failure in the enterprise if you go into it with spirit. You may succeed in

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 2 to 8, 27 to 33, 55 to 78, and 81 to 93, inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express office nearest the recipient) to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance desired. Description of Premiums sent free to applicants.

Full Descriptions

of our Premiums are given in a previous number, and will be mailed free to applicants. We have room in this paper only for the following **Descriptive Notes**:

No. 1. — Moore's Floral Set.—This is a beautiful Premium—a complete set of **Ladies' or Children's Garden Tools** for the cultivation of flowers, consisting of a Floral Hoe, Spade, Fork, and Rake. They are made of the best steel and iron, with finely polished hard-wood handles, light, durable, and highly finished, and each set inclosed in a box. They will be found very convenient in the garden and greenhouse, and are pleasing toys for the little folks. Made by the **Moore Manufacturing Company, Kensington, Ct.**

Nos. 2, 3, 4.—Gold Pens: with ever-pointed Pencils, in extension, coin-silver cases.—Premium No. 2 contains the best No. 4 Gold Pen; and No. 3 the best No. 6 Gold Pen, which is the same style, but larger. No. 4 contains No. 7 Gold Pen, in Gold-tipped Ebony Holder. Each pen will be sent in a neat leather case by mail, post-paid. These pens are made by **Geo. F. Hawkes, No. 66 Nassau St.**, and have obtained an excellent reputation. We have known the maker and his goods for many years, and can recommend them.

No. 5.—Ladies' Fine Gold Pen, in Rubber Case, Gold Mounted, with Screw Extension, and Gold Ever-pointed Pencil. A beautiful present for a lady teacher or friend. Same maker as No. 2.

Nos. 6, 7.—Paragon Patent Revolving Pencil.—This is a beautiful Pocket Pencil, which is extended or closed by pulling or pressing the head. They are made with great care, and every Pencil warranted to work perfectly. They are gold-plated, and will last for years. We offer two patterns, one for ladies, with ring for chain, at \$1.50 each, and one of heavier and firmer plate, at \$3.00. Same maker as No. 2.

No. 8.—Payson's Indelible Ink, and Briggs's Marking-Pen Combination.—Payson's Indelible Ink is too well known to need further commendation. It is almost indispensable in the family. Briggs's Marking-Pen has been before the public for fifteen years, and is justly celebrated for all kinds of marking, and particularly for writing upon coarse fabrics. The Pen and Ink are put up in a neat case, being thus portable, always ready for use, and protected from loss or injury by evaporation or breakage.

No. 9.—Cake Basket.—A new pattern, oval-shaped, nicely chased—a very taking, useful, and beautiful table ornament. This, with other articles that follow, is made by the **Lucius Hart Manufacturing Co., of Nos. 4 and 6 Burling Slip, New York City**, and is warranted by them to be of the best triple plate. Mr. Hart, "the veteran Sunday-school man," was engaged in the same place and business for nearly a quarter of a century. We have known him and his work for many years, and have taken pleasure in commending and guaranteeing its value to be as represented. We believe the Company which bears his name is fully sustaining his reputation. The amount of silver upon plated ware depends wholly upon the will and integrity of the manufacturer. We could give nearly as good-looking plated ware for less than half the money.

No. 12.—One Dozen Teaspoons.—No. 13.—One Dozen Table-Spoons.—These are "figured tips," Olive-leaf Pattern, all of the same metal, plating, etc., and from the same makers as No. 9. They are far cheaper than anything we have found at half the price, and are well worth working for.

No. 14.—One Dozen Table-Forks.—The same description and remarks apply to these as to No. 13. We select as premiums only such articles as we can warrant in quality and price. All these articles come from the **Lucius Hart Manufacturing Co.**

No. 15.—Child's Cup.—A beautiful gift for the little one-year-old. It is made by the **Lucius Hart Manufacturing Co.** Triple-plated on the outside and gilded on the inside. It never breaks, and will last for many years—indeed, be a life-keepsake.

No. 17.—Child's Carriage, or Perambulator.—An elegant carriage, handsomely finished, upholstered with reps, has full plate tinned joints, handle tips, side lights, dash rail, panel body, and carpet on the bottom. These carriages are from the well-known manufacturer **C. W. F. Dare, 47 Cortlandt St., New York.**

No. 19.—Doll's Cottage Chamber Set.—A most attractive gift for a little girl. Eight pieces of furniture prettily painted: Bedstead (size $11\frac{1}{2} \times 18$ inches), bureau, table, commode, towel-rack, two chairs, one rocking-chair. From **C. W. F. Dare, 47 Cortlandt St., New York.**

No. 20.—Crandall's Improved Building Blocks furnish a most attractive amusement for children. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. For developing the ingenuity and taste of children they are unequalled. The Blocks are put up in neat boxes, accompanied by a large illustrated sheet giving various designs of buildings, etc. This is one of the most successful toys ever invented.

No. 21.—Crandall's Masquerade Blocks.—These are put up in boxes, the blocks in each of which will make, by various combinations, 300 different pictures in brilliant colors. They are not injured by washing, and afford endless amusement for children. They are beautiful gifts for the little ones.

No. 22.—Knives and Forks.—These have ebony and metal handles, manufactured by a patent process which unites them so firmly to the blades that they never work loose, and are rendered hot water-proof. The knife blades are silver-plated. Made in the best style by the **Woods Cutlery Co., 55 Chambers St., New York.** For this Premium we will give either the Table, Medium, or Dessert size, as may be specified by the recipient; six knives and six forks, or twelve knives without forks.

Nos. 23, 24, 25.—American Table Cutlery.—We are glad to be able to offer really good articles of American manufacture, such as are competing successfully with the best foreign make. **Messrs. Patterson Bros., 27 Park Row**, who supply us with these articles, are also importers of English goods. They recommend these Knives, manufactured by the **Meriden Cutlery Co.**, as equal to any Cutlery in the market, and their recommendation is a guarantee wherever they are known. We offer two kinds of Knives, and three sizes of each kind. No. 23 have Rubber Handles, which are actually boiling-water proof, so that, if they were accidentally to remain in it for several minutes, or even hours, they would not be injured. The Blades are of the best steel, and warranted. Dessert size, with Forks, sold at \$15. For 24 subscribers at \$1.50, or 80 at \$1, we will give either the medium size or the table size, sold at \$16.00. No. 24 have Ivory Handles, are selected with great care, have Steel Blades, and are beautiful goods. Dessert size, with Forks, sold at \$20.00. For 33 subscribers, at \$1.50, or 110 at \$1, we will send the medium size, sold at \$22.00. For 35 at \$1.50, or 116 at \$1, we will send the Table size, sold at \$23.00. The Forks, which accompany these Premiums, Nos. 23 and 24, are made of genuine Albata, and warranted double-plated with coin-silver. These Forks are furnished to us by Messrs. Patterson Bros. The Carving-Knife and Fork are made by **The Meriden Cutlery Co.**, with the best Ivory, balanced Handles.

Nos. 27, 28, 29, 30.—Pocket Knives.—HERE'S FOR THE BOYS AND GIRLS!—These Premiums are among the most pleasing and useful that we have ever offered. Every boy, and girl too, wants a pocket knife. We give them an opportunity to obtain a most valuable one for merely a little effort. These knives are furnished by the **Meriden Cutlery Co., 49 Chambers St., New York**, whose work is equal to any done in this country or Europe. No. 27 is a neat, substantial Knife, with three blades and buck-horn handle. No. 28 is a still finer article, with four blades and pearl handle. No. 29 is an elegant Knife, with five blades and shell handle. No. 30 is a Lady's Pocket Knife, a beautiful article, with four blades and shell handle.

No. 31.—Mulum in Parvo Pocket Knife.—Boys, Read this. This is a most attractive as well as useful Premium, from the **Meriden Cutlery Co., 49 Chambers St., New York.** It comprises, in one knife-handle, a large and a small blade, a screw-driver, a saw, a strong hook, a nut-cracker, a brad-awl, a gimlet, a corkscrew, a pointer, a slim punch, tweezers, and, in addition to this, it can be used for various other purposes which will at once suggest themselves to any smart boy or man. It is a pocketful of tools weighing but two ounces. The knives will be sent anywhere in our country, post-paid.

No. 33.—Extra Early Vermont Potato.—This remarkable potato is a seedling raised in 1867 from a seed-ball of the well-known Jackson White. It is supposed to have been fertilized from the Garnet Chili, as it resembles many seedlings of that variety. For five years the "Vermont" potatoes have been grown side by side with the Early Rose, both under the same treatment, and have proved seven to ten days earlier than that favorite sort; they are more productive, fully equal to the Early Rose if not superior in quality, flesh very white, dry, and floury, excellent keepers, and in every way a most promising variety. We have made arrangements with **Messrs. B. K. Bliss & Sons, 23 Park Place, New York**, to supply us with the genuine article, to go by mail, post-paid, to any part

of the country. They should go out before freezing weather, but when too late for this we will keep them until warm enough to mail them in the spring. This Premium can only remain open while the supply lasts.

No. 40.—Doty's Improved Clothes Washer, with the Metropolitan Balance Weight. Over seventy-five thousand families in the United States are using the Doty Washing Machine, and we believe the improved machine has no superior. The "help" use it and like it. Send for descriptive circulars to **B. C. Browning, 32 Cortlandt St., New York**, or to **Metropolitan Washing Machine Co., Middlefield, Ct.** It goes cheaply by freight or **Ex.**

No. 45.—A Good Watch.—The Watches made by the **American Watch Co., Waltham, Mass.**, have peculiarities of excellence which place them above all foreign rivalry. The substitution of machinery for hand labor has been followed not only by greater simplicity, but by a precision in detail, and accuracy and uniformity in their time-keeping qualities, which by the old method of manufacture are unattainable. A smoothness and certainty of movement are secured which proceed from the perfect adaptation of every piece to its place. The extent of the Waltham establishment, the combination of skilled labor with machinery perfect and ample, enable them to offer watches at lower rates than any other manufacturers. Their annual manufacture is said to be double that of all other makers in this country combined, and much larger than the entire manufacture of England. The mechanical improvements and valuable inventions of the last fifteen years, whether home or foreign in their origin, have been brought to their aid, and the presence of nearly 800,000 Waltham Watches in the pockets of the people is the best proof of the public approval. We offer a Silver watch, jeweled, with chronometer balance, warranted by this Company as made of the best materials in the best manner, and in pure coin-silver "hunting" case; weight 3 oz. This watch we offer as one of our Premiums, with the fullest confidence. Upon the movement of each of these watches will be engraved, "AMERICAN AGRICULTURIST. MADE BY THE AMERICAN WATCH CO., WALTHAM, MASS."

No. 46.—Ladies' Fine Gold Watch.—This elegant Premium will delight our friends who may receive it. Our arrangement with the **American Watch Co.** (see No. 45 above) includes these beautiful gold watches. They are full-jeweled, in 18-carat "hunting" cases, warranted to be made of the best materials, and possessing every requisite for a reliable Time-Keeper. Upon the movement of each Premium Watch will be engraved "AM. AGRICULTURIST. MADE BY THE AM. WATCH CO., WALTHAM, MASS."

No. 48.—Double-Barrel Gun; OR FOWLING PIECE.—These guns are the genuine London "Twist" barrel, Patent Breech, Bar Lock, ebony ramrod, and in all respects desirable. Their caliber and length of barrel vary, and may be ordered to suit the kind of shooting to be done. They are furnished for this Premium by **Messrs. Cooper, Harris & Hodgkins, 277 Broadway**, well known as one of the most reliable and best houses in their line of business, and they highly recommend this particular gun, and guarantee it in every respect. It is from one of the oldest and most favorably known English manufacturers. The price is not put on in fancy carving and plating for show, but in the gun itself. This Premium includes Gun, Powder-Flask, Shot-Pouch, and Wad-Cutter.

No. 49.—Remington's Sporting Breech-Loading Rifle.—The Rifle offered as this Premium has a 30-inch steel barrel, and can be of any weight from 8 to 12 lbs., and of any caliber from $22/100$ to $50/100$, as may be desired. Ammunition is extra, and at prices varying in accordance with the caliber. These rifles are manufactured by the noted firm of **E. Remington & Sons, Nos. 281 and 283 Broadway, New York**, whose reputation is world-wide, and who stand in the front rank of manufacturers of fire-arms.

Nos. 81 to 92.—Good Libraries.—In these premiums, we offer a choice of Books for the **Farm, Garden, and Household.** The person entitled to any one of the premiums 81 to 92 may select any books desired from the list of our books published monthly in the *American Agriculturist*, to the amount of the premiums, and the books will be forwarded, Post or Express paid. Let the farmers of a neighborhood unite their efforts, and through these premiums get an agricultural library for general use. See Table List of Books in advertising columns.

No. 93.—General Book Premium.—Any one sending 25 or more names, may select books from our list to the amount of 10 cents for each subscriber sent at \$1; or 30 cents for each name sent at \$1.20; or 60 cents for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through, by us. See List as in No. 81.

Disease in Fowls' Legs.—"W. H. H.," Alton, Ill. Sores in the joints of a fowl's legs which eat away the joint in two weeks, must arise from a very serious constitutional disturbance, and any remedy is doubtful. It might be well to try a dose of sulphate of soda as large as a pea in a pill of bread or dough each day for a few days, and changing the food. The sores should be washed daily with warm soap and water. Closely bred fowls are more frequently thus troubled than others, and a change of blood would be desirable.

Co-operative Store.—"T. E. E.," Plainfield, Ind. The managers of the co-operative store in Sedalia, Mo., would doubtless be glad to give—if requested—information as to their plan of business to persons who desire to organize such an institution. A town of 1,500 inhabitants ought to present a field large enough for such a business.

For a Jumping Colt.—"J. H.," Clarkson, Iowa, says if a halter is put upon a colt, and the end of the halter strap passed between the forelegs and fastened to a strap around the horse so that he can not raise his head higher than a level with his back, he can not jump, and it will not interfere with his feeding.

The Potato Disease.—Early last year an Englishman whose name has escaped us offered a handsome sum as a prize for the best essay on the potato disease and its cure. The council of the Royal Agricultural Society, in whose hands the matter was placed, do not advise making any award. They recommend, however, that a sum of money be appropriated for the careful investigation of the potato fungus (*Peronospora infestans*), which is now admitted to be the cause of the trouble. What a chance here is for the remarkable microscopist of our remarkable Department of Agriculture.

A Heavy Ox.—The Butchers' prize for the heaviest bullock at the Birmingham (Eng.) Fat Cattle Show was this year awarded to a cross-bred ox out of a polled Scotch cow by a short-horn bull. The animal weighed 2,666 pounds. Last year the first prize at the Smithfield Fat Cattle Show was taken by a polled ox. This certainly shows well for the feeding qualities of the polled stock.

Scratches.—"T. G. P.," Hessville, West Va. Scratches is an inflammatory suppurative action of the skin of a horse's heels and hind legs. It is often very difficult of cure. At other times it readily submits to very simple treatment, such as washing the parts quite clean with a solution of one dram of carbolic acid to a pint of water. After the washing the legs are wiped quite dry with a soft cloth, and anointed with glycerine as often as is needed to keep the skin from becoming dry. At the same time the horse should have half an ounce to an ounce of sulphate of soda in the feed twice a day. Care must be taken to keep the legs clean and dry and free from mud, which is in many cases the direct cause of the trouble.

Measure for Hay.—"W. H. W.," Glendale, Ky. The estimates for the measurement of hay in the mow are all intended for solidly packed hay, and the average of the whole mow. The bottom of a deep mow will be heavier, and the upper part will be lighter than the centre, which represents the average of the whole. The same refers to a stack.

Mulum in Parvo.—"E. W. T.," Wicomico Co., Md. Peruvian guano would be a very good fertilizer for oats, as will hen manure mixed with earth, but it should be used more liberally than guano. The best fertilizer for corn is the dried blood manure; we have seen some extraordinary results from it. It may be procured in Baltimore. No one can justly expect much of a corn-sheller for one dollar. A dollar's worth of such an article would be very little and yet it might be worth its cost. Artificial hatching of eggs is perfectly successful so far as to produce chickens; the operation always fails at this point because the chickens can not take care of themselves and they die faster than they were hatched. A hundred light Brahma fowls will cost from \$250 upwards if really good ones.

Concrete Buildings.—"H. H. S.," Los Angeles, Cal. The article upon concrete buildings appeared in the *Agriculturist* of March and August, 1872. As these numbers may be procured in any desired quantity it is not necessary to reprint the article.

Diseased Udder.—"J. W. P.," Bureau Co., Ill. A gathering upon the udder of a cow which finally breaks and forms a running sore is as likely to have occurred from a blow, a kick, or a punch with an

other cow's horn as anything. It should now be treated by injecting into the sore with a syringe a solution of one dram of carbolic acid in a pint of water, each morning and evening, until the offensive discharge ceases and it begins to heal in a healthy manner, after which it should be cleansed daily with the same solution until healed.

Pipes for Drains and Irrigating.—"H. H. S." Earthen pipes for drains have been made for many years; there is no patent right upon them. Common drain tiles may be used for irrigating by turning the water into them, which would escape at the joints. It would be simply the reverse of draining. We shall be happy to receive the communications referred to.

Buff Cochins.—"W. H. B." Buff Cochins fowls are included amongst the profitable egg-producers. Nevertheless there are some varieties, as the Spanish and the Leghorns, which are more prolific in this respect than the Cochins. The Brahmas are also preferable to the Cochins, standing, in our opinion, next to the Leghorns, especially as winter layers.

Oil Meal.—"C. L.," Lancaster Co., Pa. Oil meal may be kept perfectly well in a dry place. If in large bulk it will heat, and if the place is damp it will mold. It is best kept in flour barrels or in a bin in the granary, and if it shows any signs of heating it should be shoveled over or transferred to another bin. Two quarts daily will be a fair allowance for a cow. One pint daily is enough for a calf, and a pint in each feed will be enough for a horse in addition to his other feed.

Foot and Mouth Disease in Sheep.—"Englishman," Lynchburg, Va. The symptoms described, viz: sores around the coronet of the hoof and for two inches up the leg, and between the cleft of the foot, also sores upon the lips appear to point to Aphthæ, or what is known as the foot and mouth disease. At the same time it may be only a vesicular eruption which frequently occurs upon the feet and which is conveyed to the mouth by contagion in consequence of the animal licking the sores upon the feet. We would wash the feet and touch the sores upon the lips with the following, viz: 2 drams chloride of zinc, 1 oz. tincture of myrrh dissolved in one pint of water. Each sheep should take two ounces of epsom salts with a little ginger or a few tea-spoonfuls of peppermint water. The feet must be kept well washed with the solution and the sheep be kept upon a dry barn floor until recovered.

Windmill.—"L. D. S.," Huron, Ohio. For information as to windmills write to the United States Windmill Company, Batavia, Illinois.

Poultry for Profit.—"A. J. W.," Toledo, Ohio. The most profitable breed of poultry, we believe to be the light Brahmas; they are good layers, mature early, are heavy bodied when mature, have good flavored flesh, are good sitters and mothers, are hardy, very docile and not inclined to wander, can be kept inside of a fence five feet high or less, are handsome, and are salable either living or dead. Wright's and Lewis's poultry books are useful works upon this subject.

Harrowing Corn.—"J. P. L.," Ringwood, N. C. When the Thomas harrow is used to harrow young corn it is run indiscriminately over the field, the young corn not being injured excepting occasionally a stalk is torn out. But no other harrow should be used for this purpose in this way. The usual corn harrow is a V harrow which has the central tooth removed; it is passed over the row so that the plants are passed over by the space left by the removed tooth, and each side of the row is harrowed. Handles are used to guide it.

Sheep Farming in Texas.—"Stone.," Chicago. The only part of Texas now left for cattle and sheep feeding upon the range is the western part of the state. In the East settlements are becoming too thick for the comfort of cattle men. For information as to lands the Commissioner of Public Lands, Austin, Texas, should be written to.

Darnel.—This grass (*Lolium temulentum*), a native of Europe, is more or less introduced into this country. It has long enjoyed the distinction of being the only grass that produced seeds having poisonous qualities. This character was attributed to it by both agriculturists and botanists of early times, and it has been kept stereotyped in all the books upon grasses. Mr. Alexander Stephen Wilson has been experimenting with Darnel, and has presented his results in two papers read before the Botanical Society of Edinburgh. In his last paper he stated that he has eaten it mixed with wheat and oat-meal in very much larger quantities than it would be naturally mixed with those grains, in hot and cold

bread, taking over four ounces of Darnel in a day, without experiencing any effects whatever.

The Poitou Ass.—"H. P.," Dover, Del. To import a Poitou jack would cost a large sum of money. By importing several, each one would cost less in proportion. An animal may be purchased in France for from \$1,000 to \$2,000, as they are very highly valued and are reluctantly sold. It would not be safe to purchase unless in person, so that there would be traveling expenses back and forth, say \$400, and freight of the jack, which would be at least \$150. Still as these animals are exceedingly valuable the importation of a pair of asses would undoubtedly be a benefit to the public if it should not be profitable pecuniarily.

Goats for Milk.—"S. H.," Piereeville, Ind. We do not know where milk goats that are able to milk four quarts a day could be procured. That is about the average yield of our common cow. If ordinary goats yielding a fourth of that quantity would be desirable, a thousand or two could be purchased in the cities of New York, Brooklyn, and Philadelphia for about the price of common sheep, and their removal would be a relief to the inhabitants of those cities who have gardens and shade trees, upon which these creatures love to depredate.

Oleo Margarine.—"A. R. F.," Kansas City, Mo. We would repeat what we have already said in noticing the fact that suet is manufactured into so called butter, that the product is not butter in any sense, nor do we believe for a moment that the manufacturers of the stuff can ever induce people knowingly to purchase it. If it is put into the market as butter it is a fraud, and we would not advise any parties to go into a fraudulent business, but on the contrary to avoid it although it might be a profitable one.

The Burlington and Missouri Railroad Company have sold along their line in Iowa and Nebraska, within thirty-three months, 478,938 acres to 4,525 purchasers, on ten years' credit and six per cent interest. On sales made since 1873 no part of the principal is payable until the end of four years, while twenty per cent is deducted from land prices for prompt improvement.

The Volinia Farmers' Club sends us its printed programme for 1874—which shows a judicious variety of discussions and field trials for nearly every month in the year. We assume that this club is held at Volinia, Mich., but there is nothing on the programme to show that it is not at Volinia, Japan. We hope our Volinia friends will not take this criticism amiss, as we only use their oversight to say to the officers of societies and clubs that a large share—half, if not more, of the printed circulars and communications that come to us mention neither county nor State, and if the post-mark happens, as is usually the case, to be indistinct, we have no clue to their whereabouts.

Leather and Farmers' Refusings.—"H. F. B.," Sing Sing, N. Y. All the refuse parts of the hide of an animal are valuable for fertilizing purposes, as is also the liquor in which such refuse has been hoiled. Long steaming under great pressure is needed to make bones easily crushed into powder, and then they are not so valuable as the raw bone-dust, because they have lost all their nitrogenous matter. Liquid manure is best applied by means of a spreader such as has been already described in the *Agriculturist*.

Crop for an Orchard.—"G. R. B.," Seymour, Ind., has an apple orchard just in bearing. He wants to know whether to cultivate it with some crop or sow it to grass, and what kind of grass or crop is the best one.—"G. R. B." should consider that it is unfair to land to ask too much of it. As trees are usually planted in orchards, the fruit is all the crop that should be taken from the land; if potatoes or other root crops are grown they should be so well manured that the land will lose nothing. Perhaps the best treatment for an orchard is to sow it to clover and pasture hogs upon it. This will keep the soil constantly improving and have the advantage of disposing of the windfalls.

Worms in a Cow.—"S. B. D.," Downieville, Cal. Cows are sometimes, especially when young, troubled with small, thread-like worms of two varieties. The irritation of the skin, which causes the cow to rub the hair off, may be due to the disturbance of the system consequent upon the presence of the worms. The remedy is to give before feeding in the morning, one pint of linseed oil, two ounces of oil of turpentine, with half a pint of infusion of quassia mixed together. Repeat the dose in ten days. Salt regularly given is almost a sure preventive of internal parasites in all farm stock.

TO FARMERS & PLANTERS.

DOUBLE REFINED POUDETTRE for sale in lots to suit customers. This article is sold for half the price of other fertilizers, and is cheaper for Cotton, Corn, Tobacco, and Vegetables than any other in the market. Price, delivered on board in New York City, \$25 per ton. Ask attention to the following testimonials:

CHARLES A. MESSENGER, Providence Co., R. I., writes: "The Double-refined Poudre I bought of you has given satisfactory returns, and I consider it the best of anything I can use for an early crop."

THOMAS W. LATHAM, Providence Co., R. I., writes: "I would rather have your Double-refined Poudre than any phosphate I ever used. Where I used it on Potatoes it was far ahead of any other manure."

L. H. SHELDON, Sup't of the New Jersey State Reform School, writes: "We have used Poudre for several years upon our farm crops, and for the money invested we have found nothing that has done us so much service."

S. J. KELLY, Burlington Co., N. J., writes: "I used Double-refined Poudre on Rutabaga Turnips alongside of Peruvian Guano and Hen Manure. Where the Poudre was applied the increase was thirty per cent over the others."

WILLIAM H. CADY, Ocean Co., N. J., writes: "I used Poudre on Corn, Sweet and round Potatoes, Onions, and Lima Beans. It brought forward my crops two weeks earlier. I think it the best manure I ever used, giving better results than Peruvian Guano, at much less cost."

VAN ANTWERP AND VAN BUREN, Montgomery Co., N. Y., writes: "Poudre has been used in this locality for ten years past, mostly on Corn, and those who have used it say they have from 1/4 to 1/2 more Corn by using the Poudre."

W. F. GERKIN, of Essex Co., N. Y., writes: "I have used the Double-refined Poudre for the last five years, and I consider it the cheapest fertilizer I can buy—giving the best results for the cost."

MILTON STRONG, Suffolk Co., N. Y., writes: "I gave Poudre a thorough trial this year, using it upon Corn, Potatoes, Lima Beans, Tomatoes, and Vines, and I have never raised better crops. My Corn will yield 100 bushels of ears per acre, and my garden was the surprise and admiration of all who saw it."

HENRY T. HORTON, Cheshire Co., N. H., writes: "I find, from experiments made last year, the Double-refined Poudre is the cheapest fertilizer to use on Tobacco. I put it beside Peruvian Guano with equal cost of both, and the Tobacco was 30 per cent better where I used Poudre."

W. H. REMINGTON, Hartford Co., Ct., writes: "I have used Poudre on Corn, Potatoes, and Tobacco. There was but one piece of Corn in the place equal to mine, and that had 30 loads of manure per acre and mine none. The Tobacco started as soon as set and grew luxuriant."

WM. S. POMEROY, of Hartford Co., Ct., writes: "I have used the Double-refined Poudre for several years on Tobacco, and I think it one of the best fertilizers made for this crop."

A Pamphlet giving full directions, etc., sent free on application to
JAMES T. FOSTER,
66 Cortlandt Street, New York.

GENUINE Peruvian Guano.

FARMERS, AGRICULTURISTS, and DEALERS in Fertilizers have now an opportunity of obtaining this valuable manure in small or large lots, at importers' prices, by applying to the Special Agency just established for the purpose of delivering Genuine Peruvian Guano to consumers at any accessible port or railway station in the country. Full particulars given in circular mailed free on application to

CARHART'S PATENT Two Horse Pulverizing Cultivator

IMPROVED.

The Depth can be Regulated by a simple Movement of the Lever, convenient to the Hand of the Driver.

WHY IT IS THE BEST CULTIVATOR.

Because it Draws Lighter than any Wheel Cultivator. Costs one-half less. Will Exterminate Quack and Thistles. Can be run close to a plant or a tree without injuring it. Cultivates Hops successfully. Cultivates Corn first time effectually. Runs steady, being drawn with a pole. Will Pulverize sod with a proper adjustment of the teeth. Is Strong and Durable. Sells readily, and every sale brings another order from a neighbor, with an unsolicited testimonial filled with enthusiasm in regard to its merits.

Better worth the money, and will pay for itself quicker than any implement ever placed upon the farm.

Price only \$22 Complete.

We will make the following liberal offer for the next three months, in order to introduce this Cultivator where it has heretofore been unknown. Viz.: To any practical farmer who will act as agent we will send one New Improved Cultivator at 25 per cent discount from above price when the cash accompanies the order, and if it does not prove to be all that it is represented we will refund the money, and as evidence on our part of the faithful performance of the guarantee we refer to our forty years' reputation as manufacturers.

Send for Descriptive Circular with testimonials. We furnish THISTLE TEETH, as shown in cut, or the REVERSIBLE OVAL TEETH, as preferred. In ordering, please state which teeth are desired.

SALT CREEK, AT ASHLAND, NEB.—LOOKING TOWARD THE PLATTE HILLS, FROM THE MILL HILL.

**IF YOU WANT A FARM OR HOME,
YOU SHOULD BUY OF THE**

BURLINGTON AND MISSOURI RIVER RAILROAD CO.

- BECAUSE**—Their prices are low, ranging for the best land from Three to Ten Dollars per acre.
- BECAUSE**—No payments are required of the purchaser for four years, except interest at six per cent.
- BECAUSE**—After the expiration of four years, **SEVEN YEARS** are allowed for payment of the principal.
- BECAUSE**—You are not obliged to go into a wilderness, but into a well-settled State, the population of which is rapidly increasing.
- BECAUSE**—The mildness of the climate and fertility of the soil is such that the settler can pay for his farm from the products raised upon it long before the time when the principal becomes due.
- BECAUSE**—Failure of crops from drouth is unknown.
- BECAUSE**—Large allowances are made upon fare and freight, thus giving low rates on both to purchasers of this Company's lands.

AND YOU SHOULD BUY THIS YEAR.

BECAUSE—Purchasers during 1874 who cultivate one-half their land within two years from their purchase are allowed a reduction of twenty per cent on the price of their land.
LARGE DISCOUNTS also, **FOR CASH**, within One, Two, or Three Years.

 439 Third Avenue, New York.

The Mystery OF Metropolisville,

By EDWARD EGGLESTON,

Author of "The Hoosier School-Master," "The End of the World," etc.

FINELY ILLUSTRATED.

NOTICES BY THE PRESS.

If by "the American novel" we mean one which portrays graphically those features of American life which are distinctly American in that they are developed nowhere else—which catches up the expression and reflects the character of the ideal and unexaggerated American man and woman—then we may as well give over seeking for it, for it has come, and Edward Eggleston is its author. . . . Truthful characterization, a ready humor, a graphic style, and a skillful use of the Hoosier dialect combine to make *The Mystery of Metropolisville* a vivid picture of the times and scenes with which it has to do. We award Mr. Eggleston the palm as the most characteristically American writer of the day.—*Boston Journal*.

The story is told with much spirit.—*Pittsburgh Leader*.

It is a good story, told with vim and naturalness.—*Daily Commercial*, Wilmington, Del.

The plot of the story is very simple, but the happy faculty the author possesses in delineating border life is used to capital effect.—*Weekly Advertiser*, Portland, Me.

It is finished better than either of the former ones ("Hoosier School-Master" and "End of the World"), and has less of the preacher and more of the novelist in it.—*Springfield Republican*.

It is a very bright and readable book.—*Liberal Christian*, New York.

The tendency of the book will be to make a brave, true life honorable, and to make "dleness, hypocrisy, and religion odious.—*Methodist Recorder*, Pittsburgh, Pa.

It is marked by power, close observation, and has some remarkably well-drawn characters.—*Globe*, Boston.

It will be read with general interest, and start the tears and risibles alike.—*Commonwealth*, Boston.

At intervals a writer comes to the surface whom everybody wants to read, and we doubt whether either Dickens or Mrs. Stowe took stronger hold on the popular heart than has the author of these hearty, home-life sketches. In the present volume he greatly enlarges his sphere, taking a widely different class of characters and topics in hand than was attempted in the former volumes. His sterling personal character gives weight and worth to whatever he sends forth.—*Methodist Home Journal*, Phila.

He (the author) particularly excels in treating of certain phases of American manners, and this is the main task which he wisely places before himself.—*Daily Palladium*, New Haven.

All the characteristics of Western life are well illustrated in this racy volume—the rough and the smooth, the coarse and the fine.—*State Republican*, Lansing, Mich.

The story is well and truthfully told, and has one merit so often sadly wanting in modern literature—it is entirely free from all objectional immorality and vice, and will no doubt become immensely popular.—*Daily Chronicle*, Washington, D. C.

CONTENTS.

Preface.—Words Beforehand.—Chapter I. The Autocrat of the Stage-Coach.—2. The Sod Tavern.—3. Land and Love.—4. Albert and Katy.—5. Corner Lots.—6. Little Katy's Lover.—7. MONEY IN THE GARDEN.

A VEGETABLE MANUAL,

PREPARED WITH A VIEW TO

ECONOMY AND PROFIT,

BY P. T. QUINN,

PRACTICAL HORTICULTURIST.

In this work the author aims to give, in a plain, practical
style, instructions on three distinct although closely con-
nected branches of gardening—the kitchen-garden, market-
garden, and field culture; the only and sufficient credentials
for the fitness of his undertaking being a successful practical
experience for a term of years.

CONTENTS.

Chapter I. Money in the Garden.	Chapter VIII. Melons.
" II. Hot-beds.	" IX. Onions.
" III. Artichoke.	" X. Parsley.
" IV. Beans.	" XI. Radishes.
" V. Cabbages.	" XII. Salsify.
" VI. Egg-Plants.	" XIII. Tomatoes.

Farm - Gardening

AND

SEED - GROWING.

BY FRANCIS BRILL.

NOTICES BY THE PRESS.

Orange Judd & Co. have added to their splendid catalogue
of agricultural books "Farm-Gardening and Seed-Grow-
ing," by Francis Brill; it is practical, plain, complete, and
satisfactory, so that for a small amount of money a great
deal of desirable information can be obtained. If there is
any firm anywhere which is to-day disseminating so much
knowledge in regard to tilling of the soil as this same said
firm of Orange Judd & Co., we will present a medal to our
informers.—*Watchman and Reflector* (Boston).

The want occasionally expressed to us of a work on the
cognate subjects above named (Farm-Gardening and Seed-
Growing), is now met in a book under this title from the
pen of Mr. Francis Brill, formerly a market-gardener and
seed-grower at Newark, N. J., and at present engaged in
raising seeds at Mattituck, L. I. Its directions are concise
and practical, covering those points on which a beginner is
most likely to require information.—*Country Gentleman*.

Mr. Brill has had large experience, and derived his knowl-
edge wholly from the school of actual tests.—*Chicago
Evening Journal*.

We have in this volume the results of a practical man's
experience in raising root crops and other vegetables in the
market-garden. Not only the professional seed-grower and
trucker, but the amateur gardener who has a little patch in
his suburban home, will find many a valuable hint and di-
rection in this full and comprehensive manual.—*Sunday-
School Times*.

It seems to be a very sensible, practical work by a practi-
cal man. Mr. Brill's father was a gardener; and he himself
has had an extensive experience, and he talks about what
he knows, which is more than can be said of many authors of
industrial works.—*Moore's Rural New Yorker*.

There can be no question that this farm-gardening can be
made in many districts of the Southern Atlantic States, es-
pecially near the coast, far more profitable than growing the
ordinary staple crops. In connection with producing the
vegetables, the growing and saving their seeds receive
minute attention.—*American Farmer* (Baltimore).

This industry is now occupying the attention of many per-
sons who sell their products to the great seed-houses, and
novices who have the facilities, and wish to enter upon the
business, will find in this book just the hints needed.—
Springfield Republican.

Mr. Brill has been a successful farm-gardener and seed-
grower for a number of years, and gives in a clear and con-
cise form the knowledge he has gained. . . . It gives the
best method of manuring, planting, and cultivating every
vegetable sold in markets—in short, everything required to
be known, plainly and fully—and should be in the hands of
every one who cultivates so much as a rod of land, for
family use, pleasure, or profit.—*Suffolk* (L. I.) *Times*.

The seal of Orange Judd & Co. upon an agricultural pub-
lication is sufficient guarantee of its worth. Francis Brill's
book, published by them, is a very complete work, giving
plain, minute instructions as to raising, taking care of, and
bringing to market those vegetables which are most in de-
mand in the large cities, and those seeds which are being
called for throughout the country.—*N. Y. Evening Mail*.

The work of showing how this can be accomplished has
fallen in good hands, and it has been done well. The book
will well repay perusal, and we hope soon to see its good
effects in a more intelligent direction of farm industry, and
accompanied by more satisfactory pecuniary results.—*The
Signal* (L. I.)

To the market-gardener, or even the owner of a small
piece of tillable land, this book will be of great value.
Qualities of soil required for the growth of different vegeta-
bles, how to plant, how to cultivate, to harvest and preserve
during winter.—*N. Y. Citizen and Round Table*.

Price, Post-paid, \$1.00.

OUR NEW CHROMO,

ENTITLED

"Up for Repairs,"

A

Beautiful, New Picture

For Every Subscriber

TO THE

American Agriculturist

FOR 1874.

The great satisfaction which has been expressed by tens of thousands of subscribers to this paper who have received the picture entitled "Mischief Brewing," has led the Publishers to provide another beautiful Gift for their patrons for the coming year.

An exquisite Oil Painting by the celebrated American Painter, Mr. B. F. Reinhart, executed expressly for the *American Agriculturist* and entitled

"UP FOR REPAIRS,"

has been most successfully reproduced in Chromo by the well-known firm of Beneke & Seott. It is a picture of a scene in childhood, which many will recognize as what they have themselves witnessed or been actors in, and can not fail to please both old and young. The Chromo is so perfectly done as scarcely to be distinguished from the original.

The Publishers will give this beautiful Chromo

To Every Subscriber

to this paper for the year 1874 received after this date, as detailed below. It is ready for immediate delivery at 245 Broadway, Free of Charge.

If to go by mail, 10 cents must be sent to cover cost of packing and postage. **For 25 cents it will be Mounted, Varnished, Packed, and sent Post-paid.**

N. B.—The Chromo will be delivered:

At the Office, **Unmounted**, Free.

“ “ “ **Mounted**, 15 cents extra.

Sent by Mail, **Unmounted**, 10 cents extra.

“ “ “ **Mounted**, 25 cents extra.

We advise all to have them mounted before leaving the office, as in the large quantities we put up we are able to mount them for a quarter of the cost of doing it singly, and better than it can usually be done elsewhere.

The picture is designed for every subscriber upon the terms stated above, which please read carefully; and on these terms all are alike entitled to it, whether their names come singly at \$1.50 each, or in Clubs of Four for \$5, or Clubs of Ten at \$1.20 each, or in Clubs of Twenty or more at \$1 each. Subscribers in Premium Clubs will also thus be entitled to it.

N. B.—A few of the beautiful pictures entitled "MISCHIEF BREWING," which have been given to so large a number of subscribers, are still in stock, and, while any remain, subscribers to the *American Agriculturist* can have their choice between this and the new Chromo "UP FOR REPAIRS;" but the choice must be named at time of subscribing.

For Yourself and for All

In Your Home.

WHAT ARE THEY?

THE

American Agriculturist,

ISSUED MONTHLY,

FOR THE

FARM, GARDEN, AND HOUSEHOLD,

Including a Special Interesting and Instructive Department for CHILDREN and YOUTH.

The *American Agriculturist* was established in 1842. It is a large periodical of 44 quarto pages, filled with plain, practical, reliable, original matter, including hundreds of beautiful and instructive Engravings in every annual volume.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each; Four copies for \$5; Ten copies for \$12; Twenty copies and upward, \$1 each. 12 cents a year extra, for each, when sent to British America.

Either English or German Edition at these prices.

Hearth and Home,

ISSUED WEEKLY.

A Paper for Everybody.

HEARTH AND HOME, issued every week, is one of the most valuable Journals in the world. Its general features embrace the **Best Original Stories**, of the purest character and highest grade, from the most eminent writers; good **Editorials**; a most capital **Household Department**, helpful to every woman; a **Children's and Youth's Department**, that for pleasing and instructive stories, etc., and for arousing a healthful spirit of emulation in children is unequalled.

TERMS, IN ADVANCE: One copy, one year, \$3; Four copies, one year, \$2.75 each; Ten or more copies, \$2.50 each.

20 cents a year extra when sent to British America.

\$4 secures both HEARTH AND HOME and *American Agriculturist* for a year.

A Beautiful Picture (as described in another column) is given to each yearly subscriber.

ENTITLED

"Look Out!"

A

BEAUTIFUL, NEW PICTURE

For Every Subscriber

TO

Hearth AND Home

FOR 1874.

Another fine Oil Painting has been executed by Mr. Reinhart for the Publishers of HEARTH AND HOME. It has also been reproduced with great success in Chromo. This Picture, which is entitled "LOOK OUT!" is finely colored, and the same in size as the Chromo "Up for Repairs," which has been executed for subscribers to the *American Agriculturist*. It is designed as a Present for ALL Subscribers to HEARTH AND HOME for the year 1874, received after this date, including single subscribers, those in Clubs, etc.

It will be delivered at 245 Broadway free of charge. If to be sent by mail, 10 cents must be furnished to prepay packing and postage. **For 25 cents it will be Mounted, Varnished, Packed, and sent Prepaid to subscribers to HEARTH AND HOME for 1874.**

N. B.—The Chromo will be delivered:

At the office, **Unmounted**,.....Free.

“ “ “ **Mounted**,.....15 cts. extra.

If sent postpaid, **Unmounted**,...10 cts. extra.

“ “ “ **Mounted**,.....25 cts. extra.

A few of the beautiful pictures, "The Strawberry Girl," which have been given to thousands of subscribers, are still in stock, and, while any remain, subscribers to HEARTH AND HOME can have their choice between this and the new Chromo, "Look Out!"; but the choice must be named at time of subscribing, and if the first is taken, **50 cts.** extra, instead of 25 cts., must be sent for mounting, packing, and prepayment.

The price of HEARTH AND HOME is \$3 a year, or \$4 secures HEARTH AND HOME and *American Agriculturist*.

\$3.25 will pay for HEARTH AND HOME and New Chromo mounted, and Chromo will be packed and sent, prepaid, to the subscriber. (\$3.50 if Chromo "Strawberry Girl" is taken instead of "Look Out!")

\$1.75 will pay for *American Agriculturist* and Chromo, mounted, and Chromo will be packed and sent, prepaid, to the subscriber.

\$4.50 will pay for *American Agriculturist* and HEARTH AND HOME together, with both Chromos, mounted, and Chromos will be sent, prepaid, to subscriber. (\$4.75 if Chromo "Strawberry Girl" is taken.)

THE GENUINE EXCELLENCE and priceless value of the new method of curing Rupture with certainty and without inconvenience to the sufferer is well illustrated by the following letter, the original of which may be seen at the New York business office of the Blade, Bates & Locke, corner of Park Row and Beekman st. 'To the Editor of the Toledo Blade: About ten months ago I saw in your paper an advertisement of the Elastic Truss, directing to send for circulars to the Elastic Truss Co., No. 683 Broadway, N. Y. City. I was at that time laboring under pain and all the inconvenience of rupture. I sent as directed and obtained a circular, and also, by measurement and directions, I obtained the Truss and applied it. I have worn it about nine months, and I am happy to say to you to-day that, though I am seventy-four years of age, I consider myself cured, and all without pain or inconvenience. I still wear the Truss as a matter of choice; it seems like a part of my clothing. I would say to every one afflicted with Hernia: Try it—it will cure. I want to say to you that the knowledge I obtained through that advertisement has been worth more to me than the subscription of the Blade for twenty years; and I believe it to be the duty of every newspaper in the land, from the Congressional Globe to the smallest village paper, to publish it for the good and benefit of suffering humanity. Yours truly, C. P. LANPHELE.' This new Truss is sold cheap, and sent by mail, and circulars sent free, by the Elastic Truss Co., No. 683 Broadway, New York City.

Sexual Physiology. By R. T. TRALL, M. D. Containing Sexual Generation; the Physiology of Menstruation; Impregnation; Pregnancy; Parturition; Lactation; the Law of Sex; Regulating the Number of Offspring; the Law of Sexual Intercourse; Hereditary Transmission; Philosophy of Marriage. Prof. Wilder, of Cornell University, says it is the best work yet written on the subject. 20,000 sold. Price \$2.00 by mail. For \$3.50 we send this book, The Herald of Health for one year, and a volume of the Complete Works of Shakespeare, containing 1,000 pages and 36 Illustrations. Agents wanted. WOOD & HOLBROOK, 15 Light St., New York.

HUSSEY'S NATIONAL COTTAGE ARCHITECTURE; OR, HOMES FOR EVERY ONE. With Designs, Plans, Details, Specifications, and Cost; with Working Scale, Drawings complete, so that Houses may be built direct from the book. Adapted to the popular demand for practical, handsome, and economical homes. Royal Quarto. Six Dollars, post-paid. ORANGE JUDD COMPANY, Publishers, 245 BROADWAY, NEW YORK.

PLOWING SOD. — Drawn and Engraved for the American Agriculturist.

The manurial value of a sod plowed beneath the surface very much depends upon the manner in which it is turned under. If the furrow is turned in a continuous strip unbroken and made to lap upon the preceding furrow, as it appears in the above engraving, the utmost value of the sod is secured. For it is only as it becomes decomposed and furnishes food for the succeeding crop that it is of any value. If the furrow is irregularly turned and broken into fragments a large portion of the sod is unburied; it simply dries upon the surface and remains useless. Besides a furrow so turned furnishes a poor seed-bed because it is not compact and solid. On the contrary, a properly

turned sod forms an excellent seed-bed. The surface of the field when plowed forms a succession of ridges of soil exactly parallel with each other. When these ridges are harrowed down the sod beneath is not torn up, but is evenly covered with a fine layer of soil just sufficient in depth to form a seed-bed, beneath which there is stored every particle of the sod in the best condition to furnish food for the young plants, the roots of which penetrate the soil exactly where their food lies. This is apparent when the position of the furrow slices, as above shown, is observed.

Unfortunately we possess few plows that are capable of turning such a furrow as is here

described. The mold-boards of our plows are in general too short to turn a perfectly unbroken furrow. The better farming of our neighbors, the Canadians, and the English farmers, is to some extent due to the extreme care with which they plow, especially sod land. With us the yield of corn depends greatly upon the manner in which the sod is plowed, and the kind of plow we use becomes a very important consideration. The plow shown in the engraving is an iron beam English one, of the Scotch pattern, having a share about four feet long. Its great length enables it to turn the furrows with perfect regularity, leaving the soil in the best condition.

Desirable Wood-Lands.—"A Young Farmer," Elmira, N. Y. There is a large tract of very desirable forest lands still unoccupied in Michigan. These lands are now made accessible by several railroads. The Grand Rapids and Indiana Railroad has opened a fine country near Grand Traverse Bay, covered with beech and maple timber, which always denotes the best wheat lands. The Flint and Pere Marquette road and the Jackson, Lansing and Saginaw road have also opened fine tracts of farming and lumbering lands. For those who desire to locate upon timber lands, these are very attractive, having the same climate as that of Western Canada and being equally fertile. In addition to their agricultural value, the timber upon these lands, in most cases, will more than pay for clearing them, and leave the land free of cost. A large quantity of these lands are for sale by the above roads at moderate prices.

Sugar-Making Machinery.—"Sugar Maker." The sugar-making machinery made by Geo. L. Squier & Bro., of Buffalo, is adapted to the use of either the smallest or the largest planter. For making maple sugar or syrup from sorghum, their "American Evaporator" with portable furnace will be found very suitable. They also make a very strong horse-power, called the Sampson, for the purpose of driving the mills for crushing cane or for other purposes. Their machinery has taken first premiums wherever it has been exhibited, from Louisiana to New York.

Calendar for March.

Table with columns for Day of Month, Day of Week, and sunrise/sunset times for Boston, N.Y., Philadelphia, and Washington.

PHASES OF THE MOON.

Table showing moon phases (Full, 3d, New, 1st) for Boston, N.Y., Wash'n, Phila'ston, and Chicago.

AMERICAN AGRICULTURIST.

NEW YORK, MARCH, 1874.

Said a large iron manufacturer to us a few days ago: "I have been visiting some of the principal factories, in company with our foreman, to see what new and improved processes are adopted. We have picked up many ideas that will be of great use to us. Time was when we could get high prices for our products, but now the manufacturer must study the closest economy. Our profits come from what we can save by adopting the best processes."

This seemed to be a new idea to him. "Farmers," we remarked, "have always had to practice the closest economy. There is no business in which there is so much competition. We have long known that we must look to our profits by cheapening production."

We fear, however, that we elaimed more for farmers than we are justly entitled to. Farmers are personally economical. As a rule, they do not spend too much on themselves or their families. But are we truly economical in our farm management? Do we spend our time and labor to the best advantage? Are we getting full returns from our horses, cows, sheep, and pigs? They are eating every day, and cost us a large sum in the aggregate for food and attendance. If we take a load to market and come back empty we are losing half our own time and nearly half the powers of the team. If we set a man to plow, harrow, or cultivate with one horse when the work requires two, we are losing half the man's wages. If he uses two horses when three are required we lose one-third of his labor. It is a good time to think about these things, and make preparation for performing our work with the least loss. We hope no reader of the Agriculturist will let the present month of comparative leisure go by without doing everything that can be done to facilitate the labors which will press upon us in a few weeks.

Hints about Work.

Hire Men for the Season.—Wages will be lower. But if you can find a good man pay him what he is worth. Let him feel that it is getting good pay for good work. Cottages for farm laborers are much needed; they save much labor in the farmer's house.

The Farmer should Own the Cottage, and let the rent apply on the wages. If you rent the cottage you have no hold on the man. But if you let him have the house as part of the wages you can turn him out for disobedience or for any reason sufficient to legally justify you in discharging a hired man.

A Married Man should, however, be treated with great forbearance. It is a cruel thing to turn a family out of doors. If the man is getting careless, let him know that you have this power, but do not exercise it except in extreme cases.

Day Men can usually be obtained early in the spring at comparatively low wages. We had men willing to work on our own farm in March for half what the same men ask in May, June, and July.

The Days are Getting Longer.—We do a great deal of work in October and November, and pay very high wages. But the day is longer in February (say 10.40) than it is in November (say 9.55), and longer in March (say 12.17) than in October (say 11.07); in fact, nearly as long as in September (say 12.28). If we have any work that can be conveniently done, therefore, we can not only get men at low wages, but the night does not come so soon as in October.

Write Down everything you have to do during the next four or five months; and then see if there is not something that you can do now that will save time and labor.

If you are going to Build, cut and hew the timbers and draw them where they are wanted. Draw the lumber while there is sleighing.

Keep the Teams at Work.—Better hire an extra man than let the horses lie idle.

Draw Wood, and saw and split and pile up in the wood-house all you will want until next winter.

Green Cord-wood should be drawn and put in a pile to season. Do not let it remain in the woods, and then have to draw it in the summer when you should be doing more important work.

Draw Plaster, and sow it direct from the sleigh or wagon or stow it away in a dry place. It will not injure by keeping, unless it gets damp and lumpy.

Draw Manure to the field where needed and put it in a pile to ferment. If some portions of the manure are wet and some dry mix them together in the new pile.

Cut up Hay and other Fodder with a horse-power machine and stow it away for future use. Scatter a little salt on it, say at the rate of two quarts to a ton.

Damaged Hay should be cut up and steamed. Molded hay is very injurious unless steamed or moistened with boiling water to destroy the fungus.

A Good Grindstone is a necessity on every farm. If you have a horse-power or a wind-mill it will pay well to attach a driving-wheel to your grindstone. You can then grind coulters, cultivator teeth, axes, spades, hoes, hay-knives, scythes, cradles, corn-cutters, cold-chisels, and anything and everything you will be likely to want during the coming busy season.

Put everything in perfect repair.—See Hints for last month. If you are near a blacksmith and wheelwright's shop you can probably get the work done cheaper and better than by doing it yourself. But when you have to send several miles there are many little things that can be repaired at home in less time than is required to take them to the shop.

A Chest of Tools and a Tool Shop will pay for themselves every year, provided you keep the tools in good order and in their proper places. This is the age of machinery, and every farmer should be more or less of a mechanic.

Clean Out Stables and Barns and leave no cobwebs. If you are a slovenly man and do not know how to "tidy up," get your wife to show you how.

Push things the coming season. Times will be better. Produce will be higher. Raise all you can and get ready for the work now. Be hopeful, energetic, systematic, and industrious, and you will find farming pleasant and profitable.

Keep Out of Debt.—It is better to work for some one else than to pay 12 or 15 per cent for money.

Animals need special care this month. The weather is often changeable. We have sometimes a rain-storm that will drench even a sheep to the skin. Nothing can be more injurious to sheep unless it is a close, damp, dirty basement stable.

Sheep will stand severe cold, but they should always have shelter from winds and rain. If they must be exposed to storms feed more grain.

Ewes in Lamb should have as much exercise as they can be induced to take. Be careful that they do not crowd each other in going through doors or gates. Do not feed musty hay. A moderate allowance of bran is desirable, but not enough to scour them. We find no ill effects from feeding large sheep one pound each of bran per day. If in high condition give no grain, but if thin or they are exposed to storms from a half to one pound each per day of oats or corn will be very beneficial.

Put Sheep are generally sold to good advantage this month.

Ewes Suckling Lambs should have the best of care and feed. Bran, mangel-wurzel, and clover hay will favor the production of milk. A little oat-meal, corn-meal, or bran stirred into the water they drink is excellent.

The Lambs if strong and healthy will begin to eat a little when two or three weeks old. Let them have a small trough with a little bran, or oil-cake, or oats, or sliced mangels separate from the ewes.

For Scours in young lambs we usually give a teaspoonful of castor-oil and from three to five drops of laudanum. Magnesia or prepared chalk is good. For mild cases in older lambs or sheep there is nothing better than milk porridge made with fresh milk and wheat flour. Make it as you would if for yourself and give from half a pint to a pint to each.

Cows in calf should have plenty of food and exercise. For three or four weeks before calving give sufficient flaxseed, bran, or oil-cake to keep the bowels moderately loose. If the cow is in high condition it is well to give from a half to one pound of Glauber's-salts once a week for a month previous to calving. Two table-spoonfuls of ginger is a desirable addition to the drench.

After Calving keep the cow in the stall for three or four days, give warm bran mash. Let the cow have all the water she will drink, but take the chill off of it. If the cow is in low condition and the placenta is not discharged give tonics such as oat or corn-meal gruel, bran mash, flaxseed tea, or a pint of warm ale. The placenta may be sometimes easily removed by taking it in the hands and gently twisting it as you would a rope. Keep twisting without pulling till it comes away.

Milking Clean is very important. It is sometimes a good plan to draw all the milk you can get and then let the calf remain with the cow for an hour or so. It will milk clean.

Horses that have been nearly idle all winter should now be worked moderately and fed better. Do not expose them to cold storms. Be careful to blanket them when they have to stand when heated. Clean thoroughly. See hints for last month.

Swine are now attracting renewed attention. The prospects for breeders and feeders are encouraging. This stock is worthy of better care than it usually receives.

Little Pigs will come by the million this month and the next, and as usually managed will die by the thousand.

The Sow for a week or so before the pigs are expected should be placed in a warm, dry pen by herself. Give light, sloppy food. If costive give her a pint of flaxseed boiled for two or three hours in half a pail of water. Give this once a day with bran till the bowels are loose. When pigs come in cold weather our own plan is to cover the sow with a horse blanket and keep the little ones at the teats under the blanket. We have saved many pigs by this simple plan. Feed the sow warm bran mash for a week with slops from the house, and afterwards give richer feed.

Work in the Horticultural Departments.

The winter up to the time of writing has been so mild that many out-of-door operations could be carried on, and all who were so fortunate as to take advantage of this weather, will find a great difference in their spring work. March is usually such a blustering month that there is not much pleasure in outside work, but every mild day should be turned to account if there is much still undone. Manure can be composted and earted out while the ground is hard at a less expense than later in the season. See that all the labor needed is provided for early, as the earlier a man is obtained in the spring the better is the chance of securing a useful one. Labor at this season is more abundant and cheaper than it will be later.

Orchard and Nursery.

Nurserymen will soon commence to send out stock, and all who have to procure their trees from a distance ought to send their orders at once. If delayed until the trees are wanted, the stock of many of the best varieties will often be exhausted. When the trees arrive unpack at once, and if the ground is not prepared for planting out, heel in in a dry spot until needed. When ready to plant the tops should be cut back at least one third, and the branches shortened, to compensate for the loss of roots in removing from the nursery. If any

Shrivelled Trees are found bury the whole tree in the ground for a few days, and the bark will usually assume its plump condition.

Girdled Trees should be treated as recommended last month.

Grafting.—Cherry and Plum trees should be grafted earlier than apple and pear trees.

Pruning.—Continue to prune while vegetation is dormant, taking care to cover all large cuts with melted grafting-wax, shellac varnish or paint. A good mixture for grafting-wax is with three parts beeswax, three parts rosin, and two parts tallow; melt and mix the whole well together.

Cions.—Cut as long as the sap continues dormant, and preserve as before directed.

Fruit Garden.

Most of the directions given under the orchard and nursery will apply here.

Raspberries.—Set as early as the ground will allow, in rows from four to six feet apart, according to the variety. If the old canes were not cut away in the fall, remove now, before the new growth commences.

Blackberries ought to be planted early, before they commence their growth, as they are liable to be injured if moved after they have started. Six feet apart is sufficient if all suckers are kept out, and the branches pinched back during growth.

Currants.—Make cuttings of such varieties as are wanted, and plant four inches asunder in rows two feet apart, taking care to press the earth firmly around the base of the cutting.

Grape-vines.—Plant as soon as the soil is in proper condition, using no manure. Cut back the canes to three eyes, only one of which should be allowed to grow. Plow old vineyards and apply a dressing of coarse ground bones. Posts for trellises may be set whenever the frost is well out.

Strawberries.—Plant out new beds and remove all runners not wanted for planting from the old beds. Set the plants in rows two feet apart, and eighteen inches in the rows. Mulch with leaves or cut straw to keep the newly-planted beds from drying out during the summer, and upon old beds to promote growth and keep the fruit clean. Use well-rotted manure before setting out plants.

Kitchen Garden.

It has been our custom to give the names of the standard varieties of vegetables in the March number of the *Agriculturist*. From this list, those who

are entirely unacquainted with the best sorts for general use, will be able to select varieties that have been well tested. They will find numerous other sorts in the catalogues.

Early Plants.—The simplest way of securing early plants, where but a few are required, is to start them in window-boxes. These ought to be three or four inches deep, and filled to within half an inch of the top with fine, light, rich garden soil. For raising plants largely, of course they must be sown in a hot-bed.

Cold Frames should be looked after carefully, and plenty of air given when the weather is mild, or else the plants will become drawn. Give water only when the soil appears dry.

Novelties.—Every year our seedsmen offer novelties in their catalogues. These are often no better than older kinds, but now and then one finds a treasure, and the trial of novelties is an interesting part of gardening to those who can afford time and money. Some of the most promising novelties of this year will be found on page 102 of this number.

Asparagus.—Old beds that were top-dressed last fall should have the litter raked off and the fine manure forked in between the plants. Set out new beds with one-year-old plants. The old way is to make the rows 18 inches apart, with the plants 9 inches apart in the rows. Our market growers give more room, setting the plants two feet or more apart each way. Set the plants four inches below the surface. Conover's Colossal is a reliable variety.

Beans must not be planted until all danger of frost is passed. Sow Early Valentine and Dwarf Wax for early bush in rows two feet apart. Giant Wax and Large Limas (when the season is long enough) are the best pole sorts for general use.

Beets may be sown as soon as the frost is out of the ground, as they will bear considerable cold after they have been planted. Sow thickly in hills one foot apart; the thinning can be used for greens. New Egyptian Blood is the best dark early sort, Bassano light colored but early; Long Blood late.

Broccoli.—Sow and treat the same as recommended for cabbages. White or Purple Cape.

Cabbage Plants wintered in a cold-frame may be set out as soon as the ground can be worked. Jersey Wakefield and Early York are best early; Early Winnigstadt medium; Drumhead, Flat Dutch, and Late Bergen should be sown in open ground for late crops. Sow seeds in hot-bed and cold-frame for second early. There are always little spaces in a garden where a few cabbages may be put; a plenty of plants should be provided.

Hot-beds.—This month will be the proper season for making hot-beds at the North. Select a dry, sheltered spot with a southern exposure if possible, and dig a pit of the required size to a depth of eighteen inches to two feet; this pit ought to be at least a foot wider and longer than the frame used, and be boarded up with any old boards. Fill with horse manure to the height of at least six inches above the surface of the ground, tramping it down firmly. Make the frame of inch hemlock boards two feet high at the back and one foot in front. After the manure has been put in place a layer of three to six inches of good light and rich garden soil on the manure. Bank up with earth around it; put on the frame; put the sashes on and let them remain for two or three days, or until the heat is reduced to about 90°, when the seeds may be sown. Sashes are usually 6x3 feet, but other sizes will answer. During cold nights cover with mats or shutters to keep the plants from freezing.

Cold Frames are made in the same way as hot-beds, except that no manure is used; the frame is put upon a spot where the soil is rich and carefully prepared. Stir the soil often until it is thoroughly warmed by the heat of the sun, covering at night to retain the warmth, and then sow the seeds of such plants as do not require strong heat, such as cabbage, lettuce, etc.

Cauliflower.—Treat the same as cabbage, sowing

Early Paris and Early Erfurt for early. Lenormand and Walcheren for late.

Carrots.—Early Horn is best for early, and in the garden best also for late; sow in drills one foot apart.

Celery.—Sow in hot-beds Dwarf White Solid and Boston Market.

Chis.—Cut away the dead tops early. To make a new bed procure a clump and divide it; set the single plants or small clusters in rows a foot apart, allow six inches between them. The tender green tops are cut up fine and eaten with vinegar.

Corn.—As soon as the ground is warm enough plant a few rows of Moore's Concord or other early. At intervals of ten days sow this and later Mexican Black but the sweetest, Mammoth Sweet, and Stowell's Evergreen. Sow in drills 2 1/2 feet apart.

Cress.—Sow Curled in shallow drills, one foot apart at intervals of a week.

Cucumbers.—A few hills of Early Russian may be planted on pieces of sod in a hot-bed; for general crop White Spine, and for late and pickles Green Prickly.

Egg Plant.—Sow seeds in the hottest part of the hot-bed; they require more heat than most plants. Long Purple for early, and Purple and Black Skin for late.

Horseradish.—Plant sets in rows two feet apart in well-manured ground.

Kale left in from last fall will need hoeing to keep down the weeds and promote growth. German Greens and Scotch kale are sown late.

Kohl-rabi.—Sow Early White in open ground in drills two feet apart.

Leek.—Sow Flag or Musselburgh the same as onions.

Lettuce sowed in the open ground last fall must be uncovered and the soil loosened between the rows. Set out plants from the cold-frame, and sow seeds in hot-bed and open ground. Curled Miesia, Hanson, and Tennis-ball are reliable sorts.

Melons.—Treat the same as cucumbers. Nutmeg, Cassaba, Skillman's Netted, White Japan, and Ward's Nectar are good.

Onions.—Sow early in very rich soil in drills fifteen inches apart. Plant out sets, potato, and top onions for early crop. Yellow Dauvers and Early Red are the best sorts for raising from seed.

Parsley.—Soak seeds in warm water, and sow Curled in drills one foot apart.

Parsnips.—Dig those left in the ground over winter, and sow seeds of Hollow Crown in drills fifteen inches apart.

Peas.—Plant over well-manured trenches in double rows, allowing room enough between the rows to place the brush. Laxton's Alpha, Carter's First Crop, and Daniel O'Rourke for early; Champion of England or Yorkshire Hero for main crop. For dwarf McLean's Little Gem. Sow the last in single rows eighteen inches apart, and not until the ground is well warmed.

Peppers.—Sow in hot-bed as egg plant. Squash for pickles and Sweet Mountain for stuffing.

Potatoes.—Start a few for early use in hot-bed. Those for planting in open ground may be cut and placed in a warm spot for a few days before planting. Early Rose is best for general crop of early. See notices of new sorts.

Radishes.—Sow thickly in drills in open ground at intervals of a week or ten days for a succession. French Breakfast, Early Scarlet Turnip, and Olive-shaped short sorts, and Scarlet Short-top long.

Salsify.—Dig the roots remaining in the ground, and sow seeds for the new crop as for parsnips.

Scorzoneria, or Black Salsify, requires the same treatment as salsify.

Spinach.—Uncover the beds planted last fall, and in a few days of warm weather it will be ready to cut. Sow seeds of Round Leaved in drills a foot apart for spring and summer use. New Zealand is best for summer, but is not sown until May.

Sorrel.—Uncover the plants and spade a dressing

of manure between the rows. It is excellent for early greens.

Sweet Potatoes.—Start in a hot-bed with two or three inches of compost over them, and when the sprouts are large enough, set in well-manured ridges. Nansemond and Southern Queen are best for Northern use. See article on page 89.

Squashes.—After the ground is warm sow Summer Crookneck for early; Boston Marrow, Marble-head, and Hubbard for late.

Tomato.—Start in hot-bed or window-box seeds of Trophy, Early Smooth Red, and Canada Victor.

Turnips.—Sow a few rows of Flat Dutch for early, and Red and White Strap-leaf for later. White French and Yellow Stone for ruta-baga sorts.

Seeds.—The supply of seeds should be ordered at once, so that they may be ready when wanted. The facilities for sending seeds by mail are now such that all the smaller varieties can be sent easily and cheaply by mail.

Flower Garden and Lawn.

Annuals.—Sow in hot-bed or window-boxes, so that there may be plenty of young plants to use in planting the borders.

Walks may be made as soon as settled weather comes; gravel and broken rock make the most durable walks.

Lawns.—Roll and sow plenty of grass-seed where the turf was injured during the winter. When new lawns are made prepare the soil by plowing or spading in well-rotted manure. Red Top or June Grass makes a good lawn when used alone, or both together, with a little white clover. Use plenty of seed, five or six bushels to the acre.

Perennials grow better if divided at least once in three years. Attend to this as early as possible before growth commences. If the soil is not already rich, make it so by adding plenty of fine manure.

Greenhouse and Window Plants.

March will bring with it an abundance of work in this department, the chief of which will be the

Propagation of bedding plants for out-of-door planting. The temperature of the air in the propagating house must be considerably lower than that under the benches.

Ventilation ought to be looked after carefully now that the sun is so powerful. Admit air every mild day, taking care however that none of the plants are exposed to draughts of air. Keep the plants near the glass, so that they will get all the light possible.

Smoking.—The greenhouse should be fumigated with tobacco smoke every week to destroy the green fly. If one smoking is not enough give another the next evening, always taking care to thoroughly syringe the plants the next day to remove the dead insects.

Forcing.—Such plants as were forced during winter should be turned out in a reserve bed to recover.

Bulbs that have finished flowering should be allowed to complete the growth of their leaves: after this cut off the leaves and store the bulbs in a dry place, where they can not be injured by cold or mice.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, from our daily record during the year, show at a glance the transactions for the month ending Feb. 13th, 1874, and for the corresponding month last year:

Table with columns: RECEIPTS, FLOUR, WHEAT, CORN, RYE, BARLEY, OATS, SALES, and corresponding values for 1874 and 1873.

Comparison with same period at this time last year. RECEIPTS: Flour, Wheat, Corn, Rye, Barley, Oats. 26 days 1874 vs 1873.

Stock of grain in store at New York. Wheat, Corn, Rye, Barley, Oats, Malt. Feb. 9, 1874 vs Feb. 9, 1873.

Exports from New York, Jan. 1 to Feb. 12. Flour, Wheat, Corn, Rye, Barley, Oats, Peas.

CURRENT WHOLESALE PRICES.

Table of current wholesale prices for various commodities like Flour, Wheat, Corn, etc., with prices for Jan. 13 and Feb. 13.

Gold has been up to 112% and down to 110%—closing February 12th at 112% as against 111% on January 12th. The receipts of Produce since our last have been on a remarkably liberal scale for the season—the railways bringing forward unusually large amounts, particularly of Flour, Wheat, and Hog products.

rather sharply. Wool has been in fair demand, mostly on manufacturing account, at stronger rates. The finer grades of Fleeces have been scarce. Hemp, Seeds, Hay, and Tobacco have been moderately sought after at the ruling prices. Naval Stores and Petroleum hold higher, and in more demand. A very moderate business has been reported in Hops, at essentially unaltered rates. Groceries have been sought after—Coffee and Sugars lower. The Cotton movement has been comparatively brisk; but with free offerings of stock prices have declined.

New York Live-Stock Markets.

Table with columns: RECEIPTS, WEEK ENDING, Beeves, Cows, Sheep, Swine, Total. Rows include weekly receipts and totals for 4 and 5 weeks.

Receipts.—After the dull course of last month's business the usual reaction took place, and a firm and upward feeling was manifested. The receipts during the month were irregular, and prices worked back and forth exactly according to receipts. On the whole, the past month has not been satisfactory to dealers, and some have lost money. At the close the market was dull, and prices were easier for ordinary and medium cattle, 1/2c. 1/2 lb. having been lost from the top rates of the day. Cherokee and Texan cattle brought 9 1/4c. @ 10 1/4c. 1/2 lb. to dress 56 lbs. 1/2 gross cwt.; prime native brought 8 1/2c. @ 12 1/2c. on 54 @ 58 lbs.; and a few of the best reached 12 1/2c. @ 13c.

Table with columns: WEEK ENDING, Range, Large Sales, Aver. Rows include weekly price ranges and averages for various livestock.

Milk Cows.—The market for cows has been quiet. All that came to hand have been sold at steady prices, and a moderate demand is reported at \$40 @ \$80 per head. Calves.—A steady demand exists for all that arrive, and good veals are taken readily at highest quotations. At the close, 8c. @ 11c. 1/2 lb. was paid for veals, and \$8 @ \$12 per head for grass calves. Hog-dressed veals were firm at 11c. @ 14c. 1/2 lb. Sheep and Lambs.—An increase in receipts, although trifling, has disturbed the market for sheep, and along with the weakness there has been a falling off of 1/4c. 1/2 lb. Choice lots bring high prices, and 8 1/4c. 1/2 lb. was paid at the close for this class of stock. The range was 6 1/4c. @ 8 1/4c. 1/2 lb. Swine.—The market has gradually crept up, and, with lighter receipts, quotations are considerably advanced. Live hogs sold at the close at 6c. @ 6 1/2c. 1/2 lb. Dressed hogs were in fair demand, at 7c. @ 7 1/2c. 1/2 lb. for Western, and 7c. @ 8c. 1/2 lb. for City.

Clubs can at any time be increased by remitting for each addition the price paid by the original members; or a small club may be increased to a larger one; thus; a person having sent 10 subscribers and \$12, may afterward send 10 more subscribers with only \$8; making a club of 20 at \$1 each; and so of the other club rates.

Mr. Judd's Health.—A paragraph has been going the rounds of the papers to the effect that Mr. Judd is seriously ill. This was news to us, who are quite as likely as other papers to know, and we can only say that his last and very recent letter was very cheerful, without any reference at all to his being ill.

Our Fine Chromos.—Read all about them on third cover page. It is easy to secure one or both.

New for the Senate!—The House has passed a much needed amendment to the Postal law, which interests all who send books, plants, and other matters by mail. When it becomes a law we shall endeavor to publish it in full.

Take Both Papers.—If both the American Agriculturist and HEARTH AND HOME are taken together they may be had for only \$4, and \$4.50 pays for both papers and a Chromo with each.

Grafting the Hickory.—"C. R.," Locktown, N. J. The hickory is among what the French gardener calls "sujets rebelles," or hard cases; and to graft it successfully requires great care on the part of the operator. At best it only succeeds on very young stocks, and the grafts when set have to be covered with a bell-glass to keep them from drying out, and a shade to prevent burning. Grafting the hickory may be considered, so far as people in general are concerned, as impracticable. A few years ago we published a communication from a gentleman who succeeded by drawing the earth away from small stocks, grafting in the collar by the usual cleft-graft, tying firmly, replacing the earth, and making a mound of earth to half cover the cion.

Death of a New Hampshire Horticulturist.—Mr. Calvin Eaton, of Concord, N. H., died suddenly of disease of the heart on January 14th. Mr. E. was prominent in the horticulture of his State, and was especially successful as a grape-grower.

Walks in a Lawn.—"J. T. P.," Chester Co., Pa. The walks in Central Park are made of various materials. The best, except on hill-sides where they will wash, are made of gravel, and if good gravel can be had and properly laid nothing can be better. The cement walks, so far as we know of them, are hampered with patents. One of our neighbors made his walks by melting three parts of coal-tar and one of pitch, mixing sand with this material to make a thick mortar, and spreading and rolling. This makes a good walk; but we do not know whether it interferes with any one's patent or not.

Triumph Sweet Corn.—A single trial of this variety convinced us of its great excellence, and we regard it as "tip-top" in every respect. Mr. D. C. Voorhes, Blavensburg, N. J., who brought this corn to its present perfection, has furnished us enough for a more extended planting this year, and we shall make another trial of it.

A Camellia with Two Centers.—Mr. David Foulis, Florist, 1466 Broadway, N. Y., brought us a camellia which had two distinct centers in the middle of the flower, while the exterior shows no indication that it was formed by the union of two flowers.

The English "Farmer"—not the tiller of the soil, but the paper absurdly so-called—continues to act out its natural instincts, and (in such a case it is not necessary to be very choice of words) steal from the Agriculturist and other papers with its accustomed freedom. If the articles thus stolen went no further than the obscure columns of the "Farmer," it would matter but little, but other English as well as American papers, seeing a good article in the Farmer, quote it and credit it to that sheet, and thus a double wrong is done—it steals articles and gets credit for publishing something readable under the false pretense of its being original. Our friend Robinson, of the "Garden," recently published, with credit to the Farmer, an article on "Carpeting Beneath Shrubs," copied from the Agriculturist word for word. The Garden should know that if anything appears in the Farmer worth quoting, it is quite sure to be stolen bodily from the Agriculturist or some other American paper, for nothing short of a stroke of lightning would ever arouse it from its profound stupidity and in-

duce it to perpetrate a readable article of its own. A burglar shows some daring in his crime, the pickpocket displays great skill, but the fellow who steals the coats from the hall while the family are at supper shows neither daring nor skill, and we call him a "sneak thief." A paper that persistently and continually takes others articles without credit does not belong to the first two classes, as his exploits are not marked by either of the qualities that we have attributed to them.

SUNDRY HUMBUGS.—Important Decision.

Many years ago, Mr. Judd found, from his correspondence, that quacks and charlatans of all kinds were fleecing the people, especially the agricultural community, at a rate that was perfectly astounding. He, at a great expenditure of time and at the risk of both person and pocket, began to investigate the complaints that came to him, and, when well founded, the evil-doers were exposed. Soon the humbug column became a regular thing, and it became necessary to employ assistants to look up the cases as they occurred. For a long time he fought the army of humbugs single-handed, though of late other papers have given more or less efficient aid; and it is satisfactory to know that the Agriculturist has been the means of saving to the people a sum that may safely be reckoned by millions. Whoever has had the editorial charge, the manifesto against fraud has regularly appeared, and it is intended it shall appear until the rogues find the business has grown unprofitable from their being unable to find dupes. A great help to our labors has come in the recent United States law against improper use of the mails; and we are by this enabled to squelch some very mischievous things in the end. It is not policy to tell how this is done, as we do not care to put rogues on their guard. Suffice it to say it is through the officers of the law. In exposing the designs of quacks and impostors of all kinds we may sometimes make a mistake, and do injustice to an innocent person, notwithstanding all the care we take in investigating and considering each case. The cases in which this has happened have been very rare, and we have hastened, when convinced we were wrong, to make the fullest reparation. We would not in any manner injure any one engaged in a fair and legitimate business, but, on the other hand, we will not allow those in unfair and illegitimate business to fleece confiding and unsuspecting people if any warning on our part can prevent it. Of course, in defending thousands from the designs of quacks and impostors, we must offend those who get up the swindling schemes, and some of these have money enough to enter a suit at law against us. We get "handed up" so often that we have become quite used to it; and though these fellows have it in their power to cause us to expend time and money to respond to their suits, we accept these as legitimate accompaniments of our position. Some prosecute us with the hope that the fact may be widely announced, and thus give them a capital advertisement gratis; others enter suits with the expectation of recovering damages. When we are sued we do not publish the fact, as we do not care to do that kind of advertising. Very few of these suits ever come to trial, and in the few that have been fairly brought before the courts, we have in no case been defeated. The last suit that was brought against us called forth such a positive opinion from Judge Davis of the Supreme Court of New York, that we are induced to print it in full. It is, indeed, a valuable contribution to medico-legal literature, and is of interest not only to the people at large, but to every publisher of a journal and every lawyer and physician. Nor is it without importance to makers and vendors of various nostrums; and this very calm bit of judicial wisdom is commended to their consideration. This opinion, copied from the court record, gives such a full and clear history of the case, that no further comment is needed.

SUPREME COURT.—FIRST DEPARTMENT. JANUARY GENERAL TERM.

DAVID RICHARDS, Plff. and Appt., vs. ORANGE JUDD AND OTHERS, Defs. and Resp. DAVIS, P. J. DONOHUE and DANIEL, J. J.

Appeal from order of Special Term, striking out the complaint in this action, and dismissing the same with costs, for plaintiff's refusal to answer certain questions propounded to him as a witness pursuant to the order of the Court.

JOHN L. WALKER for plaintiff; AMOS G. HULL for respondent.

DAVIS, P. J.: The plaintiff alleges in his complaint, in substance, that he is and has for many years been the sole proprietor, owner, and manufacturer of articles of medicines and merchandise generally and publicly known as Dr. Richan's Golden Remedies, which he has for ten years last past manufactured and put up and offered for sale

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money: — Checks on New York City Banks or Bankers are best for large sums; make payable to the order of Orange Judd & Company. Post-Office Money Orders for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

Postage: On American Agriculturist, 12 cents a year, and on Hearth and Home, 20 cents a year, in advance. Double rates if not paid in advance at the office where the papers are received. For subscribers in British America, the postage, as above, must be sent to this office, with the subscription, for prepayment here. Also 20 cents for delivery of Hearth and Home and 12 cents for delivery of American Agriculturist in New York City.

The National Live-Stock Journal, which is a monthly journal published at Chicago, continues very worthily to represent the interests of stock breeders; it is thoroughly trustworthy, and is edited with great judgment and skill. It now comes forward as the defender of stock interests, being engaged in repelling an attack in the shape of a suit for damages for an expression of opinion upon matters of great moment to honest breeders.

and sold, and that by means of extensive advertising and the good qualities of such Golden Remedies he has secured large sales and profits.

He also alleges that the defendants are publishers of a monthly magazine known as the *American Agriculturist*, and having a circulation monthly of two hundred and fifty thousand copies; that in November, 1872, the defendants published in their said magazine a certain libelous article in the following words: "Sundry Humbugs.—Our newer readers keep inquiring about the trustworthiness of this, that, and the other doctor for various diseases. We answer that every so-called physician, every medical institute or college or association that advertises medicine or medical advice, by circular or otherwise, is a quack—in short, a swindle. The whole tribe of those who advertise 'marriage guides,' 'female medicines,' 'advice to the young,' 'errors of youth,' 'eye doctors,' 'ear doctors,' 'consumption cures,' 'cancer doctors or medicines, etc., etc., are positively quacks and impostors, to whom it is unsafe to address even a letter of inquiry; also the 'Golden Remedies' inquired about by several are nonsensical quackery. We have not room for a lot more of humbugs on hand, but will renew the war upon them in the next volume, and, as hitherto, we expect to shield at least all our readers from swindlers, and through them many other people."

The plaintiff alleged also that the defendants, by means of these words published as hereinbefore set forth, insinuated and meant to be understood by those to whom it was published and to the public at large, as charging the plaintiff with being a quack, impostor and swindler, and that the said "Golden Remedies" manufactured solely by the plaintiff were wholly valueless and useless, and possessing no medicinal qualities whatever, and that by means of the publication the plaintiff has been injured in his reputation and in his business, and been deprived of custom and trade, and lost the sale of goods and profits which he would otherwise have made, to his damage, twenty-five thousand dollars.

The defendants in their answer admit in substance that they are publishers of the *American Agriculturist*, and that in December, 1872, they published the article under the caption of "Sundry Humbugs," above set forth. They allege also that the publication is substantially true, and was published with good motives and for justifiable ends. They also set out *in extenso* the circulars sent forth by the defendant with his "Golden Remedies," in which the plaintiff describes himself as a physician who has had a general practice in all parts of the world; and aver various facts tending to show that the alleged medicines of plaintiff are valueless as remedies for disease, being compounds costing but a few cents per bottle, and selling at several dollars, which the public would shun if the constituent facts were known.

The defendants propose in their answer to give evidence of all the various facts alleged both in justification and in mitigation of damages.

Issue being joined, the defendants upon affidavit procured an order and summons for the examination of plaintiff as a witness on their behalf before the trial.

On such examination the plaintiff testified that a bottle marked "Doctor Richan's Golden Remedy, No. 2," was one of the medicines he advertises and vends to the public.

He was then asked of what Balsam No. 2 is composed. He refused to answer the question, on the ground that it was irrelevant, immaterial, and a secret in his trade.

The judge directed the plaintiff to answer the question.

He then answered: "It is a secret compound composed of various ingredients which possess great medicinal properties," and refused to state the names of the ingredients.

He then gave evidence showing that he was not a doctor of medicine and had never received a diploma, and had not been engaged in a general practice of medicine in any part of the United States.

He then testified that he advertised "Doctor Richan's Golden Elixir de Amour, or Elixir of Love," and on being asked "of what is it composed?" he refused to answer.

The Court at Special Term, after argument, ruled that the plaintiff must answer the question which had been propounded; and on the question being repeated to him he answered: "It is a secret compound of various ingredients which possess great medicinal properties," and refused absolutely to give any other answer.

On presentation of these facts to the Court it was held that the answer was evasive; and the plaintiff, under the advice of his counsel, refusing to give any other answer, the Court ordered his complaint to be stricken out and dismissed with costs.

By the allegations of his complaint the plaintiff had invited an issue as to the medicinal qualities and value of the "Golden Remedies."

The statement of the alleged libel, so far as it pointed directly to plaintiff or his remedies, was to the effect that his "Golden Remedies" are "nonsensical quack-

ery," and it is chiefly of this statement that the plaintiff complains.

The defendants undertake by their answer to show that this statement is true.

No one can read the circulars of the plaintiff, as proved by himself on his examination, without observing the importance of the investigation sought to be made. It was competent to disprove the assertions of the circulars and of the complaint by ascertaining the ingredients of the several compounds for the purpose of showing that they possess no such medical virtues as are claimed by plaintiff. For instance, he asserts in his circular that his "Elixir of Love is composed of the most powerful ingredients of the vegetable kingdom—harmless, but speedy in restoring healthy action." And again: "It is the fountain of youth to old age, the rejuvenator of pristine vigor in the young; to the barren woman of our land it is a special blessing." Indeed, it is impossible to read the vulgar and in many respects shameful assertions and instructions that accompany the compounds of plaintiff without being struck with the vileness of the impostures. That he can bring an action of libel for injury alleged to be done to his trade in his medicines by denouncing them as arrant quackery, and at the same time protect himself against exposure by claiming them to be valuable secrets, is a proposition that can not be maintained. *Byrn vs. Judd*, 11 Abbott, New Series; 11 New York, 347, New Series.

In the laudable exposure of such "humbugs" as the pretended medicine of plaintiff and others, the defendants take upon themselves great risks, and subject themselves to the annoyance of suits; but I think they are not exposed to any danger that courts will interpose any shield for the protection of parties guilty of fraud and deception of the public.

If the plaintiff did not choose to try the question of the true character of his "Golden Remedies" he should have kept out of a court of justice.

The order of the Court below was correct, and should be affirmed with \$10 costs and disbursements.

In view of the length of this opinion, we must let the bulk of our budget of humbug literature rest for this month. It presents some new schemes, but all in the old style, save one or two novelties that we are investigating. It will be timely to advise our farmer readers not to invest in "Ivory" or any other wheat at \$1 for 100 grains. A variety possessing such qualities as this does not first make itself known through an obscure circular. As it came from Africa, we suspect it is not a wheat at all. . . . If people will send money to "Furnishing Companies" in Chicago or elsewhere and get no returns, we can only say to the gentlemen who write from Missouri and Wisconsin that we regret they did not read their *Agriculturist* more thoroughly. We can not comply with the request of our correspondent who requests us to put him on our "list of fools." He had better pocket his loss and take the lesson to heart.

Roses by Mail.—Massey & Hudson, Florists, Chestertown, Md., in sending us one of their packages of roses, say they "would like to call your attention not only to the plants themselves, but to the box and manner of packing, both of which we claim as original, and which for simplicity, light weight, and effectiveness, we don't think can be beaten." Well, that is just what we think. If one can get eight vigorous, well-rooted young roses delivered in any part of the country for \$1, we think we should be a rose-growing people, which we are not.

Pupils in Horticulture.—We often have applications from those who wish situations to learn gardening in its various branches; but such places are difficult to find. We now know of a gentleman upon whose place—a private one near New York—most of the operations of horticulture are carried on. He offers to take a student, provided a suitable young man offers. None need apply but those who have a positive liking for horticulture and are fond of both study and work. Address, stating age and previous experience, "Horticulture," at this office.

Sebright Bantams.—James Shepard, of Bristol, Ct., sends us portraits of these beautiful pet birds, which he breeds to great perfection, as he does other choice fowls.

Ohio Dairymen's Association.—The tenth annual meeting of this association was held in Cleveland on the 25th and 29th of January. The number of members is 134, and \$136 were received into the treasury last year. The usual matters connected with dairying were talked of and discussed, and W. A. Jenkins, of Portage, was chosen as President, and S. D. Harris as Secretary and Treasurer for the ensuing year.

FREE.—Fine Gold Pens, with Silver Cases—The Best Silver-plated Table Articles—Table Cutlery—Children's Carriages and Toys—Floral Sets—Garden Seeds and Flower Bulbs—Sewing Machines—Washing Machines and Wringers—Pocket Knives—Fine Gold and Silver Watches—Melodeons—Pianos—Guns and Rifles—Cultivators—Books—etc., etc., etc.; all these are among the valuable articles to be found in the Premium List for 1874 on page 119. Any person can, with a little effort, secure one or more of these valuable articles. Thousands have done it. There is room for thousands more. It is very easy to obtain clubs of subscribers for the two popular papers, the *American Agriculturist* and *HEARTH AND HOME*. Try it.

A Botanical Directory.—The Torrey Botanical Club have issued a Directory giving the names and residences of all the persons known to them as being engaged in botanical pursuits in North America and the West Indies. The names are first placed in alphabetical order, and in the second part they are arranged according to states. The directory forms a part of the monthly bulletin of the club, which is sent to subscribers at \$1 a year. The price of the directory alone is 30 cents, and may be had by addressing the editor, W. H. Leggett, 224 East 10th street, New York.

The Banking House of Fisk & Hatch was forced to suspend during the panic, but having adjusted their affairs and being able to meet all their liabilities they resumed in December last. No firm in New York enjoys to a greater degree the confidence and esteem of business circles than Fisk & Hatch; and as their temporary suspension produced a feeling of profound regret, so the announcement of their resumption has been hailed with the most sincere pleasure by a host of friends. It is safe to say that they resume business with a stronger hold than ever upon the confidence of those with whom they have had business relations. This confidence was most substantially exhibited in the fact that during the first twenty-four hours after their resumption not a dollar of deposits was withdrawn, while a large amount of new deposits was received. The firm is now paying the semi-annual coupons on \$31,620,000 bonds of the Central Pacific, Western Pacific, and California and Oregon Railroads.

Hussey's National Cottage Architecture, or Homes for Every One. Chiefly Low-priced Buildings for Towns, Suburbs, and Country. By E. A. Hussey, architect. New York: Geo. E. Woodward, Orange Judd Company.—It sometimes happens that a work is offered which seems to exactly fill a gap in the class of literature to which it belongs. This is the case with the work the full and descriptive title of which is given above. It contains numerous designs of cottages and small houses ranging in cost from \$1,800 to \$3,000 and \$4,000, with a few still more costly ones. The designs are of an exceedingly neat and tasteful character, the division of the interiors well considered, and the ornamentation, while effective, not elaborate. Elevations, perspective views, and details are given with each design. Specifications to some of the plans are given which serve as a guide for drawing up such forms for others. The execution of the work is excellent, and is a handsome specimen of book-making. We have not in a long time seen a work which seemed to so exactly meet a general want, or one we could so heartily commend to those who propose to build. Price \$6.00.

A New Thrashing Machine in which the cylinder and concave is without spikes, is made by Wheeler & Melick Company, Albany, N. Y. In this machine the straw is not broken, but is carried from it sideways in a proper condition for tying up in bundles for sale, the same as hand-thrashed straw. The passage of the straw is more rapid than in the ordinary machine, and 250 to 450 sheaves may be thrashed per hour with a two-horse tread power.

Improved Hay Press.—P. K. Dederick & Co., Albany, N. Y., have an improved hay press in which bales of any size, from 100 lbs. upwards, may be made. The hay may be pressed, either long or cut into short fodder, and by an additional contrivance the hay may be weighed so that every bale is of the same weight. The cut hay is baled in a "perpetual press," and to prevent waste in using, the bales may be made as small as 25 pounds if desired.

See Page 119 and Third Cover Page.

Bugs in Peas.—"W. M. S.," Vancouver, Wash. Terr.—Tell your neighbor that when bugs once get established in a locality it is difficult to get rid of them. One of the best methods is to plant the peas intended to be saved for seed as late in the season as they will ripen. In your moist climate this ought to be practicable; and if all the growers in a neighborhood will adopt this the bug will die out.

The Early Beatrice Peach.—The *Agriculturist* was, we believe, the first journal to call attention to this variety. Some three years ago we noticed the receipt of specimens of the fruit from North Carolina and have kept watch of its progress since. Our trees were injured by the severe cold of last winter, but it has been fruited in a number of localities since. Colonel Edward Wilkins, of Kent county, Md., who is probably the largest peach grower in the world, has planted largely of the Early Beatrice. Hale's Early, heretofore our earliest variety, in most localities rots badly, while this is from ten to twenty days earlier, ships well and, as far as heard from, is free from rot. It is worthy of the attention of peach growers, and if it fulfils its present promise will add another leaf to the pomological laurel that crowns the venerable head of Thomas Rivers, its originator.

Gold Fish.—"A Female Subscriber" writes that the gold-fish in her aquarium will die, but as she tells us nothing about the aquarium we are unable to do other than guess. We guess that the fish die because the aquarium is in too warm a place or because they are not fed. The remedy for the first will suggest itself; for the other, roll soft bread into small pellets the size of duck shot and offer every few days. Remove such as are not eaten.

A Guinea Mower.—English horticultural papers announce a new lawn-mower which is claimed to be effective in all respects and is sold for a guinea. This is what our makers will ultimately come to. Who will step in first and make a fortune by offering a five-dollar mower? At this price great numbers of people whose grass plots are too small to warrant their using the present machines at \$15 to \$25 and upward, would purchase a small and effective one if sold at \$5. Of course, such a machine as this will not answer for those who have a large surface of grass; these will continue to buy the large machines. The \$5 machine would find its sale among those who have none at all.

Malt Dust.—"J. W.," Hollidaysburg, Pa.—Malt dust would be a useful fertilizer for berries, etc. We can not say what the value of it is, as it is not much used in this country. In England fifty to sixty bushels to the acre is considered a good dressing and equal to an ordinary manuring with other fertilizers.

Mucilage, etc.—"Yosemite."—Assuming you refer to mucilage of gum arabic, it may be kept from "becoming stiff" by keeping it covered; if too thick add water. We have not found it necessary to use anything to prevent souring. Make in small quantities at a time. We know nothing of the firm inquired about. Letters upon household and all other matters come to the editor, who distributes them to his associates according to their contents.

Dollars and Greenbacks.—"A. D. F.," Iowa.—The questions you propose are of a kind upon which widely differing opinions are entertained, and we could not give space to the discussion that an opinion either way would open. A sufficient answer to your first question is the fact that gold is the standard of value in all civilized countries.

Pear Trees.—"J. G.," Illinois.—The north side of a hill is preferable to the south; many prefer a north-east exposure to any other. The Bartlett is the pear found better adapted to a great variety of situations than any other and it is more profitable. Probably nine trees of this are planted to one of any other sort. For other varieties you should take the experience of those who have grown pears in your neighborhood.

Tuberous Chervil.—If any of our readers cultivate this we would like to have their experience. The seeds are offered by some of our seedsmen, but we never succeeded in making any grow, and we learn from a French journal that unless sown soon after ripening it rarely germinates.

Hedge.—"R. I. T.," Bricksburg, N. J.—The honey locust would make the best hedge for your locality.

Willows.—"J. W. H."—Cuttings from the size of the little finger to two inches in diameter and

from a foot to three feet long may be set a foot apart, making holes with a dibble or crowbar. But it is of no use to set them unless you can keep the ground around them clean and cultivated until well established.

Norway Spruce.—"B. L. H.," Mich.—For a screen with trees in a single row, six feet apart is the proper distance. When vegetation is scarce, especially if snow is on the ground, sheep will eat almost any green thing, and we should not be surprised if they nibbled the spruce.

Rational Horse Shoeing.—"E. H.," Benton, Wis.—This work is sent from this office by mail for \$1.

Double Geraniums.—Miss "C. F. G.," Accomac Co., Va.—These need no treatment different from the single. In pots a better bloom may be had by moderate use of liquid manure.

Camellias.—Mrs. "J. T. B.,"—Camellias drop their buds because the air is too dry. When growing they need a warm place, at other times a room where they will not freeze will answer. Can't advise about pruning without seeing the plants. No plants should be watered every day or every other day, whether they need it or not. Give water according to the kind of plant and its condition. Better allow the soil to get too dry now and then than to keep the roots constantly soaked.

The Blue-Grass Region of Kentucky.—"J. H. A.," Coleta, Ill. The blue-grass region of Kentucky comprises all that part of the State where there is a limestone soil; where the sandstone predominates this grass, although it will grow, does not flourish as upon the limestone. The so-called blue-grass region lies across the middle of the State, and covers about twenty counties, including an area of 12,000 to 15,000 square miles.

Saving Manure.—"H. D. B.," Ulster Co., N. Y. You will find descriptions of sheds for making and saving manure in articles in the *Agriculturist* of last month, as well as the present month.

Cranberries.—"M. E. D.," Vineland, N. J.—The fruit is borne upon the growth of the preceding year. Your other questions have been answered in other articles.

Becoming a Farmer.—"R. E. M.," Pittsburg. A careful, cautious man apt to learn, especially one who has been brought up to a mechanical trade, and therefore taught to use both his brains and hands, might soon learn to become a successful farmer. The first year he might expect to learn enough to enable him to pull through the second year with credit and more or less satisfaction. He should, however, closely watch his intelligent neighbors and consult with them, and not be ashamed to ask questions when necessary.

Web-Footed Hens.—"Old Subscriber," Fall River, Mass. The American Coot belongs to a family very distinct from that to which the hen belongs. Besides, it is not web-footed, but has its toes only margined with a membrane. If there is a race of web-footed hens in your locality we should be glad of a description of them, or a specimen, as you suggest.

Animal Dust.—"J. D. S.," Livingston Co., N. Y. Animal dust is the dried refuse of slaughtered animals, blood, bones, and offal, dried and reduced to powder. It is one of the most valuable fertilizers, and is now manufactured entirely pure and free from adulteration.

Foaming of Cream.—"Yosemite." When cream stands too long before churning in the winter time it foams up and "swells" in the churn, requiring longer churning, and sometimes refuses to come into butter at all. Too low a temperature in the milk-room also produces the same effect. The butter produced under such circumstances is inferior both in color and texture. The only preventive is to maintain a temperature of at least 55 degrees in the milk-room, and not to keep the cream more than four days before churning.

Fresh or Decomposed Manure.—"Peachblow." Since the year 1853 there has occurred a great change in the methods of culture of potatoes. Since that time the potato-rot has been very prevalent in places where it was previously unknown. It has been found that fermenting manure greatly promoted disease and assisted the growth of the destructive fungus; consequently its use has been abandoned, and thoroughly

rotted manure used instead. In England, where the moist climate is favorable to the potato disease, it has been found that superphosphate used alone tended to prevent its appearance, while with well-rotted manure the disease partially appeared, and with fresh manure the crop was totally destroyed. The author you refer to, who wrote twenty years ago, would probably greatly modify his views now in the light of our present information.

What came of a Windmill?—"J. T. Smith," Cedar Rapids, Iowa, gives his experience with windmills. He made a windmill of the pattern figured in the *Agriculturist* of May, 1872, with which he ran a small corn mill which ground one bushel per hour, by the addition of a 30-inch pulley upon the shaft of the windmill and a six-inch pulley upon the corn mill, and a 3/4-inch rope. He concluded that he had the cheapest power possible at the cost of only a few dollars until a sudden storm tore his mill to pieces. After some experiments he finally applied narrow strips, 4 feet long, to the arms, giving one square foot of surface to each strip. There are 106 of these strips upon a wheel, 12 1/2 feet in diameter, with which he is able to run a double corn sheller. When not in use the wheel is turned edge-wise to the wind. The mill, which is as simple as a common spinning wheel, cost \$12 for material and labor.

Manure for Cucumbers.—"B. S. H.," There is no special manure that is equal to barn-yard manure for any crop. But if barn-yard manure can not be procured, the next best fertilizer is a mixture of guano or hen manure, wood-ashes, plaster, and fine bone-dust in about equal proportions. They should be mixed quite dry, and used as soon after mixing as possible.

Permanent Whitewash.—With the return of spring comes the usual inquiries for a good whitewash. We have only to repeat the following directions given before, as follows: Take half a bushel of unslaked lime, slake it with boiling water, covering it during the process to keep in the steam; strain the liquid through a fine sieve or strainer, and add to it a peck of salt previously well dissolved in water; three pounds ground rice boiled to a thin paste, and stirred in boiling hot; half a pound Spanish whiting, and a pound of clean glue which has been previously dissolved by soaking it first, and then hanging over a slow fire in a small kettle inside a large one filled with water; add five gallons of hot water to the mixture, stir it well, and let it stand a few days covered from the dirt. It should be put on quite hot; for this purpose it can be kept in a kettle on a furnace. A pint of this mixture will cover a yard square of the outside of a house, if applied with a large paint-brush.

Feed Barrow.—In reply to many inquiries we would say that the feed barrow figured in the *Agriculturist* of January, 1874, is one that was made by one of the editors of this paper for his own use. The barrel was an iron-bound wine cask of 18 gallons and the arms were of hickory, steamed and bent into shape. The whole cost of the wheelwright's work was \$4, the rest of the work was done at home and really cost nothing but a few cents for bolts. A farm workshop ought to contain every necessary for making such an article.

Crops for Sowing to Grass.—"W. B.," Templeton, Mass. Neither Hungarian grass nor millet is a good crop to sow grass or clover seeds with. One serious objection against them is that they come too late, while these seeds should be sown early. If the soil is well prepared and in good order no foster crop is needed and the grass seed may be sown alone. We have raised an excellent stand of grass in this way, especially one of orchard grass, which, sown in April, might have been cut in July for hay. For clover it is preferable to sow it in this way, and, if the ground is rich and well prepared, it may be cut the first season.

"Hooks or Haws."—"E.," Madison, Ohio. When the eye is destroyed and the hooks are affected with a fungoid growth, the best remedy is a solution of nitrate of silver applied to the diseased parts with a camel's-hair pencil. It is quite possible that the removal of the diseased membrane by means of a sharp and pointed pair of scissors would be the simplest and best method; now that the eye is gone there is no use for the hooks.

The Cornell University.—The Register of this institution for 1873-74 is received—an exceedingly neat volume, which does credit to the University press from which it is issued. As an academic and technological college this seems to be meeting with a fair share of success. It has 461 students, and its faculty,

including residents and non-residents and instructors, numbers nearly fifty, and includes some gentlemen especially eminent in their specialties. We find the professorship of agriculture vacant, which perhaps it might as well be, as to be filled by a fresh importation from a country so unlike ours as England. And moreover, in the whole 461 students there are only seven recorded as in the course of agriculture. It is quite fair to say that the sinking of the Congressional agricultural college grant in this university was a great mistake. So far as agriculture is concerned the income of nine hundred and ninety thousand acres of land edneates just seven students. It takes the income of 141,423 acres of the land granted to the State of New York, which, at the government price of \$1.25 an acre—and we are informed that much of the land is worth much more—should at six per cent yield over \$10,000. It may be said that here are the opportunities, and it is the fault of those who wish to study agriculture if they do not avail themselves of them. We are not of those who charge the management and especially Mr. Cornell with improper discharge of their trust. We have seen nothing in the recent reports of the investigation of the affairs of the university to show that thus late in life Mr. Cornell has changed his character for benevolence and honorable dealing. The whole matter is simply a mistake on the part of both the New York Legislature and Mr. Cornell—a huge blunder which both parties should set about repairing as soon as possible. Had either of them known the simple horticultural fact that many plants, in themselves of the most robust nature, will not live under the shade and drip of other plants, they would have never made the mistake of exposing an agricultural school to the adverse influences of an academic one. No matter if there be no outward assumption of authority on the part of those in the academic courses, farmers' boys do not like to be even in contact with those who are pursuing branches to which they can never hope to aspire, and they will not go where they will be looked upon as in a lower grade of scholarship. The huge mistake of trying to do too much at Cornell with the national grant, has resulted, so far as agriculture is concerned, in doing so little that it may be called nothing. Unless some plan can be devised for making the grant more useful to agriculture where it now is, it were better that the contract be annulled and the fund placed where the rising generation of farmers may receive some benefit from it.

We are glad to observe that in the present Register the pedantic "trimester" is abandoned and the generally accepted word term is used to designate the division of the year.

Our Responsibility for Advertisements.

An individual in Michigan bought some corn that was advertised in the *Agriculturist*, and because the corn did not turn out as he expected, he thinks he has a claim upon us for damages, and threatens if we do not pay them that he will advertise us. As we believe in advertising, we shall not make it "write" with our Michigan friend, but hope he will proceed to carry his threat into execution, even to the extent of not taking the paper "enny more." We wish to say a word to this irate gentleman from Michigan as well as to other readers. We do not allow persons of known disreputable character, or even of doubtful reputation, to advertise. All the seedsmen who advertise are such as we believe will send exactly what they offer. Our directions to the advertising department are to receive no advertisement whatever of a doubtful or suspicious character. The corn complained of was the Sanford corn, advertised from Jamesport, Long Island. The purchaser does not complain that he did not get Sanford corn, but that it did not ripen as soon or yield as much as he expected. We know of no process by which we can supply people with brains. If this Michigan gentleman had seen an advertisement of a particularly productive pineapple or banana, he would probably have ordered it, and then complained that it did not give him any fruit. Now, any one who has sense enough to grow corn at all, knows, or ought to know, that there is no plant more affected by the conditions of climate and soil. In Canada they have a variety of corn that will perfect itself even as far north as Hudson's Bay; yet if a Canada planter were to get his seed-corn from Virginia, and make a failure, it would not be due to the poor quality of corn, but to his own ignorance. Our Michigan friend, who lives 50 miles north-west of a part of Michigan in which we have seen frost every month in the year, and the corn-fields blackened on the 5th day of July, gets a corn from Long Island, where they have the mildest winters and the longest growing seasons of any part of New York state, and expects it to be snited to his climate. He may, after several such blunders, learn that there are certain varieties of corn snited to his climate and others that are not. Then again, after all that has been said about novelties in the

Agriculturist, we have not the least sympathy for a man who relies for his main crop upon a new and untried thing; for we have given so many warnings against it that whoever does so can not blame us. One who has a new variety advertises it at a high price. It is well that new varieties should be introduced, and it is well that those who offer them should get a good price; for once out of their hands they lose all control over them.

A sensible man in seeing a new thing, corn, for instance, advertised, will order enough to test and, if it is found valuable, furnish him with a supply of seed for another year. He invests a sum the loss of which he will not feel should his new corn prove a total failure, for like a wise man he has depended upon a well tried kind for his main crop. Now we have no doubt that with the advertiser on Long Island, the Sanford corn "in many instances has ripened in 85 days from planting," any more than we doubt that in some other localities it is as useless a variety as can be planted. Would this Michigan man have ns put under the advertisement of Sanford Corn—"N. B. People who live in Central Michigan must not try this corn?" We assume that our readers have common-sense and some knowledge of geography and climate, and that a man, if he is a corn-grower in Michigan, will not be foolish enough to depend upon seed from Florida or any other place where the climate is different from his own. So with other seeds of novelties. We have a tolerably wide acquaintance with seedsmen, and we know that as a class they are exceedingly careful and conscientious. They know too well the money value of a good business reputation to risk it by offering anything that they know or suspect to be a humbug. They must offer novelties, for the public expect and demand them, and they must in all new things depend upon the statements of others, but they do not warrant onion seed to produce onions in Georgia, or cotton-seed to give a paying crop in Minnesota. They send out their catalogues supposing people of intelligence enough to read them have some knowledge of the capabilities of the country in which they live. Michigan man will please take notice that while his concluding threat has no terrors for us we give it for the benefit of the school authorities of his state: "if you don't do enything about this I don't think I shall take it enymore, and I will advertise it to." Advertise us by all means.

The Patrons of Husbandry

The annual meeting of the National Grange is in session at the time we go to press. Such portions of its proceedings as are allowed to be made public have been given in the daily papers all over the country. This meeting has been looked forward to, not only by the patrons themselves, but by all who have from one interest or another watched the movement, as one which will have an important bearing upon the future of the order. Those who wished it well hoped that this meeting would so act as to give the order strength and permanence, while those who had a political interest in the matter looked for some action that should make it useful as a political machine. The opening address of Grand-Master Adams as well as the action of the Grange thus far can have given very little hope to the politicians, while all that has been made public of their transactions has been marked by a moderation and thoughtfulness that must commend it to all, whether friends or opponents. There never was a stronger illustration of building "better than he knew" than is presented by the Patrons of Husbandry. For years of an insignificance almost ridiculous it began to grow, and when the general agricultural mind was in that state that it needed a nucleus around which it could crystallize, in order to give force and embodiment to its thought, the organization was ready at its hand with sufficient machinery to bring farmers together and give expression to their wishes. There are now over 6,000 granges with a membership of over a million. That unforeseen difficulties should arise from a growth so unlooked for, and that an organization which anticipated a limited membership, should be embarrassed by new questions, is not to be wondered at, nor is it strange that now and then a grange should withdraw from the organization. We may trust that difficulties, as they arise, will be met with the discreet decision that has thus far marked the action of the National Grange. The "declaration of purposes" by the National Grange comes just as we are closing these pages. It is a document that we should gladly publish in full were not our columns already closed. So well considered, so clear, and altogether so admirable a document, in sentiment and purpose, does not often emanate from any organization. While we commend it as a whole to all who wish to know about the Patrons of Husbandry as the latest exponent of their principles, we can not refrain from publishing an extract which is a part of the second article:—

"We heartily indorse the motto: 'In essentials,

unity; in non-essentials, liberty; in all things, charity.' We shall endeavor to advance our cause by laboring to accomplish the following objects:

"To develop a better and higher manhood and womanhood among ourselves. To enhance the comforts and attractions of our homes, and strengthen our attachments to our pursuits. To foster mutual understanding and cooperation. To maintain inviolate our laws, and to emulate each other in labor. To reduce our expenses, both individual and corporate. To buy less and produce more, in order to make our farms self-sustaining. To diversify our crops, and crop no more than we can cultivate. To systematize our work, and calculate intelligently on probabilities. To discountenance the credit system, the mortgage system, the fashion system, and every other system tending to prodigality and bankruptcy."

Catalogues Received.

So many catalogues are at hand that our notice of each must necessarily be brief. They are named in the order of receipt. We must request our friends not to write asking which nurseryman or seedsman they should purchase of. We do not notice the catalogues of or admit the advertisements of any who we have reason to believe will do other than fairly by their customers. Our advice always is to purchase—other things being equal—of the dealer nearest home, for the reasons that it is advisable to encourage local trade, and especially in the case of trees, one is likely to receive the articles in better order. The present mail facilities allow one to procure seeds and small plants from any dealer he prefers. We would add the often repeated advice to order early, whether seeds, plants, or trees.

SEED CATALOGUES.

WASHBURN & Co., Boston, Mass.—A large descriptive volume of about 130 pages, including several specialties, and embellished with a handsome colored plate of a bouquet of flowers.

ALFRED BRIDGMAN, 876 Broadway, N. Y., sends two compact catalogues, one for vegetables and the other for flowers. This old establishment is quite up to the newer ones in presenting the novelties of the season.

VANDERBILT BROTHERS, 23 Fulton street, N. Y., offer the standard vegetable and flower seeds, fertilizers and agricultural implements. Many of these last are illustrated.

G. A. LAW (Dudley Seed-farm), Roslindale, near Boston, Mass., has an "advance catalogue of flower and vegetable seeds of his own raising and importation."

PETER HENDERSON & Co., 35 Cortlandt street, N. Y., send a very full and exceedingly neat illustrated catalogue, which, besides the usual varieties, has numerous novelties in both vegetables and flowers. This is accompanied by a fine colored plate of a group of pinks.

WOOD & HALL, Geneva, N. Y., offer a handsome list of seeds and garden requisites, prefaced by useful instructions and offers of premiums to purchasers.

J. M. THORBURN & Co., 15 John street, N. Y.—This old and well-known establishment does not send out such showy catalogues as some others, but their exceedingly neat and compact vegetable and flower lists, which are published separately, show that they are as wide awake for novelties as their competitors.

CHASE BROS. & WOODWARD.—This comparatively new firm adds another to the list of Rochester, N. Y., seedsmen. Their catalogue is not behind the rest in showing a well considered selection of flower and vegetable seeds, many of which are raised on their own grounds.

R. D. HAWLEY, Hartford, Ct., has a neat illustrated catalogue of garden seeds and agricultural implements.

NICHOLAS COLE, Pella, Iowa, grows all the seeds that can be raised in his locality, and claims that Iowa-grown seeds are of superior quality. His list includes the standard varieties of vegetables and flowers and the novelties.

CROSMAN F OS., Rochester, N. Y.—The Crosmans, father and sons, have long been known as reliable seed growers. Their catalogue gives home-grown and imported varieties, with some specialties of their own.

KERN, STEBER & Co., St. Louis, Mo.—St. Louis shows her metropolitan character in various ways. In this seed catalogue we have a list quite as large as that sent out by any New York establishment. It is surprisingly full in every department, and contains several varieties that have a peculiar Western reputation.

BRIGGS & BROTHER, Rochester, N. Y., like some other dealers, publish their catalogue as a quarterly. They have adopted the title, "Illustrated Floral Work," and the number for January contains their full seed catalogue. In elegance of illustration and style in paper and print, this is a wonder in the way of catalogues. It is

filled to repletion with old and new things in flowers and vegetables.

D. H. BROWN & SONS, New Brunswick, N. J., send a catalogue of the leading vegetable seeds, and follow the English plan of offering premiums for the best exhibition at their store of varieties raised from their seeds.

R. H. ALLEN & Co.'s catalogue of garden, flower, and field seeds and grains is a characteristically neat production. Besides the standard varieties and current novelties, the portion devoted to garden implements is very full and well illustrated.

D. T. CURTIS & Co. (successors to Curtis & Cobb), 161 Tremont st., Boston, Mass., send three catalogues, one each devoted to flower and vegetable seeds, and the third contains the novelties of the year in both departments. Besides the matter of a catalogue, they give a list of the leading agricultural and horticultural journals and books.

YOUNG & ELLIOTT.—This old-established firm, at No. 9 John street, send out a catalogue containing all the usual varieties of vegetables and flowers, with several special novelties of their own.

SUTTON & SONS, Reading, Eng., send us their "Spring Catalogue and Amateur's Guide," a large and very elegant volume, and the only foreign one we have seen that approaches the catalogues of some of our seedsmen. The wood-cuts are generally of great excellence, but the colored plates do not equal those of Peter Henderson & Co., Vick, Bliss & Sons, Briggs Bros., and others in this country. It is a very full and interesting document, as becomes a catalogue of such a widely known house.

NURSERY CATALOGUES.

ARTHUR BRYANT, JR., Princeton, Ill., sends a catalogue of the best varieties of fruits, and pays especial attention to evergreen and deciduous ornamental and forest trees.

DUTCHESS NURSERIES, Poughkeepsie, N. Y., are now conducted by W. L. Ferris, Jr., & Co., who succeed L. M. Ferris & Son, and propose to keep up the reputation of the establishment for furnishing "their customers with such stock that they will merit further orders."

BLOOMINGTON (Ill.) NURSERY.—Our friend, F. K. Phoenix, has outgrown Bloomington, and has run over into Normal with his extensive nurseries. He offers about everything that any one has in the way of nursery stock in his own original style.

PINE GROVE NURSERY, Wm. Horton & Son, Allen's Corner, Cumberland Co., Me., offer fruit and ornamental trees, especially adapted to the colder parts of the country. They emphasize the sensible advice to plant young trees, and offer young evergreens from the forest at ridiculously low prices, and give proper directions for planting them.

S. B. PARSONS & SONS, Flushing, L. I., N. Y., devote themselves especially to ornamental evergreen and deciduous trees and shrubs. They make a specialty of rhododendrons, camellias, azaleas, and some other plants of slow growth, as well as of tender and hardy roses. That the plants sent out by Mr. J. R. Trumpy, the celebrated propagator of the establishment, are of most excellent quality, we can testify from personal knowledge.

FRUITLAND NURSERIES.—P. J. Berckmans, Augusta, Ga., has in his catalogue all the fruit and ornamental trees and shrubs that succeed in the warmer states. It of course includes many kinds the names of which are unfamiliar to the northern cultivator, but which experience has shown to be most valuable to the Southern planter. We never saw finer stock than that in these nurseries.

T. S. HUBBARD, Fredonia, N. Y., send a wholesale list, in which the leading varieties of grape vines and fruit trees are offered to planters and dealers at low rates.

GEORGETOWN (Del.) NURSERIES.—R. S. Johnston offers the usual assortment. Peach trees a specialty, and at very low rates.

STORRS, HARRISON & Co., Painesville, O., make a specialty of the American chestnut trees and seed; they offer, besides, other forest trees in large quantities.

MOUNT HOPE NURSERIES.—Ellwanger & Barry, Rochester, N. Y., have one of the largest nurseries in the world. Their various catalogues, including hardy and greenhouse stock of all kinds, when bound together, form an attractive volume, which comprises about everything that is worth growing in the lines of fruits, ornamental trees, or greenhouse and bedding plants.

RANDOLPH PETERS, Wilmington, Del., is the proprietor of the "Great Northern and Southern Garden and Nursery." While he gives special attention to the peach and pear, he offers a general assortment. In a visit to this nursery two years ago, we found the peach stock remarkably thrifty and handsome, and the pear orchard probably not to be excelled this side of California for productiveness and fine fruit.

F. J. KINNEY, Tatnuck, Worcester, Mass., sends a so-

lect list of small fruits, including grapes. The catalogue is judiciously small, but contains all the really valuable and well tested sorts.

GREENHOUSE AND BEDDING PLANTS.

F. K. PHOENIX, Bloomington, Ill., does not confine himself to the nursery, but is largely in the plant business. His new catalogue of this department contains several novelties that we have not seen elsewhere.

STORRS, HARRISON & Co. send out a neat illustrated catalogue, in which they offer new and old greenhouse and bedding plants and roses in great variety.

PETER HENDERSON, 35 Cortlandt street, N. Y., sends the twenty-sixth annual catalogue of his extensive greenhouses at Jersey City Heights, N. J. The novelties as well as the standard varieties are illustrated by numerous wood engravings, and the catalogue embellished by two large, fine colored plates—one of Verbenas and the other of Fuchsias.

BELLEVUE NURSERY Co., Paterson, N. J., H. E. Chitty, Supt., send a combined plant and seed catalogue. Though a comparatively new establishment, this shows commendable enterprise in offering new plants as early as the earliest; and we have had frequent occasion during the past year to speak of the fine and rare plants sent out by them.

LIVE STOCK.

CLAUDE MATTHEWS, Clinton, Indiana, issues a catalogue of the "Hazel Bluff" herd of Shorthorn cattle, which is handsomely illustrated with portraits of choice animals.

F. J. KINNEY, Worcester, Mass.—Brown Leghorn fowls.

IMPLEMENTS.

THE BUCKEYE MOWER AND REAPER.—Accompanying their price-circular, Messrs. Adriance, Platt & Co., send out some illustrations of their machines on the road and in action which are remarkably fine and spirited.

THE HIGGANUM MFG Co., Higganum, Ct., publish a catalogue of their plows and other farm implements in the form of "The New Almanac," in which useful information and advertising are judiciously combined. The publishers have had the good sense to take a portion of their "agricultural clippings" from the *American Agriculturist*, and what is more, to acknowledge their indebtedness.

Patents.

We presume that there are but very few of our readers who are not interested one way or another in patents. In fact, there is hardly an article of every-day use, whether it be an expensive personal ornament or the homeliest household implement, but bears the magic adjective "patented." As there are very few persons who understand our patent system, we state in brief its fundamental principles.

The public say to the inventor—You have a valuable secret which may benefit us. To disclose it without protection would be to lose it. To keep it would deprive us of its use. If you will disclose it to us by so describing and illustrating that we may fully understand it, and may avail ourselves of it without difficulty, we will agree that for seventeen years you shall be protected in its use; you may make out of it what you can. When your limit of time has expired we shall have it without further payment. We can not pay you in money, we will pay you in time. This is a fair bargain. A new thought developed, explained, described, illustrated, put on record for the use of the nation—on the one side. The right to the exclusive benefit of this new thought for a limited time and protection in that right—on the other. This is the patent system; a fair contract between the public and the inventor under this system. The inventor's best and only security is to take out a patent that shall fully and carefully describe and show his invention in proper form, and of sufficient scope to protect him in the exclusive use of his invention during the seventeen years that the patent is granted. It is safe to say that a very large proportion of all the patents granted are for inventions of real value, and that the inventors would reap handsome rewards for them, if they displayed as much business tact as they do inventive genius. Here is the reason so many patented inventions fail to bring the reward hoped for by the inventor. The invention is valuable enough, and the public will appreciate it if you put it before them in the right way, but it is this *putting before the public*, in other words, the management of the business growing out of the invention, that causes the disappointment in so many instances. If the inventor locks his patent up in his bureau-drawer, and expects it will make him wealthy without further effort, he does not have to live very long before he discovers his mistake. We therefore advise our friends who patent valuable inventions to conduct the business

growing out of their patent in a judicious manner, and they will be rewarded. In response to the frequent inquiries of our friends we have established, in connection with the *Agriculturist*, a Patent Department through which inventors may patent their inventions, and have all their business concerning patents promptly, faithfully, and ably attended to, with the additional assurance that their business will be conducted honestly and at reasonable rates. A pamphlet giving full particulars may be had on application.

Hardened Sweet-Potato Plants.

BY J. B. ROOT, ROCKFORD, ILL.

Since the cultivation of sweet-potatoes has been found to be so easy, and has become so general even in the northernmost States, the demand for "slips" or plants has been so large as to make their growth an important business. But during the past few years a strong and a well-founded prejudice has arisen against Northern-grown potatoes, because when cooked they are more watery and less sweet than those from the South, and moreover do not yield nearly as largely.

This, it is generally believed, is because our seasons are not warm enough to fully mature the roots. This is certainly a mistake, for during our warm weather the temperature is quite as high as that of the South, but it is not so long continued, and it therefore behooves us to put our plants in that condition that they can derive benefit from all the heat we do have, and shall be in excellent working order from the first day of sufficient temperature for them. For several seasons I have sought this condition by bedding my potatoes at least three weeks before the usual time in this latitude, say by the 20th of March, and then bringing them forward as rapidly as possible until ready to pull. They are then transplanted or "heeled in" about three or less to the inch in rows four inches or more apart in a mild bed. Here they quickly begin the process usually undergone in the open ground a month later—throw out their secondary or true roots and become independent plants, drawing sustenance from the soil instead of the mother potato. It is while undergoing this radical change that so many die, and the others are so put back as to not make any perceptible growth for two or three weeks. This change is much more quickly made in the certain and even temperature of the hot-bed than in the open air with its sudden changes and often its long cold rains. Moreover, aside from the quickness and safety with which the plant strikes true roots, it is already three weeks ahead of the general crop.

In this second bed, if the vines grow too rampant before the open ground is ready for them, shear off the runners and draw a knife between the rows to root prune, as recommended for tomatoes. This induces the growth of a new mass of roots, and doubly insures the life and thrift of the plant when put in the field. After they are well rooted in the second bed, give them all the exposure they will stand without injury, and harden them so they can be set in the open field as soon as danger of frost is past. But few are lost when transplanted into ridges, and they quickly cover the ground with vines, and not only yield more and larger potatoes, but vastly better ones. I think I have eaten as sweet and dry potatoes of my own growing as any we receive from the South.

This method, of course, entails considerable labor, and in growing the plants for sale the experiment should not be entered upon largely the first season, for buyers rarely feel willing to pay the increased price for any quantity of the plants until they have given them a year's trial. But in raising plants for home use you certainly will not regret treating a good many in this way.

Forest Trees from Seed.

Tree planting has become in some parts of the country a subject of great importance. Trees for timber, fuel, shade, and shelter are needed in all prairie countries, and while we appreciate the great necessity for tree planting, and would urge every one, East or West, to consider whether timber is not the best crop he can put upon parts of his land, we have not had so much to say about raising trees from seed as perhaps our friends think they have a right to expect. We would not lead our readers into experiments that if not expensive are likely to be fruitless. How many persons opening up a new farm on the prairie can find time to take proper care of a vegetable or a flower garden? Yet the raising of trees from seed demands as much or more care than do vegetables or flowers, and our hardy white pine and other evergreens require in their early years much greater attention than a delicate flower. Premising that we advise no one to undertake to grow trees from seed unless he is quite able to give them as much care as the same number of let-

tuces or cabbages, we give a few condensed notes which will answer many inquiries.

EVERGREENS we can not advise the ordinary farmer to undertake to raise from seed; they require so much care in shading and otherwise, and small plants are sold by those who make a business of growing them at such low rates, that we are sure that 99 in 100 will find it much more satisfactory in the end to purchase. We therefore confine our remarks to deciduous trees.

TREE SEEDS THAT MUST BE SOWN AS SOON AS RIPE.—Soft or Red and Silver Maple, Elm, and Red Birch. If kept exposed even for a few days after they are gathered their vitality will be destroyed. These seeds are not generally kept by seedsmen, though some take orders in advance to be filled when the seeds ripen. Those who wish to sow seeds of these should arrange beforehand with some friend to gather them, or dealer to supply them, and be prepared to sow the day they are received. The plants come up at once, and make nice young trees by fall.

TREE SEEDS TO BE SOWN IN PLACE—that is, the seed is to be sown where the tree is to stand—include the different Hickories, the Bntternut, and Black Walnut. The seeds are collected in fall, made into heaps, and covered with sods, over which are thrown several inches of earth. In the spring the nuts are sown in place, putting in two or three near together, and if all start remove all but one.

TREES THAT MUST BE TRANSPLANTED WHEN SMALL.—The Chestnut, Beech, and Oaks of all kinds are to be sown in a seed-bed and transplanted the first or second autumn. The nuts are to be kept during winter, mixed with at least an equal bulk of sand, in a cool place where they will not get too dry.

SEEDS OF TREES THAT MAY BE SOWN IN FALL.—Ash of various species, Liquidambar, Tulip-tree, Cucumber, and other Magnolias. These may also be sown in spring if properly kept through the winter in sand.

SEEDS BETTER SOWN IN SPRING, but they should be carefully kept through the winter in sand.—Maples of all kinds, including the Ash-leaf or Box Elder, and excepting the Silver and Soft; Birches, except the Red; Bass-wood; Kentucky Coffee-tree; Ailanthus; Catalpa; Paulownia.

SEEDS NEEDING PREPARATION before sowing in spring.—Osage Orange, scald and keep warm and moist until it sprouts; Button-ball, soak; Honey Locust and Common or Black Locust, scald.

TREES GROWN FROM CUTTINGS.—All Willows and Poplars from branches an inch and less in diameter; Ailanthus and Paulownia from cuttings of the root.

Seedling trees require just as careful thinning and weeding as a crop of carrots. If they suffer from the heat of the sun, stick brush with the leaves on all over the bed sufficiently thick to give a proper shade, or use a screen of lathes.

The leading tree seeds are kept by most seedsmen. Those who make a speciality of them, and keep a full assortment are: J. M. Thorburn & Co., New York; Thomas Meehan, Germantown, Pa.; and Arthur Bryant, Jr., Princeton, Ill.

Bees Notes.—Advice to Beginners.

BY M. QUINBY.

The location of the apiary should be attended to early this month. I do not mean by this that when bees are comfortably housed they shall be put out, unless warm weather makes it advisable. But choose the location now, and get things ready. If there is nothing to break off the wind, particularly from the north-west, put up a close, high board fence—if ten feet high all the better. Have the location warm. Allow the sun to strike the hives as nearly all day as possible until hot weather. If the soil is not very moist set them within two or four inches of the ground on blocks or bricks. If wet have them a little higher. Whatever the distance may be, have an alighting board reaching from the ground to the entrance, one edge resting on the ground, the other on the upper side of the bottom-board, so that if a bee alights anywhere within a foot of the entrance it can creep into the hive without again taking wing or losing time searching for it. Conceive something to enlarge or diminish the size of the entrance according to the number of bees at work during the spring months. Unless robbing bees are around, allow them to pass to and fro freely. Tin slides running in tin grooves are very convenient to graduate the entrance. During spring let all openings, however small, in the upper part of the hive be closed, to prevent the escape of the warm air. Bees the first time they leave the hive mark the locality, and if that is to be changed let it be done at once, unless they are to be moved a mile or more away, so that no time or

bees be lost by doing it later. If they are to be moved over a rough road a sleigh is best, a spring wagon next best. If moved by rail, the greatest danger is in setting the hives down harshly. To prevent breaking the combs, put staves of an old flour-barrel under the bottom for springs; screw these fast on the center of the bottom of hive, the ends bending downward, so that the weight of hive will rest upon them. Two or three are enough. Mark plainly: "This side up; handle with care." Express hands usually have a little interest of their own, inducing them to work with caution when handling a hive of bees.

If bees are comfortably housed, and remain quiet, do not be in a hurry to get them out before they can get something from flowers. Whenever they are disturbed in being set out, or in any other way, they are apt to fill themselves with honey. It has recently been ascertained that the liquid portion of this honey will pass off in the form of vapor, or insensible perspiration, if the bees are kept surrounded by a warm atmosphere. If too cool it creates a sort of dysentery, accompanied by a discharge which soils everything it touches. That the excrementitious portion of this food is discharged in a dry state in winter when the bees are healthy is proved by testing the substance that falls on the bottom-board under the bees. To do so, get some of it; half fill an ounce phial or other glass vessel and put in some clean water, and then put the vessel containing it in a dish of cool water; set it on the stove and bring to the boiling point. The little scales of wax which are mixed with it rise to the top. The excrementitious portion settles a little, and may be seen directly under the wax. Some of it may settle to the bottom soon, especially if entirely free from wax. Bees can and have been comfortably housed for six or seven months, and come out clean and healthy, and discharge as little in a liquid state as those that have been confined only a fortnight; a fact which is explained by the supposition that their excrement is passed in a dry state. The little liquid that a healthy bee does discharge when first set out is probably owing to the change of temperature it is subjected to at the time.

Another thing: It has been found that bees comfortably housed consume less food than those out doors. Bees that are outside fly out every moderate day. We have all seen something of the quantity of excrement discharged, particularly on snow. We can easily imagine that if all these drops of liquid had been properly digested and assimilated it would have lasted for months. Hence the necessity of housing or keeping warm for that reason if no other. We have a stock that has been in the open air all winter to the present time, January 31st, and it has consumed only one pound and a half in January. Another that was in the house consumed one pound and three fourths. One year ago at least three or four pounds would have been consumed, owing to the weather. Forty years ago Mr. Weeks, one of the first American writers on bees, stated in the Albany Cultivator that two or more swarms could be united and wintered in one hive and not consume any more honey than one single swarm would alone. This seemed so unreasonable that I could not avoid trying the experiment by uniting several. In some hives I put two and in some three stocks. I weighed them October 1st and April 1st. They were housed, and in box-hives. Several single ones consumed exactly what the trebled ones did; double ones did the same. Only one of the trebled ones exceeded any of the others, and that by only three pounds. Why many bees eat no more than a few I believe has never been explained. But if we take the temperature into account as affecting the digestion it will throw some light on the subject. We all know that a single bee is easily frozen, and is quicker chilled than a cluster of them, and a small cluster sooner than a large one. Three swarms together in a hive will create more heat than a single one. In a large swarm all the honey is consumed and assimilated because of sufficient warmth. In small numbers quantities of food are discharged and wasted because the bees are not warm enough. Keep the hive warm all the season.

Ogden Farm Papers.—No. 49.

We have not kept the record of our dairy business with the minuteness with which it would be done on an experimental or "model" farm, but such figures as we are able to adduce from the accounts of 1873 may have some value as an item in the statistics of butter-making, which are gradually developing in the agricultural press.

The following record of milk produced begins on January 5th (the first Sunday), 1873, and ends on January 3d (the first Saturday), 1874. The regular Jersey herd consisted of

the following animals, of the ages and conditions stated:

Table with columns: Name, Age, Condition. Lists various cows like Rene 2d, Romp, Flora, Renella, Margery, Omo, Xyrida, Fantita, Mirth, Nora, Goldstraw 2d, Flora Hinman, Rhoda, Calliope, Flora Ogden, Rene Ogden, Fantine, Pet Margery, Evangeline, Noreina, Oonan, Audrey, Enid, Elaine, Anna Roxbury, Thrift, Daisy, Luck Lass, Virgie, Belle Ogden with their respective ages and conditions.

In addition to these there were two Jersey cows in the herd for a few weeks who gave together 477 lbs. of milk.

Also, nine grades and natives, which were milked an average of 19½ weeks.

The Jerseys named above appear and disappear on the milking list, as shown in the following table. Some had been dry for some time, owing to accidental causes, and some came in with their first calves:

Table with columns: Name, Date of birth, Date of calving, Age at calving, Date of first calving, Remarks. Lists cows like Rene 2d, Romp, Flora, Renella, Margery, Omo, Xyrida, Fantita, Mirth, Nora, Goldstraw 2d, Flora Hinman, Rhoda, Calliope, Flora Ogden, Rene Ogden, Fantine, Pet Margery, Evangeline, Noreina, Oonan, Audrey, Elaine, Anna Roxbury, Thrift, Daisy, Luck Lass, Virgie, Belle Ogden with their respective dates and remarks.

* Aborted. Six of the milking animals were sent to our sale depot in Illinois, November 21st.

It will be seen from this list that of the 30 Jerseys 6 were 3-year old heifers with second calves, and 7 were 2-year olds with first calves. Nine abortions, falling largely among the better animals, seriously diminished the yield.

The product of milk for the year was 103,180 pounds. Of this the nine grades and natives gave 15,041 pounds and the odd two Jerseys 447 pounds, leaving 87,692 pounds for the Jerseys. Counting the whole thirty as cows,

and as being in the herd for the whole year, the product would be 2,923 pounds each. But it was far from being a herd of thirty cows. Of Renella, Margery, and Thrift, we had only the fag end of their unfavorable milking of the previous year. They were entirely absent eight, nine, and seven months, equal to an absence of 2 cows for 1 year. Those sent to Illinois being deducted equal an absence of 1 cow 1 year. The 7 two-year old heifers and the 9 aborting animals would be liberally treated if we were to count them as equal to half as many cows, or deduct 8 for them for the whole year.

These deductions will bring the herd of the year to nineteen average cows, yielding an average of 4,615 pounds, or—calling $2\frac{16}{100}$ pounds a quart—to an average of 2,146 quarts.

The foregoing is of course only an estimate, but it is an estimate based on a carefully kept record. Knowing the character of each animal, I think I have overstated none of the deductions, and that it is well within the limit of fairness to rate the herd of Jerseys for the year at nineteen cows. If our first object were to make a large product of milk and butter, the yield would have been considerably greater than it was, for there are a number of animals which would be discarded to make room for larger milkers. For instance, Flora has lost one quarter of her udder, and others have, for various reasons, fallen off in milking value. Our main purpose is to breed Jerseys for sale; Flora and the others spoken of are naturally excellent, and they bring calves of first rate quality. Therefore they are kept and are profitable. If a cow is a good breeder and brings valuable calves it pays us to retain her whether she is now a large milker or not. Then, too, we feed for breeding, not for milk, and for good milking condition, not for fat. Probably our product of butter could have been increased from one fourth to one third by the liberal use of corn-meal, but this would have given the cows, and probably their calves, a tendency to take on fat, which is exactly what is not wanted in a butter-making animal; would have increased the danger of milk-fever and the risk at calving time; and would, if continued, probably have sent the whole breed to the shambles earlier than the less stimulating food they get, which consists (in addition to their hay and green fodder) almost entirely of wheat bran. Some years we have roots, but this time the drouth prevented.

How much the severe and long-continued drouth affected the year's yield it would be idle to guess, and there is no use in a farmer imagining what would have been if—and if, and if. Every year is full of "ifs," and they may as well be disregarded first as last. The foregoing is an exact statement of what happened at Ogden Farm in 1873. I wish it had been ever so much better, and it should have been better, but I have set forth all the drawbacks we can fairly claim, and the account is presented without complaint. We have the satisfaction of knowing that it is better than the average.

While it is not our *first* object to make a large product of butter, this is a very important object, and we do make all we can. During the past year we have bought milk from near neighbors, and this year we propose to buy from others a little farther away. In time we may extend to all who care to sell to us, who are near enough for their milk to be brought without too much jolting. We pay

four cents per quart delivered at the milk house. What we have bought this year has made (by frequent experiment) just about one pound for each twelve quarts, averaging the different seasons. If we get 48 cents for the butter we have the skimmed milk for profit. In 1873 we bought 15,422 quarts, which, by the above calculation, made 1,285 pounds of butter. Much of this was sold for 50 cents per pound, not much for less, and some of it being worked in (in the churn) with our own cream for \$1.

The whole amount of butter made, including what was consumed on the farm, during the year was 5,912 pounds. Deducting for the purchased milk 1,285 pounds, leaves 4,627 pounds for our own herd. Of this, taking out for the 15,494 pounds of milk (of the nine natives and odd two Jerseys) equal to 7,206 quarts, yielding, at 12 quarts to the pound, 600 pounds of butter, 4,027 pounds is to be credited to the regular list given above. Dividing this by 19, we have a yearly average of 212 pounds per cow.

Aside from what was consumed on the farm we sold butter for cash to the amount of \$4,472.85 over all expenses. The purchased milk cost \$616.86, leaving as a net income \$3,855.99. The proportion of this due to the natives and odd cows is \$574.52, leaving \$3,282.47 for the regular herd. This divided by 19 gives an average income of \$172.76 per cow. In making up this account we have deducted \$269.02, 124 cents per pound on 2,153 pounds of butter sold in Boston—this being paid for freight and commission; including this, the sales amounted to \$4,741.87.

We have had no difficulty in keeping up the price to one dollar per pound with all our regular customers, of whom we have all we can supply with certainty, and could probably advance it without losing many of them. The irregular surplus has been sold mainly for 50 cents per pound, but if there were more of it it could be placed at a higher price. We have one advantage in being near a place of summer resort, giving us a market at full rates for all we can make at that season, thus avoiding the necessity of bringing most of our cows in in the autumn, as we should have to do if we depended on a city market.

Do you ask how such prices are to be got? I answer, by making a really good article (which comparatively few people in American cities ever see), by putting it in the consumers' hands in the most attractive form possible, and by teaching them to depend on it by always giving them a supply and never having any irregularity in the quality. Give them this and your butter will become a necessity to them, they will no more return to the ordinary "first quality" of firkin butter than you would yourself; they will go without butter first, and so would you. This involves the necessity of educating your public, but it is remarkable how readily and quickly they take the instruction. The palate, of course, has most to do with the matter, but the eye is an important organ to be considered. A friend writing from Boston, speaking of our butter as the best she has ever seen, says: "I don't know how your dairy woman looks, but I am sure she must be an artist in her way, to send forth such beautiful looking pats, so perfectly stamped and so neatly done up. It is the most inviting looking butter we ever saw. The color is perfect and so

is the consistency. It quite spoils us for what we were eating before, though at the time we thought that excellent." When people get into this frame of mind they can be depended on for permanent custom at high prices.

Of course many a farmer will lay our success (in the matter of price) to our situation, and so be inclined not to take a suggestion from the example. But every one who makes butter to sell makes it for a market, and in every market the best butter commands the best price. If *all* were first rate, high prices would be unknown, but the fact is that there is very little first rate butter to be bought anywhere, and there is a fair field open in every town in the country for an improvement. Of course it is only near wealthy communities that really extravagant prices can be obtained, but it should be borne in mind that the extra price is *all profit*, and if it is only 15 cents, or 10 cents, or even 5 cents, it adds so much to the *net* income of the dairy.

It would surely be safe to predict that the number of people in America who would gladly pay for their table butter fifty per cent more than the regular price of their markets, will increase quite as fast as they can be supplied with a *first rate* article. In Philadelphia the whole class of well-to-do people (not rich people only), pay for their butter much more than the highest market price of New York. Away from home they eat no butter, not being able to get anything to compare with that made in the counties near them and brought in fresh every week. The more fastidious of them are supplied by specially good makers, and pay from 90 cents to \$1.10 per pound. When they go to the sea-shore or to the mountains in summer they add the considerable cost of having it brought to them by express, packed in ice. This well-fed community has learned by experience what good butter is; they economize in other things if necessary, but they must have their accustomed good butter or none at all. In every city, town, and village in the land there are plenty of people who can be easily brought to the same way of thinking. It rests only with those who supply them to teach them the way to go.

It is reported that at a meeting of the American Dairymen's Association, a prominent member said: "Butter-making is a fixed science. Everybody knows all about it; it is of no use to bring it up here." I have no doubt that this opinion is widely shared by the farmers of the country, and especially by their wives. It is true they know how to skim a pan of milk, how to work the dasher of a churn, how to squeeze out half the buttermilk with a wooden spoon, how to shovel in the salt, and how to stow it away in streaks in a firkin. Judging from the butter one sees (and smells) in the markets, a majority of them consider this the whole of the "fixed science." Those who know more about it know very much less, and there is not a single item of the process from the selection of the cow to the packing for market on which they do not crave more light and need more. We are, after all these centuries, on the very eve of knowledge, and those who first confess their ignorance and make the earliest attempts to learn are those to whom success and pecuniary reward will first come.

The royal road to good butter-making is not yet plain, but I believe that those who use Jersey or Guernsey cows, and who set their milk in deep cans (with cool water about them) have found its beginning.

The Blue-Gum Tree.—(*Eucalyptus globulus*.)

BY AL FRESKO.

Almost every newspaper or journal, American or foreign, that I pick up contains an article on the Eucalyptus or Blue-gum tree, lauding it to the skies for its powers of destroying malaria and preventing fevers. The other day I noticed an editorial suggestion in a leading New York paper to the effect that the tree should be extensively planted in the marshy regions in the neighborhood of the city so that malarial diseases might be entirely eradicated. As your journal spreads its influence over many lands, I have deemed it advisable to refer to this tree, in order to prevent disappointment. My experience is based upon a twelve years' residence in the home of the Eucalyptus, antipodean Australia. I am not prepared to give a definite opinion regarding the powers of this tree to annihilate the cause or causes of intermittent fevers; but think that the published statements regarding its sanitary powers should be received *cum grano salis*.

To use a horticultural expression, this tree is "tender," and will be seriously injured, if not entirely destroyed, by a cold ten degrees below freezing. When I left Australia, in 1865, I took with me some seed of this tree; and in 1868 presented a portion of it to an enthusiastic horticulturist of St. Augustine, Florida. The seed vegetated, and during the course of the ensuing summer made a healthy and vigorous growth. The succeeding winter at St. Augustine was marked for a low temperature, and the young wood of the orange trees was injured by the frost. I visited Florida in the July after the "cold spell," and upon inquiry found that the young Eucalyptus trees had been destroyed. It is to be hoped that no one in northern localities where intermittent fevers prevail will attempt the cultivation of this tree, for if they try the experiment they will shake twice instead of once—firstly from a chill and secondly from disappointment. Where the climate will admit of its cultivation (that is to say, where ice does not form over one-eighth of an inch in thickness) the tree is worthy of attention. When I speak of its value I do not base my estimate upon its worth as a sanitary agent, but refer to it as the most rapid-growing tree in existence, its desirability as a shade tree, its adaptability to almost any soil or situation, and its great value as a protector or wind-break in exposed situations. As an evidence of its rapidity of growth under favorable climatic conditions I will cite one case: About the year 1864 my friend Mr. Thos. Lamb, of Ballarat, Australia, read to me a portion of a letter received from Mr. McNabb, the

intelligent curator of the Botanic Garden of Natal, South Africa, in which the writer referred to the surprising growth made by the tree in that climate. He stated that he had measured a specimen that had been transplanted from a pot six years before, and that its height was 67 feet, and the diameter of the

any of the Atlantic States. It has been tried by skillful cultivators in Georgia and South Carolina, but with no better results than the trial in Florida quoted by our correspondent. It is singular that the influence of this tree to destroy malaria should not have been suspected in Australia; the story probably arose from the fact that a tincture of the leaves has been found useful in intermittent fevers.—[Ed.]

SNOWFLAKE.

trunk at one foot from the ground 17 inches. This specimen, grown in a warm, moist climate somewhat resembling that of the more favored portions of Florida, had made an annual growth of about eleven feet.

If planted as a specimen tree, the gum is symmetrical in its habit, branching from the ground, and assuming the form of a cone. If planted as a wind-break or protecting belt, the young trees should be placed in three rows about five feet apart. So planted it forms slender stems which yield to the force of the wind and do not break. The wood is very durable, and it is contended that when used

Beauty" originated with a Vermont farmer, Mr. E. S. Brownell, who states that it was produced by crossing the white Peachblow upon the Early Rose, and was first raised by him in 1870. It is properly called "Beauty," as it is, we think, the handsomest potato in appearance of any we have seen, it being remarkably fair and smooth and the skin of a fine reddish color. Great earliness is not claimed for this variety, it giving potatoes fit for the table about a week later than the Early Rose. We have not grown this variety, but have had two trials of it upon the table, and can testify to its excellent quality there. Mr. Brownell states that it has been

healthy in both tuber and vine; that it is a good cropper with but few small tubers; and that the potatoes grow compactly in the hill. This variety was sent last spring to England, with other varieties, to Dr. Masters, editor of the *Gardeners' Chronicle*, who sent specimens under numbers to the potato trial at the gardens of the Royal Horticultural Society at Chiswick. When the award was made last fall the number corresponding to Brownell's Beauty received a first-class certificate. The Snowflake is of medium size, very uniform in shape, white with a russet tinge, and has very few eyes. The engraving will give an idea of the size and form, and the writer of "Notes from the Pines" testifies to

BROWNELL'S BEAUTY

in ship-building it will last as long as teak.

[We entirely indorse our correspondent's views in regard to the Eucalyptus. The daily papers, with their usual disregard of accuracy in such matters, have made so much talk about the tree that already there are inquiries for seed, and probably some sharper may take advantage of the excitement and offer to supply the demand. The tree grows finely in California, but we have not heard of its success in

its quality on page 102. Among the newer kinds that have been especially successful in England as well as in this country, is that variety of the Early Rose called Thorburn's Late Rose, which has been highly commended for both quality and yield. "Excelsior" is an American variety that has acquired a greater reputation abroad than it has here, and the same may be said of the Climax, which stands very high in England, though little grown here.

Two New Potatoes.

Yes! two more new potatoes! And why not? It would be strange if among the hundreds of seedlings that have been raised within the past few years there were not some few that possessed qualities that entitled them to be generally cultivated. There are at least two new ones offered this year that are worthy of notice, "Brownell's Beauty" and "Snowflake," both of which are introduced by B. K. Bliss & Sons. "Brownell's

The Shetland Pony.

The pair of Shetland ponies whose portraits we here give is part of a herd which was recently imported from the Shetland Islands by Mr. John G. Correy, of Suisun City, California.

These islands are a small, rocky group, situated north of Scotland in the stormy North Atlantic Ocean. The fierce north winds sweep over them carrying the spray from the waves which wash their precipitous shores. As may be expected, therefore, the herbage of these islands is scant and coarse, although sweet and nutritious. These diminutive horses, never more than forty inches in height, and which feed in a semi-wild state upon these exposed, bleak pastures,

are fitted by nature for their peculiarly hard life, and possess exceedingly tough constitutions, a good deal of endurance and spirit, and are very docile. Formerly these animals possessed but little value, and were in very moderate demand as pets for children. But some years since the English Parliament prohibited the labor of women and children in coal-mines, and these small, hardy creatures were substituted, and used to draw the cars of coal along the narrow, low-roofed, dark underground passages.

Their value immediately increased, and their breeding became an established business. A largely increasing demand for them now exists, both for this special purpose and for the use of children. Their extreme docility and diminutive beauty expressly fit them to be children's pets. The animals pictured above were prize-takers at the last exhibition at Lerwick, the chief town of the Shetland Islands, and the stallion is the winner of several first prizes. It is very probable that these hardy animals may find a place in the mines of the far West similar to that which they fill in the Welsh coal mines; but if not, there is already a large demand for them in this country for children's use, and they will certainly find a congenial home upon the hills

of California. We understand that Mr. Correy was successful in getting his herd of over 30 animals home from their long journey of nearly 7,000 miles with a loss of only two, and that his enterprise has been rewarded with the profitable disposal of nearly the whole of them.

PAIR OF IMPORTED SHETLAND PONIES.

This fact shows to a great extent the extreme hardiness of these animals under exposure.

Ayrshire Cow—"Old Creamer."

The portrait of Old Creamer is taken from a photograph for which we are indebted to her owner, S. D. Hungerford, of Adams, Jefferson Co., N. Y. This cow was exhibited at the New York State Fair in 1873, where she took the

AYRSHIRE COW—"OLD CREAMER."

first prize as the best milk cow of any breed. She is an Ayrshire, nine years old, weighs 1,080 pounds, and is claimed to be the champion cow of the world. This is an extensive claim, but would seem to have some foundation when we learn that this cow in three days in June last gave 302 lbs. of milk, or 135 quarts—an average

of 45 quarts a day. Her average for the whole month of June was over 94 lbs. per day, for July 80 lbs., and for August 74 lbs. In eleven days in June she gave more than her own weight of milk. The performance of this cow, as well as that of Beacon Belle, another Ayr-

shire, whose portrait was engraved in the *Agriculturist* of November, 1873, shows in a very striking manner the value of the Ayrshires for the dairy. This breed having been subjected for many years past to very careful training and selection for that express purpose, is now without a rival for quantity of milk, while for excellence of quality it has but two superiors—viz., the Jersey with the Guernsey, and the Devon, these, however, being less productive in quantity. For the

cheese dairy this breed is the most profitable, and a singular fact recently made known by Dr. E. L. Sturtevant of Massachusetts goes to add much to its value. This fact, which has become known through much careful investigation by Dr. Sturtevant, is that the milk of the Ayrshire cow contains its cream in very small globules, which are separated from the milk only with extreme slowness and difficulty. In making cheese from Ayrshire milk, therefore, the cream remains in

the curd, adding much to its richness, and is not lost in the whey. The skimmed milk of the Ayrshire cow is therefore of equal value for cheese-making with the whole milk of cows of other breeds, the cream from which rises and separates very readily and rapidly. The cream from Jersey milk exists in large globules, which separate very quickly and completely from the milk, leaving a blue, poor liquid, quite unfit for the making of cheese. Jersey milk is

therefore only adapted for butter-making, while Ayrshire milk is well adapted for either whole cheese manufacture or partly butter and partly cheese-making. The Ayrshire cow therefore holds a place in the dairy in which she can never suffer in competition with any cow of any other breed whatsoever.

Walks and Talks on the Farm.—No. 123.

My big underdrain works grandly. It is pleasant to see a ten-inch pipe discharging water to its full capacity. It empties into an open ditch on the side of the road. The Deacon has a shallow, open drain that runs into the same ditch. This drain of the Deacon's is the natural outlet to the drainage of seventy or eighty acres of land, and during rainy weather and spring thaws there is a great body of water running through it; so much so that it spreads over several acres, and not unfrequently gets so high as to overflow the road. My big underdrain is the natural outlet to the drainage of about twenty acres, and I have diverted into it the drainage of some thirty or forty acres more, including the Deacon's "duck pond."

Now, what I want to say is this: The Deacon's open ditch only discharges the surface water. It runs for a week or two and then stops, leaving more or less water standing on the surface of the land, and the whole soil saturated with water, which is only got rid of by evaporation. Much of the land is not dry enough to plow before May or June, and a few hot days will then bake the "clay spots" until it is impossible to get them into good tilth.

Said the Deacon when I first commenced to drain: "If everybody should drain their land as you propose the rivers could not carry off the water, and our cities would be destroyed by the floods."

I told him that underdraining would do much to prevent floods, and this big underdrain of mine is an illustration in point. The first week of last January we had a great rain. It flooded the country and saturated all the land. The water came down with a rush from the Deacon's surface drain. From my underdrained land there was no surface water; it all came through the underdrain. But mark the difference. In a week or ten days we had freezing weather, and not a drop of water came from the Deacon's surface drain; but my big underdrain kept discharging a steady stream for days and weeks. The underdrains are from 2½ to 5 feet deep, and of course they are far below the frost. The water from springs and from the subsoil continues to flow into these drains all winter, or at any rate as long as there is any excess of water in the subsoil. On the Deacon's land no water will drain off during frosty weather. The land, both on the surface and in the subsoil, will be saturated.

Next spring, when the rains descend, they will fall on this soil, already full of water, and will pass off in a rush to the streams below. On the other hand, the rain on the drained land will slowly sink into the dry subsoil and will pass off gradually.

"I have just got a letter, Deacon," I said, "that I think will please you. In the fall of 1872 I sent three bushels of our white wheat to A. L. Clark & Son, of Hampshire Co., Mass. They sowed it on 1½ acre of land that had raised three successive crops of tobacco. It was sown September 12th and cut July 21st. The yield was 5,250 lbs., or 87½ bushels. The land was accurately measured, and contained 289 rods. The yield, therefore, was 48½ bushels per acre. This is not bad for old Massachusetts."

"We exhibited the wheat," they write, "at the Hampshire, Hampden, and Franklin Counties Fair, held in Northampton, and were awarded a premium for it and also for flour made from it. We sold 12 bushels for seed at

\$4 per bushel. We are haying the wheat made into Graham flour, and selling it at \$5.50 per 100 lbs. We drew five large and one small two-horse wagon loads of sheaves from the field, and the straw is worth \$20 per ton at the barn."

That is a big story. I told Ellwanger & Barry that Massachusetts had beaten them, and they said they would try again. It won't do to have New England raise more wheat per acre than Western New York. Just figure up what this 1½ acre of wheat brought in, assuming that a bushel of wheat would give 100 lbs. of straw.

Receipts from 1½ acre of wheat:
12 bushels, sold for seed, at \$4..... \$48.00
75½ bushels, say 4,379 lbs., Graham flour..... 240.84
8,750 lbs. straw, at \$20 per ton..... 87.50
\$376.34

"That is more money," says the Deacon, "than some of us made last year from our whole farm."

There is money to be made in farming yet, if we only raise big crops. We can raise just as good wheat now and as much per acre as we ever could, provided we make the land dry, rich, and clean.

I wish our young farmers would wake up to this fact. I wish they could feel that there is as much to be learned and as much to be done in agriculture as there ever was. There is a grand field for all the intelligence, skill, science, energy, and experience they can bring to bear.

Any real improvement in an agricultural implement or machine is welcomed by thousands and tens of thousands of farmers. Good breeds of horses, cattle, sheep, pigs, and poultry are in great and increasing demand.

"But will it continue?" asked the Deacon, who seemed to be tired of this kind of talk.

Certainly it will continue. The demand will be greater and greater as the general character of our agriculture improves. The world needs more and better meat and will be willing to pay for it.

There are on my table some fifty or more letters from farmers in different parts of the country. I like to get letters, but I do not like to answer them; and I fear a great many of my correspondents are offended.

"Read a few of them," says the Deacon.

Here is one from J. G. Smith, of Montana Territory: "What will you charge me for fifty head of Cotswold ewes and two rams? Our country here is, I think, peculiarly adapted for sheep—a very dry atmosphere, with open winters and abundance of good feed. There is not over 10,000 head of sheep in the Territory, and they are driven here from Salt Lake and Oregon for the butchers, selling at from \$8 to \$12 per head. The country is overrun with horned stock, with no demand except for home consumption. Flour sells for \$4 per barrel; oats 35c., barley 50c., and wheat 40c. per bushel; dressed pigs 8c. to 10c. per pound. The trio of Essex I got from you are doing well."

"That is a very interesting letter," says the Deacon; "what did you tell him?"

I told him he had better buy some common ewes in the Territory and cross them with a well-wooled, rather small Cotswold ram, and not go so extensively into the raising of high-bred sheep. One or two crosses would make an immense improvement in the native sheep.

"Which is the best way to use the droppings from the hen-house?" asks the next letter.

"Mix them with ashes and plaster, and put them on the hills of corn is my plan," says the Deacon.

"Mine," I replied, "is to put them into the manure heap."

The next letter asks several questions in regard to the management of manure.

"I let mine stay in the yards and sheds until spring," says the Deacon, "and then draw it on to sod land and plow it under for corn. I think I make twice as much manure in proportion to the number of animals as you do."

"Yes; twice the bulk," I replied, "but not half the value. One ton of my manure is worth more than four tons of yours. Your manure consists principally of rotten straw and water—or at least this would be the case if the straw was rotten. The way I manage my manure the present winter is this: I cut up every pound of straw and stalks and hay and clover-seed straw with an eight-horse power machine. I keep 7 horses, 10 cows, 75 pigs, and 120 sheep."

"I thought you had more pigs," said the Deacon.

These are all I have wintered over. I sell my young pigs at two months old, and never sold so close as last fall. If I have good luck I shall have over 200 young pigs in the spring. The pigs are my best manure makers. The great trouble is to get bedding enough. I could make a great pile of manure if I could use straw as freely as many of our farmers do. My two principal objects are to save all the liquid and to keep the manure slowly fermenting in a heap all winter. The horse-stall is of course cleaned out twice every day, but instead of throwing the manure out of doors to be wet with rain and snow we throw it into an empty stall by the door. Here it remains until we have a load of it. We then take this dry horse manure and use it for bedding the pigs. The dry manure from the sheep sheds is used in the same way. In the center of the barn-yard is a large basin with an old oil-barrel sunk in the ground for a tank. In the fall I tell my men to "start a hot-bed" in the basin. This is an important point. If they had their own way they would scatter the manure all over the basin, where it would be exposed to the rains and be frozen in winter. When put in a compact heap, and the manure leveled down every day as it is wheeled to the heap, an active fermentation is kept up all winter. The sides and top freeze a little, but the center is a mass of steaming-hot manure. There is no loss of ammonia. We put planks from the barn doors on to the heap and wheel the manure on top and spread it. If you do not spread it at once it will freeze. It looks now as though this heap of manure would be in splendid condition for root crops next spring without turning. I propose to sow 14 acres of mangel-wurzels where I had corn last year, and shall use this manure for them. I shall spread the manure on the surface, harrow thoroughly so as to mix it with the soil, then plow it under and drill in the mangels on the flat.

"Would not the hen manure," asked the Deacon, "be good for mangels?"

Certainly it would. Nothing better. But it is a drop in the bucket. And when I put it in the manure pile not a pound of it is lost. It finds its way to the field, and I have no trouble with it. Besides, it is a capital thing to start fermentation in the manure pile or hot-bed. Depend upon it, this is the right way to use

hen manure, bone-dust, horn shavings, refuse wool, hair, blood, or any other animal or inorganic matter.

"Is it better to plow under the manure or apply it on the surface?"

Whichever is most convenient. The real point is to make rich manure and get it thoroughly decomposed without loss before putting it on the land. Then use it on some crop that will appropriate it at once. Of course, a good deal can be said in favor of manuring the soil rather than of manuring the crop. It depends on circumstances. The Deacon thinks long, strawy manure is worth more for lightening the soil and making it porous than for its plant-food. I am not sure but he is right, for it is certain that such manure as is made almost wholly from straw does not contain much plant-food.

The next letter is about petroleum. But I have told all I know about it. It is good to preserve wood. It is not good for paint. The easiest way to apply it to the shingles on a roof is to stop up the gutters. Then take the petroleum on to the top of the roof in a watering-can and sprinkle the whole roof with it two or three times. The more you can get it to absorb the better. If any of the petroleum runs into the gutter apply it with a brush to the shingles below the gutter. I use two or three barrels a year. The price varies. I have paid as high as \$10 per barrel. I have just bought two barrels of 42 gallons each for \$7 per bbl. This includes the barrels. They offer me \$1 each for the barrels. But I find them very convenient on the farm. They do not shrink in the sun. Sawn in two they make capital watering troughs.

"R. P. W." writes from Nebraska that he is in the sheep business. He keeps 300 sheep, and has only lost six in ten months. He feeds prairie hay and corn in winter. Little timothy is raised. The prairie grass gives out on the first frost, and he wants something for late fall and early spring feed. He asks about rape and mustard. The latter will not stand frost. The former will. As long as prairie hay and corn are so abundant, I should doubt if it would pay to raise either mustard or rape. I should try Kentucky blue grass and timothy. Keep the stock off of it after July, and use it as a late fall and winter run for the sheep, feeding prairie hay and corn as well. He asks if long-wooled sheep will do well in flocks of five hundred. The size of the flock has little to do with the matter. It is a question of care and food. With dry winter quarters and an unfailling supply of food and water, with a good run on dry land in winter, I see no reason why long-wooled sheep can not be kept in as large flocks as Merinos. I have Cotswold sheep, grade Cotswolds, and Merinos running in the same flock, and the Cotswolds and their grades keep fatter, grow faster, and yield more wool than the Merinos. But they are larger sheep, and of course eat much more food. They have no better food, however, than the Merinos. All run together and are fed alike. I have only half a dozen Merino ewes, which I keep to raise lambs for my own eating. They look very forlorn by the side of a two hundred and fifty pound Cotswold. Visitors often say that the Cotswolds starve the Merinos. It has usually been thought that Merinos, being more active, would starve the Cotswolds. If I lived in Nebraska I am not sure that I should keep

long-wooled sheep. The Merinos can rough it better, and where there is no demand for lambs or mutton I certainly should not keep any of the English breeds of mutton sheep.

"That is sound," says the Deacon. "We do not want the West to compete with us in raising mutton and long wool. What is your next letter?"

It is from "R. R. H.," of Rockton, Ontario. He has a field of clover, mown for hay and seed last year. It will be sown to wheat next fall. He has drawn his winter manure into the field as fast as it was made and put it in a pile. It is fermenting enough, he says, to keep the snow melted on top. The field will be pastured until June. Then turn out the cattle, and allow the clover to grow to August. Then plow under the clover, harrow, and cultivate until the beginning of September, and then drill in the wheat. "Now," he writes, "will it be better to apply the manure on the clover in the spring or rot it thoroughly through the summer and spread it on the land just before drilling in the wheat? The soil is a sandy loam."—That is a well put question. It will be better for the land in the end to apply the manure to the clover in the spring; but he will probably get more wheat if he can keep the manure over in good condition until fall, and then spread it on the furrows and harrow it in before drilling. I adopted this plan on part of my wheat last year. But I kept the manure in the basin in the yard, where I could pump the drainage water on it when necessary.

"If I had such a field," says the Deacon, "I would plow under the manure in May or June, drill in with beans, and sow wheat in the fall. You did so once, and had a good crop of beans and a big crop of wheat after them."

It is a capital plan when your land is rich.

Making Rich Manure.

Last month we gave some illustrations of a method of feeding stock in covered sheds. We now desire to show the value of the manure so made. The greatest need of our farming just now is, and in the future will be, the production of rich manure, and until every farm shall have a few feeding animals kept expressly with a view to the manufacture of manure, our agriculture will fail of securing its greatest profits. The present system of making and keeping manure is a most wasteful one. It is safe to say that at least fifty per cent of the value of manure is lost by its exposure to the weather during a whole winter, at least under ordinary circumstances.

Although we have never made exact experiments, yet having during one winter kept several head of stock in a covered shed, constantly well bedded with straw, and allowed the manure to accumulate until spring beneath the cattle, we can testify to the merits of this system of feeding under cover. The stock were kept in the best of health. They exhibited the greatest contentment. They were cared for and kept clean by carding with the least trouble of any of our stock. The manure when removed in the spring was in the finest condition and showed its value by bringing a crop of potatoes, for which it was used, equal to 450 bushels of Early Rose and 600 of Harrison potatoes per acre respectively. When, therefore, we call attention to the following experiments by a prominent English farmer, it is with perfect confidence, as we have realized somewhat of

the same results in our own experience. The experiments to which we refer were made by Lord Kinnaird, a large Scotch land-owner and farmer who has followed the practice for over 20 years of feeding his cattle in covered courts or sheds in which the manure accumulates beneath the cattle during the whole winter or feeding season. Recently Lord Kinnaird planted potatoes upon four acres of land. Two acres were manured from the covered stalls or sheds, and two with barnyard manure of the ordinary kind. The character of the soil was exactly similar upon each of the plots, and they adjoined each other. The crops were as follows: Upon one acre with covered manure the yield was 472 bushels, and upon the other acre 443 bushels. With ordinary manure from the open barnyard the yield was 272 and 297 bushels upon each acre respectively. The following year these plots were sown with wheat, and the crops were, upon the first mentioned acres 55 bushels 5 pounds and 53 bushels 47 pounds; upon the last mentioned, 41 bushels 19 pounds and 43 bushels 38 pounds respectively. The difference in yield shows the extra value of the covered manure. In our own case 14 head of young stock (two-year old heifers) were fed in a lean-to shed (40 x 12), the lumber for which cost less than \$30, and the labor in putting it up less than \$5. They were fed upon cut corn-stalks, bran, and corn-meal from October to April, and were bedded with wheat straw quite plentifully. All through a cold winter the manure never became frozen, and it made a mass of the most compact kind three feet deep, so that there were 1,440 cubic feet or over 11 cords, which if it had been as loose as ordinary barnyard manure would have measured nearly twice as much. The slow fermentation it had undergone had completely rotted the straw and reduced it to the finest condition, so that it was removed with the greatest ease. The absence of any evaporation or exposure to the weather doubtless fully doubled the value of the manure, to say nothing of the saving of labor in the making and final handling of it.

THE USE OF SALT FOR STOCK.—While a certain amount of salt is absolutely necessary for the health of stock, it by no means follows that its indiscriminate use is either needful or safe. On the contrary, salt used in excessive quantities is highly dangerous. It then acts upon the stomach and intestines as an irritant poison, and cases of death have occurred through permitting cattle and hogs to consume too much of it. When stock are allowed free access to it they will take a small quantity very often, but if denied a frequent supply they become ravenous for it, and are in danger of eating it to excess. The safest way is to use a small quantity regularly in the food; a quarter of an ounce daily being amply sufficient for a cow or a horse, and a fourth of that quantity for a hog or a sheep. If stock are salted once a week no more than one ounce at a time should be given to a cow, and a quarter of an ounce to a sheep or hog. It should also be given in such a manner that no one animal should eat more than its share. It may be given scattered thinly in the feeding trough with more safety than in any other way excepting when it is mixed with the feed. Regularity in its use is the most conducive to the health of the cattle. We find it necessary to give this caution because some of our readers have been led to suppose, very erroneously, that as salt is a good thing, stock can not have too much of it.

A Butter Dairy.

There is no article of food produced that depends for its excellence so much upon the neat-

New York. The churning is done by horse-power, and the position of the power outside of the building is seen in the engraving. The motion is given to the churns by a crank and

passes through these pipes into the milk room, filling it, and displacing the warmer air, which is forced out through the ventilators in the ceiling. In this manner the necessary regular temperature is kept in the milk room, without regard to the degree of cold or heat which may exist outside. The size of the milk room is 16 x 16 feet; it has but one window, and that upon the north side.

Fig. 1.—ELEVATION OF DAIRY.

ness, skillfulness, and perfect cleanliness of its manufacture as butter. We have heretofore given descriptions of a dairy managed upon the deep-can system with a cold water tank. We here give engravings with description of one managed upon the prevalent shallow-pan system, the pans used being the common tin ones holding about ten quarts.

The building should be of stone, or if of wood it should be built with at least six-inch studs, and be closely boarded with joints broken upon the studs and battened, and the inside well lathed and plastered. For thirty cows the size required would be 36 by 16 and 10 feet high, with 26 feet of it sunk four feet below the ground. In this sunken part the milk room and ice house are placed, the other portion being used for the churning room. Steps lead from the churning room down into the milk room. The ceiling is plastered, and an attic is left above to keep the rooms cool; a ventilator also opens from the milk room and passes through the roof. Figure 1 shows the general

oscillating rod. Figure 2 shows the interior of the churning room, in which double churns of the ordinary barrel shape are used. This room contains a pump, sink, and wash bench. The butter when churned is worked by a lever worker, the buttermilk being absorbed by a sponge which is kept clean by cold water.

Figure 3 shows the milk room, four feet below the level of the churning room. There are three ranges of shelves around this room, with a table in the center. In the winter this room is kept at a regular temperature of 60° by means of a stove, and in summer is cooled to the same temperature by an inflow of cold air from the ice house which adjoins it. This is admitted through two openings, seen in the wall at the right just above the lower shelf. Figure 4 shows the arrangement of these cold-air pipes in the ice house. A tube passes downwards through the center of the ice, and at the bottom of the ice branches into two arms which are made to turn at right angles, and after passing through the ice appear in the

Bucket for Water Wheels.

Many inquiries reach us as to the best form of bucket for small water-wheels for farm purposes, such as pumping, churning, etc. In reply to such, and more especially to one now before us from a correspondent at Whitley Co., Indiana, which represents many others, we describe a form of bucket which the writer has used with advantage. The main idea in shaping the bucket is to hold the water as long as possible, but at the same time to let it escape at the moment when its power is exhausted in such a manner that it shall not hold the wheel, as it is termed, or that it shall not, by reason of a vacuum being formed in the bucket while it is escaping, be held so that the wheel shall be forced to carry it up some distance before it can be all discharged. This is a point of great difficulty, and can not be secured by any particular form of the bucket, but may be by inserting valves in the lower part of the bucket

Fig. 4.—ICE HOUSE AND PIPES

by which air may be admitted and any vacuum be rendered impossible. Without entering into

Fig. 2.—INTERIOR OF CHURNING ROOM.

Fig. 3.—INTERIOR OF MILK ROOM.

elevation of the dairy, which is one belonging to a successful dairy farmer in the State of

wall of the milk room. Whenever desirable, a current of cold air, moved by its own gravity,

any of the scientific reasons why the particular form of bucket here described is of advantage,

we simply give the accompanying engraving showing its form, with directions for laying it out upon the sides of the wheel. The engraving represents the circumference of the wheel with the shrouding which forms the sides of the buckets. This shrouding should be divided into three equal parts, which the one included between the inner circle and the dotted line *a, a* will be equal to the length of the starts or soles of the buckets, *b, b*. These should be laid out in the direction of radii from the center or the axis of the wheel, as shown by the dotted lines *c, c*. These lines or radii should be carried out to the outer circumference of the shrouding, as seen in the lines *c, c* in figure 1. The flats of the buckets should then be laid out from the extremity of the starts or soles to the point where the preceding lines touch the circumference, as seen in the dark lines *c, c*. The

Fig. 1.—LAYING OUT THE WHEEL.

lines should coincide with the number of buckets desired. For these no particular rule can be laid down in these cases, as they will depend upon the length of the buckets and the quantity of water to be used. This form of bucket meets the chief requirements of cases where the

Fig. 2.—VALVES FOR BUCKET.

greatest economy of water is not an object, and will answer every purpose where it is not desirable to employ a skilled millwright. To enable the water to leave the wheel promptly when it runs in tail water a valve or valves of leather weighted with sheet-lead may be affixed to the soles of the buckets, as shown at *b, fig. 1*. As the buckets rise out of the tail water these valves will open and admit air, which will cause the water to escape at once. This simple contrivance has very much increased the power of a wooden wheel to which it has been applied. The way in which the valves are applied to the soles of the buckets is shown in *fig. 2*. They are self-acting, as will be readily understood.

Portable Fence for Poultry Yard.

"E. B.," Ann Arbor, Mich., asks for a portable fence for a poultry yard. Such a fence may be constructed as follows: A post three inches square may be driven or set in the ground and braced, as in the accompanying en-

graving, *fig. 1*. This post is provided with two hooks similar to those upon which gates are hung. Bars of light stuff, which need not be

Fig. 1.—PORTABLE FENCE.

heavier than $1\frac{1}{2}$ inch thick by 2 inches wide, are then provided of such a length as the panels may be desired (see *a, fig. 2*). These bars are furnished with eyes at each end, which fit hooks upon the posts. They are also grooved at such distances apart as the pickets are to be placed, or say four inches. The grooves are cut half an inch deep, and large enough to allow a $3\frac{1}{4}$ -inch nail to lie in them and no more. The pickets (*b, fig. 2*) may be made one inch square, and as long as may be desired. If the poultry are heavy-bodied birds, five feet will be enough, as also if the birds are light and have the wings cut. These pickets are bored with holes to receive a $3\frac{1}{4}$ -inch nail, either wrought nails or cut nails which have been annealed. The nails are driven through the pickets in the proper places, and as the pickets are placed in position the nails occupy the grooves in the bars. The points of the nails are then turned down, forming hooks by which the pickets are kept in their places. When the fence is to be moved it may be taken apart and set up in another place with great facility. *Fig. 3* shows a panel of the fence as completed.

BLACK-LEG IN CALVES.—"J. W. R.," Greencastle, Ind. In the spring or the fall, when the feed is changed either from dry to green or from green to dry, it is not uncommon for calves and young cattle to be affected with a very rapidly fatal disease known as black leg. First lameness is noticed in the fore or hind, but generally the hind quarters; the eyes are bloodshot, and the mouth and tongue are hot and blistered. The swellings crackle as the hands are passed over them; and after death, which is generally very rapid, the flesh beneath the swollen parts is black and suffused with

readily be prevented by care at this season. Towards the approach of spring the young animals should be given a pound of linseed-cake meal daily, and the condition of the bowels should be watched. If the dung is hard, and covered with slime or mucus, a few ounces of Epsom salts should be given; when the animals are turned out in the spring to grass it should be for an hour or two only at a time for a few days; and the first appearance of fever should be treated with a brisk purge.

Plan for a Commodious Barn.

W. P., Benton, Grafton Co., N. H., sends us plans and description of a barn built by him upon a farm of 130 acres upon which mixed farming is practiced.

The main building is 108 feet long by 40 feet wide, with 20-foot posts. The wing at the right is 82 feet long by 30 feet wide, with 15-foot posts. The left wing is 40 feet long by 16 feet wide with 12-foot posts. There is a cellar under the main barn 10 feet deep, 80 feet long, and 40 feet wide. As is seen by the engraving, *figure 1*, which shows the elevation, the barn is built upon a hill-side, with three stories. The main floor, of which *figure 2* shows the plan, is reached by a bridge (*B*) which inclines two inches to the foot. *A* is the main floor; *C, C, C* are bays; *D, D* are shoots to the granary; *E, E* are stairs to the floor below; *F, F, F* are hay shoots to the horse stables; *G, G*, store rooms for wool; *H*, chimney, with an 8-inch wall and two flues, one of which is for ventilation.

2.—BARS AND PICKETS.

Figure 3 shows the floor containing horse stalls, feed and cook rooms, repair and work rooms, milk room, and shoots for feeding the

Fig. 3.—PANEL OF FENCE.

stock in the stalls and pens beneath, and for passing straw and manure. *A, A* are bays; *B* is the granary; *C, C* are feeding shoots for the cattle below; *D, D*, the passage; *E*, store-room for tools; *F, F*, horse stalls; *G*, manure scuttle; *H*, straw scuttle; *I, I*, stairs; *J, J*, water boxes; *K*, trap for feeding hogs; *L*, wagon

Fig. 1.—ELEVATION OF BARN.

blood. It is almost impossible to cure this disease when arrived at this last stage. It may shed; *M*, steaming or cooking room, which is of brick lined with zinc or sheet-iron, so as to

be fire-proof; N, chimney; O, repair room; P, work room; Q, sink and drain; R, trap for skimmed milk, leading to hog pens; S, milk room with racks.

Figure 4 shows: A, the manure cellar for the

Fig. 2.—PLAN OF MAIN FLOOR.

horse stables, also for store hogs; B, B are pens for fattening swine; with troughs at C, C and doors at D, D. The partitions between the pens are of planks, and may be removed so as to make but one apartment of them if needed for other purposes. E is the stairs; F, water box; G, G, stables for cattle; H, ox stable; I, passage for feeding grain or roots; each stall

Fig. 3.—HORSE STALL, FEED ROOM, ETC.

being provided with a slide for passing in the feed; S, S are scuttles for manure; T, T, gutters for manure; J, pen for calves, furnished with stanchions and places for milk; K, a loose box

Fig. 4.—PLAN OF CELLAR AND PENS.

or hospital for sick animals or incoming cows; L is the lower floor, 14 feet below main floor; M, hay shoot; N, N, bays; O, loft of shed;

P, hennery with large windows; Q, stairs; R, roosts.

Figure 5 shows the cross section at X, figure 4; A is the main floor, 13 feet wide, 94 feet long; B, B are bays; C, C, loft; D, D, feed passages; E, E, racks; F, F, stables. Figure 6 shows the manure cellar. B, B, place for sheep or young stock; C, C, water boxes; D, D, stairs; E, lower room of hennery.

Fig. 5.—CROSS-SECTION.

As will be readily perceived, this plan of barn is adapted to the requirements of a much larger barn, and for a farm upon which the production of manure by high feeding is one of the chief objects aimed at. Its cost is about \$2,800.

VALUE OF ARAB BLOOD.—From the special reports made to the war department of Prussia during the French war as to the efficiency of the cavalry service, we learn that the breed which exhibited the greatest endurance during that war was the East Prussian horse, a race which has a large infusion of Arab blood. They were able to carry a heavier weight than any other race of horses in use in the German cavalry, and far exceeded in endurance even the English troop horses, they also resisted exposure and hardship more successfully, and kept in better condition upon a smaller ration of forage. The captured French horses although much heavier than the Prussian horses, were found to be very inferior. Here is an authentic and strong corroboration of the general opinion as to the value of a thoroughbred cross upon our work horses, or at least upon those in which activity, strength, and endurance are desirable qualities.

Fig. 6.—MANURE CELLAR.

A LITTLE FARM WELL TILLED.—In the last volume of the Journal of the Royal Agricultural Society of England there is described a farm in Ireland consisting of 13 acres, occupied by a Patrick Clear. The report describing the condition of this small farm, for which the tenant pays a rent of six dollars and a quarter per acre, says the little farm, including cottage, out-houses, and yards, is a model of neatness. The crops were grass, oats, roots, and barley in a four-course rotation. There were two acres in permanent grass, which was kept for pasture for three cows and a horse. The young grass for mowing is top-dressed with guano and compost. The root crops were good and were perfectly free from weeds. The headlands of the fields were planted with cabbages, and there was not a vacant spot upon the farm. The hedges and gates were in good order. A good many pigs and a large number of poultry are raised every year. The calves are fattened and sold for veal. The stubbles are all subsoiled and fall-plowed. This little but excellently managed farm is a good illustration of what may be done upon a very small piece of land by thorough cultivation.

Pupil Farmers.

The old system of apprenticeship had its merits. Although shorn of its ancient usages and bonds it exists to a great and useful extent to-day. That it is gradually coming into use upon the farm is a proof that farming is attaining the rank of an established business in the full significance of the term. Anciently the weaver or "webster," the butcher, the skinner, or "fletcher," the smith, the tailor, or "taylor," and other tradesmen taught their sons their trades as they gave them their names, and the trade became the property of the family as much as the name. No stranger intermeddled with their trades. Such competition was rarely permitted. But society has outgrown this state of things, and the son, not bound by the ancient tyranny of a parental despotism, leaves the farm for other employments. As he quits the farm so other boys leave other homes and seek the farm, or they would do so if opportunities were presented to them. Such opportunities it was hoped would be presented by the agricultural colleges, but that idea has not as yet been realized to any extent. The only resource for such youths or young men is to become pupils of some successful farmer, and learn their business or trade in a thoroughly practical manner, without being hampered with studies for which they have no use. In England and other countries the agricultural journals contain numerous advertisements from farmers who desire pupils, and from young men who desire to become pupils, and the same system is already originating here. Not long ago a case in which we were the means of bringing master and pupil together, has resulted so satisfactorily to both parties that we recommend its repetition in other instances. Doubtless there are many successful farmers who would receive pupils, and hundreds of young men who would gladly seize upon an opportunity of becoming pupils to such farmers. We so very frequently receive applications from young men desiring to learn stock farming or dairy farming in the West, or general farming in the East, that it would be of great service to them should those farmers or dairymen who desire to receive pupils make it known publicly through the columns devoted to business matters. But none should enter upon this work unless entirely competent.

A Safe Cattle Tie.

We recently met with a case in which a careful farmer, making the usual rounds of his stables the last thing before retiring at night, discovered a valuable cow fast with its foot over the halter, the halter being fastened to a strap around the animal's neck and to a hole in the feed trough. It was extremely probable that the cow would have been strangled before morning had she not been relieved. There are two things to be learned from this accident. The one is that no farmer should neglect the practice of seeing that all is right with his stock the last thing at night. The other is that such a fastening as above described is very unsafe for either cattle or horses. A tie that is as safe as probably any tie can be made is here shown. It is one that we have used for cattle, both oxen and cows, for several years without any accident or mishap whatever. A ring or eye-bolt is securely fastened in the side of the stall above the level of the feed trough. Through this ring the rope tie is passed. One

end of the rope is passed through a block of wood and knotted so that it can not be drawn out. This end hangs down below the ring. The other end is also knotted in such a way that the knot can not slip. This end of the rope is passed around the horns of the cattle so as not to be too tight, and the knot at this end is put through a loop made in the rope at

A SAFE CATTLE TIE.

such a distance from the end as to leave sufficient length to go around the horns. When the cattle are up the slack of the tie is drawn down by the weight of the wooden block, making it impossible for the animal to get its foot over it. When they are lying down the block is drawn upwards, but still keeps the rope safely out of the way. We have found this tie equally useful for horses.

Three-Horse Whipple-Trees.

A set of three-horse whipple-trees is shown in the engraving here given. They are arranged upon a compensating plan, by which the middle horse has twice as great a length of the whipple-trees as each outside horse, thus

THREE-HORSE WHIPPLE-TREE.

equalizing the amount of draft. The engraving shows this so clearly that it is only necessary to follow the plan exactly in making the whipple-trees. They are connected together by ordinary clevises and bolts.

MIXED GRASS.—At the annual meeting of the Mass. Agricultural Ass., a paper was read upon growing grass. In the discussion which followed it was remarked that farmers should be careful to sow together only those grasses which ripen at the same time. This is a mistaken idea. The chief reason why a variety of grasses should be sown is that there may be a constant succession of growth. The weakest point of our meadows is that the grass ripens, fades, and suspends growth for the season, leaving a brown, withered, or bare surface. If there were a succession of consecutively ripening grasses there would be a continued greenness and verdure, and if the pastures were only not overstocked this would be as great an approach as we can make with our peculiar climate towards a permanently green meadow or pasture. But if all the grasses ripen at once

we may as well continue to grow one single good grass as several good and bad ones.

Butter and Cheese Dairying.

We have watched with great interest the progress of the "dairymen's conventions" which were held during the month of January. Feeling the importance of these institutions to the interests represented by them we devoted some time to attend them. We may say that we were particularly interested and gratified with the energy, enterprise, and intelligence exhibited by the Associated Dairymen. The papers read at these meetings were of great merit and usefulness, and the speeches and discussions which followed the remarks of the orators were marked by great practical experience and intelligence. This fact promises well for the continued success of the dairy interest, which now represents an annual value of nearly 500 millions of dollars. The cheese manufacture of the country is expanding with great rapidity, and its expansion is but the natural consequence of a vast improvement in quality. The renowned Cheshire and Cheddar cheese of England is to some extent met and vanquished upon its own ground by American cheese. Many brands of American make are sought for with avidity by English dealers. Twenty years ago American cheese was a drug in the English market. But the factory system has not only changed all that, but it has from its inherent value and excellence forced its recognition and adoption by English cheese-makers. And this is but the beginning of the existence of the cheese industry of this country, for the home consumption has hardly as yet been created. To stimulate this growth and encourage an extensive home market the attention of dairymen needs now to be turned, and the tastes and demands of consumers must be learned and met. As regards butter, dairymen have much to learn, especially those of the West. The quality of the butter that comes to market is in large part wretchedly bad. This is the consequence of faulty feeding, of careless churning, but in far greater part of improper packing. The produce dealers are also to blame to some extent for this. It is true that low-priced butter is needed for a portion of the consumers who are poor and can only afford to buy a cheap article; but it costs no more money to make a fair tub of butter than a poor one, while its value is about double that of the poor one. The secret is almost entirely in cleanliness—clean feeding, clean milking, clean keeping and churning, and last, but really the most important of all, clean packing. We are glad to believe that the meetings of the dairymen will gradually lead to improvements in these respects, and we propose to work for that end along with them.

PERMANENT GRASS.—Water meadows are amongst the most productive of permanent grass lands. But the management of water meadows is very frequently injudicious. No cattle should be allowed upon an irrigated meadow, nor should the water be permitted to run continually over one spot. A meadow thus treated very soon becomes a morass, and is then spoiled. A dressing of bone-dust is remarkably beneficial to water meadows, greatly thickening the grass and improving the quality of the hay. An application of plaster the next year still further improves the meadow. As soon as the hay becomes inferior in quality and decreases in quantity it is restored by a repeti-

tion of this treatment. The opportunities for making water meadows are frequent, and as their value becomes appreciated they will become much more common than they now are.

THE VALUE OF SKILL.—In the report of the Ayrshire Agricultural Association recently held in Scotland, we read of an Ayrshire dairyman who had been in the habit of making Dunlop cheese, the common cheese of the country, but on changing his make to that of Cheddar cheese realized an additional profit of \$5,000 in five years. The Cheddar is classed amongst the fancy cheeses and brings a high price; but as there is nothing needed in its manufacture but an extra amount of care and skill, we see how the exercise of these qualities pays in comparison with simple labor. Amongst ourselves there is a great opening for the profitable exercise of skillful dairying in the making of cheese, to meet a large demand for something of extra quality and attractive and convenient form.

IN AND IN BREEDING.—In building up a breed or race of cattle some of the most noted and scientific breeders have resorted to very close breeding. They have not scrupled to use bulls upon their own dams or heifers when by doing so some desired point was to be secured. But it by no means follows that this practice is to be adopted as a rule. A scientific and successful stock breeder is one of a thousand, and while he may be successful in some of his ventures—and, as it must be remembered, we do not hear of his failures, the evidence of which he instantly destroys to save his reputation—others may find that his methods may be to them merely playing ignorantly with edge-tools.

SALT FOR HOGS.—The unrestrained appetite of swine will often lead them to consume things that are highly injurious to them. Cases of poisoning by partaking of excessive quantities of salt often occur amongst hogs at this season when beef and pork barrels are emptied of the old brine and refuse salt. A case in which several hogs were thus lost in England, was recently noted. Hogs require a certain amount of salt as do other animals, but it should be given to them with caution, and either evenly mixed in their feed or scattered very thinly about their troughs, so that one more greedy than another can not take more than its proper share.

A Punch for a Bull's Nose.

The uncertainty of a bull's temper renders it necessary that he be held in safe control. He is only safe when held by a strong ring in his nose. We have before described one method of ringing a bull (*American Agriculturist*, June, 1872). We now figure a punch for piercing the hole in the cartilage between the nostrils by which the

PUNCH FOR A BULL'S NOSE.

operation is rendered easier and safer. It is made of similar shape to a pair of common pincers of large size. One of the jaws is provided with a hollow punch of conical form which takes out a round piece of the cartilage. The bull should be tied by the horns and seized

in the proper place by the punch, when the perforation of the cartilage is the work of an instant. During the operation the animal is powerless, for the handles of the punch being curved and made with knobs at the ends furnish a very secure means of holding him while

the separator, the cleaned grain runs through spouts into hoppers or bins, in which it is stored, or from whence it is passed through the pipes seen in fig. 2 to the stones. Here it is ground, and the meal, considerably heated by the friction of the stones during the process of grind-

passes, upon which tin cups are fastened. The strap passes over a pulley at the top and another at the bottom of the elevator, and as the cups pass up they scoop up the flour as it pours into the box at the bottom and carry it upwards, throwing it out as they pass over the

Fig. 1.—SEPARATOR.

the ring is being made ready. The hole being perfectly round too, heals again very quickly, and can not tear open as a three-cornered hole might do. The operation of ringing should be performed before a bull becomes a year old. Then he is always in a state of subjection, and not knowing what it is to successfully resist his keeper is not so apt to try to do it as when older.

The Flouring-Mill.

Much of the grain which arrives at the Eastern ports is ground into flour for consumption or for export to foreign countries. Some of the flouring mills engaged in this business are

ing, is cooled by being carried up through an elevator two or three stories above to the bolts, fig. 3. The bolts consist of long reels covered with very fine and costly silk cloth. This bolting cloth is made only in Holland, and is of various degrees of fineness. Each long reel is covered with cloth of three qualities in such a way that the bolt is divided into three partitions as it were. Through the first of these the finest flour is sifted; the second separates the second quality or coarse flour; and the third the shorts, middlings, or fine "mill stuff," which is either taken by a spout or conveyed into the stones and ground over, or it is kept apart to be sold for feed. In the largest mills there are three separate bolts or reels, as seen

upper pulley into other spouts. The conveyers are horizontal pipes or spouts, in which rods furnished with screws similar to the propellers of steamboats push the flour along. The packers are large conical receivers into which the finished flour is gathered. The barrels are placed beneath them, and as the flour pours into the barrels a revolving screw presses the flour down closely into them until they are filled. They are then weighed, 196 pounds of flour being put into each one, and are headed up. The last operation the flour undergoes is inspection. The inspector bores a hole through the head of the barrel, inspects the quality of the contents, and marks the appropriate brand upon the head. It is not necessary, however,

Fig. 3.—BOLTING MACHINE.

very large, and turn out several hundreds of barrels of flour daily, a few even grinding a thousand barrels or more every twenty-four hours. The accompanying illustrations represent the interior of one of these mills of a comparatively moderate size. Generally the mill is a solid brick or stone structure of six or seven stories. The grain is elevated to the top story, where it is passed into the smut machine, in which it is separated from the dust and fine dirt. From thence it passes through a spout into the separator or screen, in which it is freed from all shrunken grain and all the large foreign matter. Generally these two operations are performed by a combined machine as shown in fig. 1. After having passed through

in fig. 3, and the meal passes from one to another, being separated in its passage into the various qualities described. Very frequently the bran is ground over again, so that every particle of the flour of the grain is separated from the husk. Although the flour thus made is neither the whitest nor the finest it is nevertheless the most healthful, because it contains a larger portion of the phosphates of the grain, or that part of it which goes to make up the material for supplying the growth or the waste of the brain and the bone. An intricate arrangement of elevators and conveyers takes the various grades of flour separately into the packers seen in fig. 4. The elevators are square wooden pipes, through which a leather strap

Fig. 2.—STONE ROOM.

Fig. 4.—PACKING ROOM.

that this should be done within the mill. A large quantity of flour is inspected upon the wharves or in the warehouses. But the inspection brand is a satisfactory certificate as to quality, and purchasers may safely depend upon it as a guarantee. A large portion of flour enters into use in the arts or manufactures. Sour or unmerchantable flour is largely used as size or dressings for cotton warps or for bleached muslins. In the first case it is used to stiffen the threads to facilitate the process of weaving, and in the second case to fill up the interstices between the threads and to give it a body, so as to make thin, light goods, more attractive to purchasers. Bran is also used largely in the processes of dyeing and calico printing.

Butterfly-Weed—Pleurisy-Root.

There are few of our native plants more brilliant in flower than the *Asclepias tuberosa*, which is showy enough to have two common names, Butterfly-weed and Pleurisy-root. We do not know whether it received the first-mentioned name because it is "as beautiful as a butterfly" or for the reason that it is attractive to those insects; it was called Pleurisy-root from the fact that it has long been used in domestic medicine, and it has received some attention from physicians. It belongs to the genus *Asclepias*, or Milk-weeds, but, unlike the rest of them, it has no milky juice. The large, fleshy, and branching root throws up several stems one to two feet high, which, as well as the scattered or opposite leaves, are hairy. The stem usually branches above, each division bearing an umbel of brilliant orange flowers. The flowers of this genus of plants are difficult to describe in a popular manner; indeed, their structure is so intricate as only to be understood by those who are well versed in botany. Our object is, however, to call attention to the plant as an ornamental one. Here is a plant that is not rare "from Maine to Georgia" and further south, that is highly prized in Europe, and offered at a good price by the European florists, that is very rarely seen in cultivation. Its native localities are dry fields, and we have

BUTTERFLY-WEED—PLEURISY-ROOT.—(*Asclepias tuberosa*.)

and though not so brilliant as this one, are interesting plants and worthy of cultivation.

A Double Carolina Jessamine.

In April of last year we described and figured *Gelsemium sempervirens*, the Carolina or Yellow Jessamine, that is so conspicuous during the spring months all through the Southern States. This winter we have flowered in the greenhouse a double variety of this charming plant. We give an engraving which shows that it is quite like the other, only double. As the history of this plant is interesting, as showing how near a variety may come to being lost, we give it. Last spring, our friend P. J. Berckmans, of Fruitland Nurseries, Augusta, Ga., sent us a specimen, one of several that he had received from a lady in Louisiana, which was planted out in a bed with several other southern plants. When Mr. Berckmans was at our place last fall he asked about the Double Jessamine, and as it could not be found we supposed that, like many other things in the bed, it had been killed by the early drouth. Upon taking up our plants for the winter we found that it had been hidden by some quick-growing thing, but was in good condition. We wrote Mr. B. that the missing plant had been found, and he at once replied that he was rejoiced to hear it, as his plants had failed, and that the lady who sent it had died, so that he could get no more from the original source, and that we had, so far as known, the only plant in cultivation. The moral of this bit of experience is that those who have rare plants of any kind can best save them by sending a specimen to us.

The Fragrant Olive.

There are persons who expect to find every admirable quality in one plant. Such are not satisfied with the Camellia because it is not fragrant, and they would not be pleased with the Fragrant Olive, which, though fragrant enough, is not showy. But to those who are content with a plant as nature made it we can commend the Fragrant Olive. It is a native of China and Japan, where it forms a large shrub or small tree; it is an evergreen, with thick, ovate, pointed leaves, which are irregularly serrate on the margin; it bears clusters of very small yellowish white flowers, as shown in the engraving. The fragrance of the flowers is something remarkable; it is pervading without being powerful, and is not oppressive like some odors. We know of no other odor with which it fairly can be compared, as it stands alone in its refined excellence. The Chinese are said to mix the flowers with the choicer kinds of tea for the purpose of flavoring them. The plant succeeds well in the Southern States. Mr. P. J. Berckmans, at Augusta, Ga., has a particularly fine specimen growing near his house, which is eight feet or more high. We have a couple of small plants in the greenhouse, neither of which is over a foot high, which have been covered with flowers for weeks. We have not tried, it as a window plant, but from its behavior else-

FRAGRANT OLIVE.

where do not doubt it would answer admirably. We call the plant Fragrant Olive, as that is the translation of one of its botanical names, *Olea fragrans*. Some botanists put it in another

DOUBLE CAROLINA JESSAMINE.

seen it at the South remaining as a weed in cultivated grounds. It does well in ordinary garden soil. We have a clump which throws up an annually increasing number of flowering

genus, *Osmanthus*, which means odorous flower, but as the fruit is not known either in cultivation or in its native countries, its botanical position can not be fixed with certainty. Those who object to botanical names may take it under the Chinese, *Hoa-monc-tay*.

Packing Living Plants.

We often receive letters asking for directions about packing living plants to send by mail or express. These letters of course come from persons who are not florists or nurserymen, but we have received plants packed so poorly, from those who ought to know better, that we will give a few directions, which may be useful to both the professional and amateur florist. The best material to use in packing is what is known as "Sphagnum," a kind of moss common in bogs and wet places; other kinds of moss will answer, but as they do not absorb and retain moisture so readily are not so good. The amount of moisture necessary to preserve plants during their transit will vary with the season, and also the length of time it will take for the package to reach its destination. For plants which will be on the road from ten days to two weeks during the summer months, the moss should be only very slightly dampened; press the moss firmly in the hands before using, this will remove the excess of moisture, and still leave it damp enough. When plants are sent by express, procure a box of a size sufficient to contain them, and have it properly nailed so that it will not be broken during the journey. Then remove a portion of the soil from the roots, wrap the moss around them to a thickness of half an inch, and tie it firmly on with twine. After all the plants have been thus prepared, place a layer of dry moss or straw on the bottom of the box two inches thick; then place the larger plants, such as shrubs and trees, on this moss, crowding them firmly down, so that there will be no danger of shaking out of place; to prevent any movement braces are often placed across the inside and fastened with nails driven through the side of the box; this last plan is mostly used when plants are sent in pots. Finish off the top of the box with the smaller plants, and cover the whole with a layer of dry moss, which will press so firmly upon the plants, when the cover is fastened, as to prevent any shaking. If the box is deep there should be one or more layers of moss or straw used, as there is danger of heating when too many are packed together. Cactuses and most succulent or thick-leaved plants require packing in dry moss, for otherwise they rot. Water plants, such as the various pond lilies and pitcher-plants, need a greater amount of moisture than ordinary shrubby and herbaceous plants.

SENDING PLANTS BY MAIL.—The law passed some years since by Congress, allowing packages of plants to be sent by mail, if not over four pounds in weight, was a capital arrangement for those who lived at a distance from railroad and express offices, but it is so hampered with the various constructions given by the P. O. Department, that it is difficult to know what is required by the officials. The law now is, we believe, as follows: A package weighing four pounds or less, can be sent at the rate of two cents per four ounces, but the writing of the words "roots" or "plants" makes a letter of it, and is charged letter postage. Nothing should be written except the address, and the

package must not be sealed, or contain any writing, and it must be so fastened that the postmaster can examine the contents if he wishes. The plants may, however, be numbered, and their names sent by letter.

Many contrivances have been made for packing, but none are better than sphagnum and oiled paper when they can be had. Lay down a piece of oiled paper of the proper size, spread a thin layer of dry moss upon this; remove all the earth from the roots of the plants by washing, lay them upon the moss, and roll the whole tightly; then inclose in a strong wrapping paper without sealing. Plants sent in this way will remain in good condition for two weeks at least. Where oiled paper can not be had, the next best thing is a cigar-box, as it is light, and may be had almost anywhere. The moss must be dampened as for sending by express, as evaporation will be more rapid than in oiled paper. When plants are sent either by mail or express, a portion of the leaves should be cut off, and they arrive in better condition when a large part of the top is removed in the case of all trees and shrubs, with the exception of evergreens. Herbaceous plants, or those the leaves and stems of which die down every fall, should be cut back to within two inches of the roots. Use strong twine in tying the boxes, and do not wrap in paper. Bulbs not in a growing state must be packed in quite dry moss or chaff of any sort. When plants are sent out during cold weather or in the fall or early spring, the moss ought to be drier than that used during the summer. Those sent to us from California and the far West need rather more moisture, as they are on the road so long. It should be borne in mind that more plants are ruined by being packed too wet than too dry.

Notes from the Pines.

NOVELTIES IN VEGETABLES.

[We have usually this month given a list of the well-established and new vegetables as a guide to the inexperienced in gardening. Now the varieties that we consider the best of each kind will be enumerated under "Kitchen Garden" on page 83; and we will allow our correspondent from "The Pines" to have his say about the novelties offered this spring.—Ed.]

THE CATALOGUES HAVE COME!—At least most of them have, and I have had a grand time over them. If there is one thing I do thoroughly enjoy more than another it is a seedsman's catalogue, except it be a florist's or nurseryman's. A fairy story book is no more a delight to a boy than a catalogue to a true lover of plants. I have a friend who is so fascinated with a new catalogue that he will read it in bed, much to the annoyance of his wife, who, as every right-minded person will admit, has abundant grounds for a divorce. I pity the seedsman. If they do not have on hand every novelty offered in Europe, they lack enterprise, and if they have all these novelties and they, as nine-tenths more or less of them are sure to do, fail, the seedsman has all the blame. Every one is not expected to try every new thing—much less depend upon untried kinds for his main crop. If you were to offer to our shrewd Jersey market gardeners new seeds free of cost, they would not give up their particular pea and cabbage which they can count on almost to a day, and their celery which never failed to bring them handsome

returns. But I tell you what they would do: they would "take a few to try," and that is the whole story. Stick by well-proved sorts and test the new things as they come out. Fearing Burr, than whom there is no better authority on vegetables, once said to me, "If we add but one new variety of value to our list each year, we are making great progress." Unless a new variety is in some particular better than the best we now have, it will not have much chance of being permanently adopted. Next to supplying an abundance of fresh vegetables of the best kinds, my garden is valuable as a place to test novelties. Nothing in gardening gives greater pleasure than watching the growth and development of a new thing grown for the first time. I do not advise people not to purchase novelties, but to regard them as things on trial. Put in the regular crop of the standard sorts, and as many novelties as can be properly cared for or the purse can afford. Be prepared for disappointments; do not expect that a variety will grow the same in our hot summers as it does in England, or that a variety that originated in New Jersey will be adapted to Canada.

POTATOES stand on the border line between the field and garden. Early potatoes are properly considered as belonging to the list of garden varieties, and trial specimens of late kinds will usually find a place in the garden. Some of the English horticultural journals had so persistently written down our potatoes as a class, I had supposed that our varieties were as little adapted to English soil and climate as are their varieties to ours. Since several of our kinds that were in a trial of over 300 at the Horticultural Society's Gardens at Chiswick [see Jan. last, p. 19] received a first-class certificate upon their merits only, they having been grown under numbers, we are forced to believe that much of the former depreciation of our potatoes was due to prejudice. Among these varieties was one that had not been offered in this country, "Brownell's Beauty." The "Snowflake" is another new variety sent out by Messrs. Bliss. Virginia's reputation as "the mother of presidents" bids fair to be eclipsed by that of Vermont as "the mother of potatoes," and we have in the "Snowflake" another from the state which produced the "Early Rose." This is said to be a cross with the "Excelsior" upon an unnamed variety produced between the "White Peachblow" and "Early Rose." For accounts of its growth and productiveness we must depend on its originator, Mr. C. G. Pringle, Charlotte, Vt. As to its quality upon the table, I can speak from experience; it is hardly fair to decide on the quality of a vegetable or fruit without having tested it by the side of some standard varieties. Having tried this by itself I can only say that it seemed to me as good as any I ever tried—and my experience has not been small. [Engravings of these two varieties will be found on another page.—Ed.]

PEAS.—I wish there was an act of Congress preventing the importation of another new pea, or rather another pea with a new name, for the next ten years. The great majority of new peas come from England, which is a country eminently suited to the pea, while ours is not. They have pea connoisseurs there, and we have none. Our people want good peas, and plenty of them, and do not care if a variety has one more pea in a pod than another, or six more pods to the haulm, or is fifteen or twenty minutes earlier. It is very probable that so far as our climate is concerned we have reached as near perfection as possible with the pea, until

our own growers give us a variety which will give us a dozen pickings instead of two, and will not go in a fit of mildew with the first hot days. The catalogue descriptions must be a great puzzle to the novice; we read in one of "McLean's Little Gem," emphasized by italics, that it is "*The very best early dwarf wrinkled pea grown.*" And directly below is "McLean's Blue Peter," of which we read: "A decided improvement upon 'Little Gem,' and that is saying a great deal." Better than the best should be good enough for any one. I have not a word to say against "Blue Peter," for I have found it a tip-top variety, but wish only to show the perplexities that beset the novice. Fortunately there are but few new ones this year, among which are: "McLean's Best of All" (until he gets one better), "Nelson's Vanguard" and "Suttou's Jersey Hero," each of which, as a matter of course, embodies all the good qualities belonging to any pea; at least so say the English descriptions. In the way of

TOMATOES I have seen but few new ones in the catalogues. "Belle de Denville," from France, and "Extra Dwarf Red," both by Briggs Bro., and "Alliance" by Vick, are all that I have thus far come across. As a matter of duty I shall have to try these, though I place but little reliance upon one person's experience in one year. From my last year's trial only I should be warranted in writing down "Canada Victor," "Hathaway's Excelsior," and others as failures, but I know that they are not, for the "Excelsior" has given satisfaction both at home and abroad, and a grower who lives about three miles in a straight line from me, thinks that the "Canada Victor" is the finest tomato grown. He sold a number of single specimens for seed at a dollar each—while I would not have given that sum for my whole crop of a dozen plants. Why the difference? He has a stiff rocky soil, on a high hill, while I live in a valley, on a light soil, without a stone handy to throw at a strange cat. Then again my friend has no end of glass, while I being cramped for sash room, did not get my plants forward early, and when I did set them out, it was on the edge of a dry spell which continued so long as to make them forget all about growing. The "Trophy," which I have grown since it first came out, has each year been perfect, while the neighbor referred to says he can not thoroughly ripen it. Our standard varieties are so good that it will be difficult for any new comers to excel them: the same may be said of

LETTUCE, to which our climate is not very favorable. I stick up my stake at the Hanson, introduced a year or two ago by our lamented Dreer. Unless a new variety can surpass that, it is of no use. "Satisfaction" (Vick), "Green, Fat Cabbage" (Bliss), and "Kingsholm Cots" (Dreer) are the principal new sorts. Get the seed in the hot-bed early this month, and put out the plants, first properly hardened, as soon as the soil can be worked.

LEEK.—There may be a difference in leeks, but so far as I have seen it is mostly in the labels on the seed bag. A new one called "Extra Large Carentan" claims to be bigger, better, and all that, than any other.

SQUASH.—It seems a great piece of presumption for a new squash to come from anywhere except Marblehead. This time it is French, and called "Round-warted Marrow," described as of medium size, fine quality, a good keeper, and more than all, it is "warted all over."

CUCUMBERS.—We have the Russian Netted

and Swan Neck from Briggs Bro. and Henderson & Co. Several new frame sorts are offered.

MELONS.—The only new ones I have noticed are Prescott (Dreer) and Green Climbing (Briggs Bro), which last is said to be cultivated on trellises and poles, and a "most excellent novelty."

BEANS.—Gregory offers the "Marblehead Champion," which is a pole bean and of remarkable earliness. He says "as early or earlier than the earliest bush varieties." Gregory "knows beans." Crosman Bros., Rochester, have the "White Advancer," for which earliness and great productiveness are claimed.

These are about all the important novelties, and it is to be distinctly understood that whatever is said of them is on the authority of the catalogues. Later, I hope to speak from personal knowledge.

A New Trick of the Robin.

It is well known that most wild creatures have a strong preference for particular kinds of food, and will seldom try experiments with new sorts so long as they can find the food they are accustomed to. Trout which feed upon flies will hardly look at anything else while the season lasts. Rabbits that have been accustomed to sweet apples around their favorite haunts will follow that bait into almost any trap laid for them. Robins while rearing their young in the nests live almost exclusively upon grubs and worms, the old birds devouring with disgusting greediness what the nestlings imperfectly digest. While the cherries last, their favorite haunt is the cherry-tree, and nothing but shot can dislodge them. When the currants begin to redden they perch upon the neighboring fence, and little else than currants can be found in their crops. In some places they are accused of eating peas in the pod, and by the sea-shore discarded fish-nets are thrown over the pea-brush to keep off the intruders. All kinds of small fruit suffer in their turn, and if left to follow their own instincts, the fruits in small gardens will generally be cleaned out by the robins. For the first time the past season we noticed the robins pecking away at the Flemish Beauty pears. This was the only kind assailed in a fruit yard of a dozen or more varieties. They usually commenced operations upon the blushing cheek, just as it began to ripen. Have these birds an esthetic nature, and do they admire beauty of color? They followed the pears as they dropped upon the ground, and rivaled the chickens in scooping out the luscious pulp with their beaks. Did they learn this trick of the chickens, and are they susceptible of education? Have they a nicer taste than the chickens to discern the better flavor of the Flemish Beauty and to leave Buffums and Bartletts untouched?

Raising Tomato Plants.

BY J. B. ROOT, ROCKFORD, ILL.]

There are few crops in which the gardener so much desires to secure earliness as the tomato. But poor success does he have with the sickly, slender plants so generally offered for sale, which recover so slowly from transplanting as to fruit but little earlier than plants raised in the open ground. Consequently they meet with little demand. But offer on the same stands stocky, tree-like plants, well hardened and already in bud, which can beset in the garden without a day's hinderance of growth, and nearly every owner of a garden who sees

buys of them, though the price be ten times that of the frailer sort. Such plants are best secured by the following treatment:

Late in February we make our first sowing, and repeat it every week or ten days to keep up a succession and to provide against accidents. For this purpose use light boxes filled nearly full of compost which can be easily lifted in and out. The cheapest are second-hand boxes from grocery stores, which can be split after the cover is nailed on and made into two. At this season of the year the bed must be a deep one, with abundance of heat, and the plants will then put in an early appearance, and should remain in the same boxes until they touch each other between the rows if the rows are an inch apart. They are then transplanted into other boxes an inch apart each way. Cases in which oysters in the can have been shipped, split into two, are cheap and very convenient, and thirteen usually fit neatly into a frame 12 x 5½. Here they are allowed to remain until they again touch and crowd.

For their next receptacle we provide quart oyster cans cut into two. This makes of each can two neat, stout tin boxes three inches deep, two wide, and three long, and these are convenient for so many uses in plant growing that it may be worth while to describe how they are easiest cut and fitted for use. To hold them while being cut, make and screw to the work-bench a stout frame or box just large enough to hold a can on its broadside, together with a wedge to tighten it. Saw-cuts directly opposite each other should be made in the box. Placing a short stiff-backed saw in these cuts, a few quick strokes answer to cut the can in two. Of course, the saw dulls quickly, but cuts well even if dull, and can be quickly touched up with a file and kept sharp enough. Fitting each half-can over a piece of hard wood of the right size, two or three quick strokes serve to make holes an inch square in the bottoms if they have not already been made. The jagged edges are then hammered smooth, and a pine chip covering the entire bottom, and yet not fitting tightly, is put in. This serves a double purpose: it secures drainage, without which a plant will not flourish, and also serves as a means to remove the plant undisturbed from the can when wanted.

Into these half cans filled with rich compost the plants are then removed with as much dirt as can be easily lifted with them. If the cans are then allowed to stand a few minutes in an inch of water, and the bed for a day or two is protected with lath screens, the plant scarcely stops growth, and soon fills the can with a perfect mass of roots.

When ready for sale they are placed for a couple of days several inches apart on boards in some place where the air circulates freely, and are thus hardened.

In these cans, if occasionally watered, they receive no injury if exposed for sale on the stands for days together. Carried into the garden they can be set out undisturbed, and without injury to the can, by giving a steady pressure against the chip from below, by which the plant, roots, and soil altogether are taken out undisturbed. One hardly realizes how nicely this is done until he has tried it.

To accommodate parties buying largely, and wishing to get them cheaper, and also for use in my own market garden, they are transplanted into boxes holding from one to six dozen each when given the same space as in cans. To secure extra fine plants for early market purposes the plants are given another transplanting

into boxes two inches apart before putting into cans; and a couple of days before each transplanting a knife is drawn between the rows of plants each way in the boxes, which serves as root pruning and induces a new growth of a mass of roots, and also induces early fruiting. It also gives the plants a wonderful start, if after setting out in the garden the soil about the plant is thoroughly drenched with manure

A Climbing Fern.

Among the ferns there are a few with twining stems. We have one, a native of this country, which though not very common is pretty widely distributed, it growing from New England to Kentucky and Tennessee. This—the *Lygodium palmatum*—is much sought after for drying for ornamental purposes, and is inter-

months as a parlor plant, and it has thus far grown finely. Should it prove able to withstand the dry heat of our dwellings it will become a most popular window plant.

The Canada Burnet.

One of the noticeable plants of our Northern swamps and wet meadows is the Canada Bur-

CLIMBING FERN.—(*Lygodium volubile*.)

CANADA BURNET.—(*Poterium Canadense*.)

leachings so diluted as not to endanger the life of the plant.

I am confident that the use of these half cans for almost any purpose in place of pots will be found satisfactory. They do not break in handling, they waste no space in the bed, pack solidly in the oyster cases so as to ship any distance, and are good for years. Restaurants and hotels are usually glad enough to get rid of the cans, and two boys 15 years of age will fit for use 300 to 400 in a day. I have been offering for five years plants grown in this way, and the demand has grown so that they have almost entirely supplanted all others, and I commend them to my fellow gardeners with great confidence that they will please.

[It may be well to add, for the benefit of those who live where they can procure oysters directly from the shell, that the West is supplied with oysters put up in Maryland and Virginia in tin cans of various sizes. These cans are not round, like those for fruit and tomatoes, but have flat sides, being of the shape and not far from the size of a brick. Immense quantities of oysters thus packed are sold every winter in the Western towns and cities, and they usually arrive in excellent condition.—Ed.]

esting as being probably the only fern that was ever the subject of legislation, the Legislature of Connecticut having passed a law to prevent the wanton extermination of the fern in that State. This species was figured in the *Agriculturist* for January, 1870. There are several exotic species grown in greenhouses, some of which are exceedingly beautiful and more delicate than ours. One of these we not long ago received from Olm Brothers, Newark, N. J., who raised it from the spores which they received under the name of *Lygodium flexuosum*. As there is much confusion in collections in regard to these climbing ferns, the same thing being found under the name of *L. scandens*, *L. flexuosum*, and *L. volubile*, we can not be sure of the name of the present plant, but think the last given name properly belongs to it. But we are sure of its great beauty, which can not be adequately represented within the limited space of our engraving. Like our native one, the upper and fruit-bearing divisions of the fronds are more delicate than the lower. This fern will grow to the height of six feet or more, and is one of the most graceful greenhouse plants that can be imagined. One of our friends has had it on trial for some

net, *Poterium Canadense*. The stem is from three to six feet high, with rather coarse pinnate leaves, and terminated by a dense spike of white flowers sometimes a foot long. These flowers will be found upon examination to be without any petals, and that the showy part of the flower is the long white stamens. One would hardly at first sight suppose that this belonged to the Rose Family, but its structure places it there, not far from the Spirææ. Although not very showy, this plant might be introduced into the shrubbery, where its long spikes, appearing late in summer, would have a good effect rising above the then generally flowerless shrubs. The botanical name, *Poterium*, comes from the Greek for *drinking-cup*, the leaves of the European species having been used in medicinal drinks. The name Burnet we get in a roundabout way from the French *brunette*, the flowers of the European plant being brownish. In other countries the European Burnet is grown in gardens for its leaves, which have the odor of cucumbers and a spicy taste, and are used in salads and as a flavoring for soup. It is rarely used in this country, except by foreigners, who knew it abroad, but our seedsmen usually keep the seed for sale.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Wall Pockets and Holders.

Receptacles of various sizes placed against the wall are often of great convenience in bed-rooms, sitting-rooms, or other parts of the house. These may be made elaborately and costly or of cheap materials, which if well selected often produce as good an effect as the more expensive ones. They are made small enough to hold a watch and large enough to hold newspapers. Those of which we give illustrations are made of pasteboard and covered with inexpensive materials, and finished with ornaments that are easily obtained. Slippers which are only worn during the evening are much in the way the rest of the time unless there is a place for them, and as this place should always be close at hand nothing is more convenient than a

SLIPPER HOLDER to hang upon the wall. It is made of pasteboard, black cloth, ordinary white china buttons, and white beads; is made with very slight expense and trouble, and is more effective than many of the elaborately worked slipper holders. Make the pattern for the back, which it will be observed is a square with a rounded portion below; fold the paper in the middle, so as to cut both sides of the pattern alike. Commencing the curving just at the end of the square, make a cover for the pasteboard, cut after this pattern, of black (or colored) cloth on one side and strong muslin on the other. Make the pocket part of the same materials as shown in the engraving. Sew on the buttons with red silk. The center of the palm pat-

SLIPPER HOLDER.

tern is made by sewing on ordinary white beads, matching the buttons in color. A neat

WALL POCKET, to hold small articles is made thus: Take a square of pasteboard; cover with blue, red, or green muslin; fasten securely on the wrong side. It will be prettier if two sides are braided in some simple pattern. Trim these sides with crochet lace, so as to soften the effect of the edge. Next make a paper pattern for the pocket part by cutting a square larger than the one you have already covered. Take a ruler or any straight edge and draw a line from one corner to the other; cut close to this line. Measure this by placing corner to corner with the covered back, and you will find your half square a little too large at the top. Dot with a pencil how much on each side and draw a line parallel to the first, and cut neatly. Lay this paper pattern on thin pasteboard and cut as accurately as possible. Cover this half square with the same shade of paper muslin; fasten on wrong side securely. Make a cover, which may be taken off

and washed, of white dotted Swiss. Trim with ruffle of white. The edge is simply rolled over and coarsely over-handed with worsted the same shade as the paper muslin, and ribbon bows which orna-

WALL POCKET.

ment the top and sides. The illustrations and descriptions are sent by Miss A. Donlevy.

"Sweet Home."

Have you seen the ideal home? Let me try to describe it. It is the place where all ("all" may be only two individuals, or it may be more) unite to give security and freedom and help and sympathy to each; where each feels free to act out himself in any way that does not interfere with the welfare of any other; where each is sure of sympathy in his joys and sorrows and plans; where each feels bound, by bonds of affection which are only perfect freedom to the wise, to lend a helping hand to any other member of the home who is in need of any kind of help that he can give; where the golden rule is the law of daily action because the law of love is written on all hearts.

No, I have never seen the ideal home as I have described it here, except in brief glimpses, and yet I do know something of it. I doubt whether any one lives, in the present somewhat chaotic state of human nature, who has constantly such a home, at least in its outward aspects. There may be—yes, I believe that there are—such homes carried about in the hearts of some fortunate ones who truly love each other, and love the Highest and Best supremely. There are those who know internally all about "sweet home," know it by a kind of revelation from above, who have lives of outward hardship and sorrow, perhaps have not even a place to lay their heads.

How near to this ideal standard of safety and freedom and joy can we bring our actual homes? That is a question for all home-makers to study. Women are home-makers, but so are men. It can not be a true home where the service is one-sided, where only one tries to bear "one another's burdens." Each must do and bear a part, though the stronger and wiser ones can do and bear the most.

Do they? No; in many a place called "home," but never truly such, they who are strong use their strength to compel the service of the weaker ones; they who imagine themselves superior in wisdom prove their folly by exacting signs of reverence from those they consider their inferiors because of age or sex or some kind of personal difference, while they allow their own rudeness, and selfishness such license among the defenseless members of their own family as they would not venture upon anywhere else.

The perfect home, in outward aspects, is hardly possible yet, because we are still so imperfectly christianized. We are all linked together, good and evil, wise and foolish, healthy and sick. They

who grovel keep those down who try to rise. They who try to raise themselves find that they are burdened by the weight of all mankind below them, and that the truest way to help themselves is to set to work to help everybody else. The spirit of caste and the true home spirit never harmonize. You sing the praises of home and the family, and then look about for the reality of that which your fancy pictures. You find that the bare struggle for an existence—for food and clothes and shelter—consumes all of the time and strength of a large proportion of our fellow-men; that the little children scarcely get a chance to see their fathers; that the fathers and mothers are so weary and care-worn when evening comes that any interchange of thought except upon the cares and anxieties of their position and the foolish neighborhood gossip seems impossible. Then there are homes where wealth abounds, but you see the inmates worried by the cares that wealth entails and by the incompetency and unfaithfulness of those they employ to do their work. Ignorant servants—"servants" of any kind in the usual sense of that word—mar the harmony of home. Private family selfishness is the lasting bane of our present style of home. How soon

shall we be able to bring Bridget and all her class within the influence of the co-operative spirit? How soon shall we be able to unite our home interests sufficiently to allow us all some chance to draw a free breath? When we shall have made moral and spiritual progress enough for this a good many evils which seem each to call for a special class of "reformers" will settle themselves, so to speak.

FALL.

What Shall we Have for Breakfast?

BY MRS. ELLEN E. BONDAM, OXFORD, O.

Last month we gave an answer to this question from a lady in Louisiana, and we now give another, this time from Ohio, with recipes for preparing such dishes as the writer considers not generally known or for which her manner of making them may be peculiar. She writes:

"In preparing a bill of fare for breakfast for one week I have selected such articles as most farmers' wives can command, and such as I am in the habit of setting before my own family. Most of the dishes are wholesome and easily prepared, and a breakfast from any one of these bills of fare can be made ready in forty-five minutes."

Bill of fare for breakfast for one week:

SUNDAY.—Beefsteak. Hashed potato. Fried mush. Baked apples. Cold bread, coffee, and such fruit as is in season accompany each breakfast, and need not be repeated.

MONDAY.—Broiled ham. Potato balls. Graham gems.

TUESDAY.—Sausage or mutton chops. Fried potatoes. Corn dodgers.

WEDNESDAY.—Breakfast bacon or corned-beef hash. Baked potatoes. Shirred eggs. Corn bread. Pickles.

THURSDAY.—Veal cutlets. Boiled potatoes. Butter-cakes or milk toast.

FRIDAY.—Ham toast, and Graham bread. Potatoes pared, sliced, and boiled in just water enough to cover them. Pickles.

SATURDAY.—Codfish balls. Boiled eggs. Fried rice or baking-powder biscuit.

HASHED POTATOES.—Chop cold boiled potatoes as for hash. Moisten with milk, add butter and salt to taste, and heat in a skillet.

GRAHAM GEMS.—One heaping pint of Graham flour, one scant pint of cold water, and one-half tea-spoonful of salt. Heat the gem-pans, grease, and fill even full with the batter. They will bake in thirty minutes in a quick oven.

CORN DODGERS.—Scald the corn-meal, add salt and cold water, having the batter as stiff as mush.

Bake in gem-pans. If milk is used instead of water they will brown more quickly, but are no better.

SHIRRED EGGS.—Heat a little butter in a pie-pan, then put in the eggs, taking care that the yolks are not broken, and bake in the oven.

CORN BREAD.—One pint of buttermilk; one heaping pint of meal; one even tea-spoonful of soda; two eggs.

HAM TOAST.—Chop cold boiled ham; add milk to soften a sufficient quantity of toast; add butter, and season to taste. After dipping the toast, and just before dishing, stir in two or more eggs. As soon as it begins to thicken pour over the toast.

GRAHAM BREAD.—Two tea-cupfuls of buttermilk; two tea-cupfuls of sweet milk; one-half a tea-cup of molasses; one tea-spoonful of soda; salt; and Graham flour to make a stiff batter. Bake in gem-pans.

FRIED RICE.—Take cold boiled rice, stir in an egg, and drop by the spoonful on a hot griddle.

Concerning Medical Matters.

A lady in Illinois writes that she sent us several months ago some recipes that she had found exceedingly useful in her family, and wonders that we have not published them. In respect to medical matters we have some very positive opinions—one of which is that there is far too much medicine taken for the good of the people, and that, so far as we are concerned, we shall do nothing towards inducing our readers to dose themselves. Physicians are far in advance of the people in this respect; they do not give one-tenth part of the drugs they did twenty-five years ago, and were it not that their patients would not be satisfied if they did not "do something," they would give still less than they do now. A sick person needs to have his mind treated as well as his body, and if he feels that something is being done for him his mind is at ease, and he will not fret about himself. So a physician really does him a benefit by leaving some harmless thing, to be taken in exact doses every few hours—the oftener the better, as it will occupy the mind in looking out for the precise time. Every physician knows that while the patient's view of his services is confined to the medicine given, his trouble is to find out exactly what is the matter, and how far nature is tending to repair damages. If matters are going on well enough, and if not interfered with, nature will effect a cure; all he has to do is to amuse the patient with harmless doses. If he were to say, "there is nothing serious the matter with you; you have only to keep in bed and feed on slops, and you will be well in a week," that doctor would be discharged, and one sent for who would "understand the case and give something to cure it." The mental effect of the visits of a cheery doctor is of great help to patients who are not especially ill, and his services in this respect are worth all they cost. Now, we do not mean to say that there are no cases that need medicine, for there are many in which life may depend upon the most prompt and energetic treatment; but what we wish most especially to enforce, is the fact that when there is any serious illness no one who has not been educated to the matter can make a proper *diagnosis*, which is the medical term for finding out what is the matter, and is the most difficult thing to do; if this be not correct the treatment may be useless, or even harmful. It would be folly for us to publish remedies for particular maladies when it is almost impossible for other than a physician to know whether such diseases are present or not. We do not wish to convey the idea that a physician should be called for every minor ailment; colds, irregularities of the stomach and bowels, local pains, and other such ills can be treated with the domestic remedies at hand. Every family keeps a few simple remedies, which vary according to usage; but there should always be at hand, especially in farm-houses—something to make a warm drink to promote perspiration, some cathartic or laxative to move the bowels, some astringent, and

anodyne, and in fever and ague districts quinine or such other antiperiodic as is known to be useful. For the rest the kitchen may be depended upon for soda as an antacid, salt to check vomiting, cayenne pepper as a stimulant, and mustard, one of the most useful of applications for local pains. When an illness does not yield, and promptly, to these domestic remedies do not hesitate about calling a doctor. The pain in the stomach or bowels that does not yield to a mustard plaster and a few doses of paregoric or laudanum may be a symptom of some serious disease of those parts that requires an entirely different treatment. A sore throat with a pain not relieved at once by the usual remedies may indicate the severe and often fatal diphtheria, and a continued and increasing looseness of the bowels may be a symptom of something more serious than an ordinary diarrhoea. Every sensible mother will, the moment that she is not sure she is right, call in the services of some one who knows more than she does. Delay may be dangerous. We think that those papers who under the head of a "Hygienic Department" publish all sorts of remedies and recipes do more harm than good. Hygiene has very little to do with dosing. We may here perhaps properly answer questions which have been proposed probably a hundred times in one form or another—that is, if in our denunciations of all secret remedies, patent or proprietary medicines, we would not exempt this or that particular one which the writer has tried and found useful. No; we do not except one. A large portion of these are frauds, being mere stimulants of the cheapest sort. Others are medicinal, but there is not one of them from beginning to end that is composed of any other than well-known drugs. No; we object to all these things put up in bottles and labelled, for the reasons that you do not know what you are taking, and that you are paying an enormous price for some cheap drug—fifty cents or a dollar for what could be bought for five or ten cents, simply because it is put up in a bottle with a showy label, and called somebody's "balsam," "panacea," or what not. The hundreds of babies that have come to their untimely deaths from the use of "soothing syrups," which the mothers did not know contained deadly quantities of morphine, should be a sufficient warning against secret compounds. Our friends who have sent us recipes for what they consider "the best thing in the world" for this or that disease, must excuse us if we do not publish them. It is a little curious that most persons recommend any remedy as "the best thing in the world," while their knowledge of the world is exceedingly limited.

Minor Hints and Notes.

A CAREFUL LAUNDRESS can always be known by one sign. It is not the smoothness or polish of the bosoms and collars, but by a minor matter. Does she iron out strings? There is nothing more annoying than to have a tape used as a string to drawers or elsewhere rolled and twisted into a cord. All good ironers make them flat and as good as new.

CANDIED HONEY.—The candying of honey is due to a part of the sugar becoming crystallized. The honey is just as good and as pure as ever, but not quite so pleasant to eat on account of the small grains of sugar. There is no way known to prevent this, and the best honey, that made from clover early in the season, is more apt to be candied at the present time than the later made. By placing the bottle or jar containing the honey in a vessel of water, with sticks under it to keep it from direct contact with the bottom of the vessel, and gradually heating it, the sugar will be dissolved and the honey become clear, and last in that condition a greater or less time, according to the temperature at which it is kept. If it should become candied again the heating may be repeated.

ARE PLANTS IN ROOMS UNHEALTHFUL?—We have answered No a number of times, but the question still comes, probably from new subscribers. The atmosphere of a greenhouse crowded with plants has been analyzed, and found to be not

essentially different from ordinary air. If it were unhealthy to breathe the air in which plants were growing we who live in the country should show it, and those who during summer camp out in the woods would hardly find the health they seek. There is no danger in sleeping in a room with plants. A whole roomful can not affect the air nearly as much as an additional person or the burning of a night-lamp. The fact that certain odors of flowers are unpleasant to persons particularly sensitive to such things is another matter. It is usually a case of individual peculiarity, and easily remedied by removing the offending plant.

BLACKING IRON-WORK.—"S. M. T." If the iron-work is not to be exposed to heat you can have nothing better than shellac varnish and lamp-black. We have before given directions for making the varnish, which are in brief: In a wide-mouthed bottle put shellac with sufficient strong alcohol to cover it. Put this in a warm place, or in a vessel of water with something to keep the bottle from touching the bottom of the vessel, and heat the water gradually; the shellac will soon dissolve. If the varnish is too thick add more alcohol. For black, put some lamp-black in a cup, wet it thoroughly with alcohol, and add some of the varnish and mix. This is to be used on the iron-work as paint. Put on another coat if needed. This black varnish dries bright on metals, but on wood or other surfaces the first coat will sink in and be dull, and the application must be repeated. If wanted very smooth polish with a flannel and a very little sweet oil. Other colors that are not very delicate can be used in the dry state with the varnish, which is a handy thing in the house.

IN KEROSENE LAMPS the light often is unsatisfactory while all is apparently in good order. It should be borne in mind that, though the wick is but very gradually burned, it is constantly becoming less able to conduct the oil. During several weeks some quarts of oil are slowly filtered through the wick, which stops every particle of dust or other matter that will with the utmost care be in the best kinds of oil. The result is that the wick, though it is of sufficient length and looks as good as ever, has its conducting power greatly impaired, as its pores, so to speak, or the minute channels by which the oil reaches the place to be burned, become gradually obstructed. It is often economy to substitute a new wick for an old one, even if that be plenty long enough to serve for some time to come.

A Netherland Breakfast.—R. Van Oosterhout, Scott Co., Minn., writes: "I contend that the most wholesome breakfast is made of Java coffee, filtered, with cream and sugar added to the taste. A slice of white and Graham bread each, lightly buttered with good sweet butter, and a little grated or sliced cheese between. The dose repeated if needed. It is the national breakfast of the Netherlanders."

JOHNNY-CAKE WITH EGGS.—Two cups of sweet milk; half a tea-spoonful of salt; one table-spoonful of sugar; two eggs well beaten; a small tea-cup of white flour mixed with a tea-spoonful of baking-powder, and corn-meal enough to make a batter. Sometimes I begin with the meal and scald it, and then use only one cup of sweet milk and no baking-powder, with no definite proportion of white flour—enough to make the batter right. The batter should always be thicker when the meal is scalded than when it is not, because in the latter case you must allow for the meal to swell some. Of course, the milk should be added to cool the scalded meal before the eggs are put in, or the hot mush would partially cook the eggs.

PARADISE CAKE.—Three eggs; one cup of butter; two and a half cups of sugar; one and a half cup of sweet milk; a small teaspoonful of soda; four large cups of flour; one pound of raisins; cloves, cinnamon, and nutmeg.

BOYS & GIRLS' COLUMNS.

The Doctor takes the Boys to a Match Factory.

"Uncle," said one of the boys, as the match with which the evening lamp was lighted went off with a snap and a fizz, "how are matches made?" "That depends upon the country," I replied. "In some Indian countries the young man ties a horse near the hut of the

something that will take fire readily and burn long enough to set fire to it. For the cheaper matches sulphur is used, but for what are called parlor matches they use paraffine, which burns without any unpleasant odor. "What is paraffine?"—"It is one of the many things obtained from petroleum; it is a solid white body that looks much like white wax; it burns with a very brilliant light, and is used for making candles." At the time of our visit they were making sulphur-dipped matches, but the operation is the same with paraffine. The material is melted in a large vessel, and the roll of

more difficulty than they should. After it is well mixed, the sticks that have had their ends covered with sulphur or paraffine are dipped in it in the same manner as at the first dipping, only care is required to have but a small quantity of the mixture just at the very tips. The next step is to dry the matches, and they are taken to a room where they are placed upon racks; here there is a fan rapidly revolving, so as to constantly change the air and gradually dry the composition upon the ends of the matches. They are not allowed to become so dry that they will readily take

Fig. 1.—MAKING THE STICKS INTO ROLLS.

Fig. 2.—DIPPING IN SULPHUR.

fire, as they have still to go through another machine, and if they were perfectly dry, disagreeable accidents might happen. Thus far the matches are in pairs, or "double headers"—twice the length of one—and they have to be cut apart. For this they are put into a cutting machine (fig. 5), which unrolls the bundle and carries the sticks over a knife which rapidly cuts them in equal parts, and the now complete matches slide into boxes on each side of the machine. All that remains to be done is to pack them in the proper boxes.

The boys left the factory feeling that their curiosity about the making of one kind of matches, at least, was satisfied. I asked Art what part of the operation interested him most. He said, "The machines that made the match sticks up into rolls and cut the sticks apart. Why, they did their work just as if they could think." "I know why," said Wat; "the man who invented them put lots of think into them."—"A very good idea, Master Walter," I suggested, "but it would be much more proper to say, 'they embodied a great deal of thought.'"—I am not sure, but I heard him remark in an undertone, "He has forgotten his boys' talk."

maiden, and if she feeds and waters it, the owner is accepted; but if the horse is left without care for three days, he is— Then there was a shout. "What a provoking old uncle! You know we don't mean that kind of matches, but the kind with which we strike a light." I promised to take them to the city next Saturday, where there are several match factories, the proprietor of one of which I knew. At the proper time, Wat, Art (as we abbreviate Walter and Arthur), and myself found our way to the place where matches are made. "What I want most to see," said Wat, "is the way in which all those nice round sticks are whittled out. I should not think a man could make sticks for many boxes of matches in a day, if he had ever so good a knife." The proprietor smiled as he informed the boy that the sticks were not made by whittling, nor were they made at the factory. The sticks are brought from Canada, where the making of them is a separate business. They are made by machinery which drives a block of wood upon a steel die that has numerous small holes in it. The wood is forced through these holes in the rounded form of the match sticks. They are twice the length of an ordinary match, and come packed in boxes. The first thing to be done with the sticks is to arrange them so that large numbers can be handled at once in dipping the ends in the mixtures that cause them to light readily. If the sticks were simply tied together in bundles, they would be too close together, and the composition would be all in one mass upon their ends, so a machine had to be invented which should make them into rolls and still keep the sticks a little distance apart. This machine (fig. 1) did its work with wonderful rapidity and accuracy; the sticks were applied to the machine which made them into

sticks so suspended (fig. 2) that the ends can be evenly and slightly dipped in the melted sulphur. Both ends are dipped, and they are then ready to receive the composition that takes fire when the match is rubbed. The principal thing in this composition is phosphorus, which the boys saw, looking like sticks of barley candy in a bottle of water. Finding it had to be kept under water to prevent it from taking fire, and that it was a very curious substance in other respects, I had to promise to tell them more about phosphorus and sulphur when we got home, as we could not now take up the time of the proprietor of the match factory. Although pure phosphorus takes fire so readily, it may be so mixed with other things as to require to be strongly rubbed before it will burn. It melts readily, and may be mixed while in the melted state with these things, if care be taken to keep it covered from the air. We learned that different makers of matches use different mixtures for

say, 'they embodied a great deal of thought.'"—I am not sure, but I heard him remark in an undertone, "He has forgotten his boys' talk."

large rolls, and with a belt of cloth between the layers of sticks; this cloth keeps the sticks just a little distance apart. When the bundle is large enough, some two feet across, it is bound securely and then taken to another room. "What a smell!" exclaimed both the boys at once, as we entered the room. "It is not very pleasant to strangers," said the proprietor, "but we who are here every day do not notice it." We learned that the composition upon the ends of matches does not burn long enough to set fire to the stick, and that before that is applied it is necessary to prepare the wood with

their composition, but all of them have phosphorus as the principal thing. Some have chlorate of potash in them, a substance that in some respects is a good deal like saltpeter. The phosphorus is mixed with dissolved glue, and whiting or some other powder to make a paste, and coloring stuff is added. The whole, after being stirred over a fire (fig. 3), is put into a machine where it is more thoroughly mixed. It is very important that the composition be well mixed, as otherwise some matches will get more, and some less phosphorus than they ought to have, and will go off too easily, or with

Performing Bears.

Bears, great clumsy fellows as they are, have no little intelligence, and they are capable of being taught various tricks. Among the street shows of large cities it is not rare to see bears who have been trained to go through various performances. The engraving represents a scene which one of our artists saw in the street some time ago. Among other things that the animals had been taught to do, one had the accomplishment of standing on his head, while the other would uncork a demijohn and take a drink from it, much to the amusement of the bystanders. We never see bears thus treated but we wish they might get away to the wilds where they belong. To be muzzled and led about from place to place and made to perform what are no doubt very unpleasant antics, and probably to be beaten, is indeed a great change from the free life to which they were born. There used to be a bear at one of the public gardens near New York which was quite a good customer to the proprietor's bar. The bear was exceedingly fond of soda water, and visitors would buy bottles of it to give to the bear for the sake of seeing how handily he

named a boat which he fitted up with a very rude engine. Those who have been to New York city have no doubt seen the great stone prison called "The Tombs." Where this stands there was in the early days of the city a large pond called the Collect, from which a small stream ran through what is now Canal street to the Hudson River. It was upon the borders of this pond that Fitch fitted out his boat, and it was on its surface that moved, so far as is known, the first vessel propelled by steam. The boat is described as a very rickety affair, which would move off for a few minutes and then it would stop until more steam could be made. The engraving made from an old model shows how the boat looked. It does not seem to have attracted a great share of attention, and finally the boat went to decay and was carried off in pieces by poor people to burn. It is said that Fulton was present while Fitch was making his experiments, and if this were the case he no doubt profited by his failures. Fulton has the credit of having first propelled a vessel by steam, as he was the first who put the idea to practical use; the same as Morse by his inventions made the telegraph practical. Telegraphs had been experimented with in a small way before Morse made his, but they were of no real value until Morse took the matter in

THE FIRST STEAMBOAT.

hand, and to him justly belongs the credit. An important invention is rarely the work of one person alone; many fail, but we hear only of the successful one.

Carrying a Ladder.—Did you ever see a person

carry a ladder? He puts it on his shoulder, or it may be puts his head between the rounds and has one of the sides resting on each shoulder, and having it nicely balanced walks along. A man with a ladder is an interesting object in a crowded street. He looks at the end before him, but the end behind him he can not see. If he moves the front to the right end to get out of the way of a person, away goes the rear end just as far in the opposite direction, and the slightest turn of his body, only a few inches, will give the ends a sweep of several feet, and those in the way may look out for bruised hats and bumped heads, while the window glass along the street is in constant danger from the unseen rear end of the ladder. When a small boy, I was carrying a not very large ladder, when there was a crash. An unlucky movement had brought the rear end of my ladder against a window. Instead of scolding me, my father made me stop, and said very quietly: "Look here, my son, there is one thing I wish you to always remember; that is, every ladder has two ends." I never have forgotten that, though many, many years have gone, and I never see a man carrying a ladder or other long thing but what I remember the two ends. Don't we carry things besides ladders that have two ends? When I see a young man getting "fast" habits I think he sees only one end of that ladder, the one pointed towards pleasure, and that he does not know that the other end is wounding his parents' hearts. Many a young girl carries a ladder in the shape of a love for dress and finery; she only sees the gratification of a foolish pride at the forward end of that ladder, while the end that she does not see is crushing true modesty and pure friendship as she goes along thoughtlessly among the crowd. Ah! yes, every ladder has two ends, and it is a thing to be remembered in more ways than one.

The First Steamboat.

Who built the first steamboat? All the smart scholars will probably answer at once "Robert Fulton." And the smart scholars would all be wrong, for the first steamboat was built in 1796, while Fulton did not build his until 1807. One John Fitch built in the year first

It was not a very well-read farmer who told the sewing machine agent, who solicited him to purchase, that he did not want any of "them air machines," as his wheat came up well enough when sowed by hand.

Life Insurance.

NONE is less respected than the man who muddles away his income nobody knows how. For all expenditure there should be something to show, and that something ought to have either usefulness or dignity or permanence to recommend it.

But every now and then we meet with cases of expenditure actually mysterious. A man of princely inheritance or preferment does nothing with it, makes no figure, helps nobody, maintains no expensive state, yet not only spends every dollar of his income, but is in continual embarrassment and difficulty. His estate crumbles away, his house grows dilapidated, his equipments shabby, his creditors clamorous, and at last he dies, leaving his sons penniless and his daughters homeless. Instead of performing his part in sustaining the great fabric of society as far as his influence and opportunity enable him to do so, there is one vast dilapidation.

Nobody can say exactly where the fault is or where the money is gone. It has not benefited friends, assisted dependents, built school-houses, tilled the soil, developed the country, beautified the town, or done anything that can be set down to his credit. It has all been dribbled and frittered away on hollow pretenses and petty occasions and trivial objects, without either system or purpose. It has won neither gratitude nor admiration nor respect. The only useful thing the man does is to fertilize the earth by rotting in it.

How mean does such a life appear! How unworthy of the name of life! And yet how many human lives are lived to no better purpose, and leave behind them no more creditable results!

The sin of this aimless, empty prodigality lies at other doors as well as those of the rich. Moderate and even scanty incomes can be made to contribute something permanent to the fortunes of their recipients. But it is the men of small means and moderate incomes who are most sadly at fault in respect to that useless expenditure of which we are speaking. It is not extravagance, because such can not be extravagant. It is a slippery habit of expenditure, which justifies itself with the unspoken apology: "I can never save anything. My effort to do so would be contemptible and vain. Why then attempt it?"

But there is no man of howsoever moderate income, or howsoever small means, who can not at least leave his family the better for his having lived. The savings of a little economy, the small self-denials that can be made every day, and in the making of which manhood grows to a tougher fiber and a statelier height—these will suffice to leave to the mother and her little ones a legacy that will lift them above want and the fear of want.

Life insurance is the only means known whereby this can be surely done; and in this light life insurance is seen to be a duty that no true man can excuse himself in neglecting. It is frequently and warmly commended, but it can not be commended too often nor with too much warmth. It is the moral duty of every man to bequeath to his children more money than he began life with himself. Life insurance alone enables him to do this beyond peradventure.

Many are the companies appealing to the public for patronage. Most of them are good; and among the very best is the United States Life Insurance Company of this city. It is secure; it is liberal; it is progressive; it is honorable. Nearly a quarter of a century has tested it, and each year has borne increasing witness to its stability and its worth.

Consumers Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D. C.

Seed Time Cometh!

The twenty-first editions of our illustrated FLOWER and KITCHEN GARDEN DIRECTORIES for 1874, with a Supplement of Novelties and Selections, embracing a list of Seed grown by the best Boston Market Gardeners and also by the most famous European growers of flowers and vegetables, including many that can rarely be found elsewhere, will be forwarded about the first of February to all customers free of charge, and to other applicants inclosing a three-cent stamp.

- D. T. CURTIS & CO.,** 161 Tremont St., Boston, Mass.
 Successors to CURTIS & COBB.
SEED FOR EARLY FORCING.
 TOMATO, *New Early Dwarf*, fine for small gardens— $\frac{3}{4}$ pkt. 25c.
 TOMATO, *Canada Victor*, a superior productive early var.— $\frac{3}{4}$ pkt. 25c.
 TOMATO, *The Arlington*, bright red, solid, and fine form—per pkt. 25c.
 Boston Market Tennis Ball Lettuce— $\frac{3}{4}$ oz. 75c.; 15c. $\frac{3}{4}$ pkt.
 White Spined Cucumber, improved—50c.; 15c.
 Long Frame Cucumbers, High'd Mary and Hallstone, each 25c. per pkt.

THE BEST TOMATO

Early, Solid, Enormously Productive, and of excellent flavor. Is a cross between the *Early Smooth Red* and *Feejee*. Fruit of perfect form, smooth, bright red color, very solid, having small seed cells, and no hard core at the center, being of the same delicate texture and brilliant color throughout. Ripens with the earliest. Fruit often weighing 24 to 26 ounces. Stands the drouth better than any other variety.

By the Potomac Fruit-Growers' Society it was pronounced of superior excellence in size, form, color, solidity, evenness of ripening, and flavor.

L. J. Tuttle, Assistant Treasurer, United States, says: I find the "Arlington" has in a remarkable degree all the requisites of a perfect Tomato. I know nothing that equals it.

The President's Gardener says: The Arlington Tomato, tested under my supervision in the President's gardens, was superior to any other kind.

D. W. Harrington, Washington, D. C., says: I tested it on my farm the past season side by side with the "Trophy," "General Grant," and "Feejee," and while my other plants were older and larger when set, the "Arlington" ripened fully ten days before any of the others, and has the further peculiarity that the same vines bear an abundance of fruit until the frost kills them, while all other kinds with me have required an extra set of plants for late fruit. Its solidity and flavor alone are enough to mark its superiority over anything I have ever seen.

Many letters, from persons who have tested it the past season, speak in the strongest terms of its superiority over all others.

Seed saved from selected fruit, 25 cts. per packet; 5 packets for \$1. Address

GARDENERS declare my Garden Manual valuable as a \$3 work. Small but full of labor-saving methods and valuable ideas learned in many years' extensive market gardening. Sent for two stamps.
J. B. ROOT, Seed Grower, ROCKFORD, ILL.

My business is to supply, what every farmer of experience is most anxious to get, perfectly reliable Vegetable and Flower Seed. With this object in view, besides importing many varieties from reliable growers in France, England, and Germany, I grow a hundred and fifty kinds of vegetable seed on my four seed farms, right under my own eye. Around all of these I throw the protection of the three warrants of my Catalogue. Of new vegetables I make a specialty, having been the first to introduce the Hubbard and Marblehead Squashes, the Marblehead Cabbages, and a score of others. My Catalogue, containing numerous fine engravings, taken from photographs, sent free to all.

THE HERALD OF HEALTH FOR 1874.

THREE EXTRA NUMBERS FREE TO NEW SUBSCRIBERS.

The January number contains a remarkable article by GEORGE DARWIN, son of the great naturalist, entitled

Sanitary Restrictions to Marriage.

Every unmarried person, male or female, should read it.

The February number contains:

Enlightened Motherhood.

By MRS. CORBIN.

SEX IN EDUCATION.

By MRS. HORACE MANN.

The March Number, among other things, contains:

HEALING THE SICK BY PRAYER.

By REV. JOHN KELLY, of London.

THE WASTES OF LIFE.

By REV. W. S. CLARK.

Prevention and Treatment of Consumption.

(This is the first of a series of six valuable papers.)

Receipt for Graham Bread.

To Prevent Constipation.

CAUSE OF DEBILITY.

Catarrh—Its Treatment.

SCROFULOUS CHILDREN.

To Get Free From Aches and Pains.

Each number contains valuable papers on the home treatment of diseases, as Sick Headache, Dyspepsia, Teaching Children Concerning Sexual Matters, the Physical Education of Delicate Children, Diseases of Women, and everything that pertains to better health, physical and mental, for men, women, and children. It should be in every family where there is an invalid or any sickness. It will teach how to avoid all, and rear families

in Health, Strength, and Beauty.

\$2.00 a Year. Samples 15 Cents.

HENRY A. DREER,
714 Chestnut St., Philadelphia, Pa.

A Household Necessity,

And just as represented, is the new *Triumph Sweet Corn*, which is the result of ten years' careful cultivation, and a peculiar selection of Seed. It is large, early, and very productive. That it surpasses all other varieties is clearly proven by the high testimonials received from prominent Market Gardeners, Seedsmen, and Agriculturists. I own and control all the seed stock of this variety, and it can be had only from the originator.

Free by mail at 25 cts. a package, or 5 pkts. \$1.00. Selected ears \$1.00 each. Address
DAVID C. VOORHEES, Blavenburg, N. J.

I will give a Premium of \$25.00 for the best six stalks having the largest and most perfectly ripened ears (kept pure from hybridization with any other corn) raised from the seed of *Triumph Sweet Corn* bought of me. Sent to me free before November 1st, 1874.

ADVERTISERS should send to **Geo. P. Rowell & Co.,** 41 Park Row, N. Y., for their *Eighty-page Pamphlet*, containing lists of 3,000 newspapers and estimates, showing the cost of advertising. Mailed free to all applicants.

AGENTS LOOK!—\$12 a day made selling A Scissors Sharpener and other wares. Sample 25 cts. Catalogue free. **T. J. HASTINGS & CO.,** Worcester, Mass.

ON THE BLUE, BETWEEN CAMDEN AND CRETE,—CRETE AT THE LEFT, IN THE DISTANCE.
REPRESENTATIVE VIEW OF LANDS FOR SALE BY THE BURLINGTON AND MISSOURI RIVER RAILROAD COMPANY.

**IF YOU WANT A FARM OR HOME,
YOU SHOULD BUY OF THE
BURLINGTON AND MISSOURI RIVER RAILROAD CO.**

- BECAUSE**—Their prices are low, ranging for the best land from Three to Ten Dollars per acre.
- BECAUSE**—No payments are required of the purchaser for four years, except interest at six per cent.
- BECAUSE**—After the expiration of four years, SEVEN YEARS are allowed for payment of the principal.
- BECAUSE**—You are not obliged to go into a wilderness, but into a well-settled State, the population of which is rapidly increasing.
- BECAUSE**—The mildness of the climate and fertility of the soil is such that the settler can pay for his farm from the products raised upon it long before the time when the principal becomes due.
- BECAUSE**—Failure of crops from drought is unknown.
- BECAUSE**—Large allowances are made upon fare and freight, thus giving low rates on both to purchasers of this Company's lands.

AND YOU SHOULD BUY THIS YEAR.

BECAUSE—Purchasers during 1874 who cultivate one-half their land within two years from their purchase are allowed a reduction of twenty per cent on the price of their land.
LARGE DISCOUNTS also, FOR CASH, within One, Two, or Three Years.

New Scheme of Easy Payments

FOR

MASON & HAMLIN

CABINET ORGANS.

The MASON & HAMLIN ORGAN COMPANY have arranged a new system, under which they now offer their well-known Organs For Rent, with Privilege of Purchase, at prices and on terms extraordinarily favorable.

Payments may run through one to four years. All Rent which has been paid allowed and deducted on Organs purchased and paid for within one year.

An Organ may be returned after six months at cost of only reasonable rent, if for any reason it is not wanted longer. If an Organ be retained, and rent paid four years, it becomes the property of the party hiring, without further payment.

Organs will be rented on this plan to any part of the country accessible to our warehouses or agencies. Only knowledge of the unrivaled excellence of our Organs, and practical experience that they will be found so attractive in use that scarcely any of them will ever be returned, warrant this offer to supply them on such terms.

Terms of Renting, containing full particulars, with descriptions of Styles, Rents, and Prices; also, Illustrated Catalogues and Testimonial Circulars, sent Free. Address

MASON & HAMLIN ORGAN CO., BOSTON, NEW YORK, OR CHICAGO.

IMPORTANT TO INVENTORS.

American Agriculturist PATENT DEPARTMENT

In compliance with the request of numerous inventors, we have organized a

PATENT DEPARTMENT

in connection with this office for the transaction of all business connected with

Securing Patents

in the United States and foreign countries.

The character for

Reliability

which has been maintained by the AMERICAN AGRICULTURIST for more than thirty years will be carefully guarded in this as in other departments.

All Inventors

desirous of procuring patents at moderate cost are invited to forward (express prepaid) a model of their invention, with a brief description of its working. The model should not exceed one cubic foot in dimension. Upon receipt of model an opinion as to patentability will be given free of charge.

Preliminary Examination

at the Patent Office, to determine patentability, will be promptly made for a fee of \$5.

Litigation of Patents.

The services of the best counsel have been secured to prosecute or protect before the U. S. Courts and the Patent Office the claims of those intrusting their business to this agency.

Specifications, drawings, engravings, models, and all other appliances furnished at moderate prices.

In all dealings with this Department inventors may depend upon promptness, fidelity to their interests, and the best services which can be rendered by thorough experts. For full particulars, address

AMERICAN AGRICULTURIST PATENT DEPARTMENT, ORANGE JUDD COMPANY, 245 Broadway, New York.

PAINT!

Standard Architectural Books for Carpenters and Builders.

Monckton's National Builder and Stair-Builder.—A new and original work, covering every practical branch of Constructive Carpentry, with 1,000 Working Scale Drawings, in two colors. Showing the simplest methods of finding all Joints and Forms; method of constructing all varieties of French Roof; all other methods of Roofing, all styles of Framing; Splayed Work, Ceilings, Domes, Niches, Raking and Level Moldings, etc., with a Treatise on Stair-Building and Hand-Railing, and Designs for Stair-Cases, Newels, Balusters, and Hand-Rails. One royal quarto volume, uniform with "Woodward's National Architect." Post-paid, \$12.00.

The above work is also divided and published in two volumes as follows:

Monckton's National Stair-Builder.—Is a complete work on Stair-Building and Hand-Railing. Fully explained and illustrated by large scale diagrams, in two colors, with designs for Staircases, Newels, Balusters, and Hand-Rails. Royal Quarto. Post-paid, \$6.00.

Monckton's National Carpenter and Joiner.—A complete work, covering the whole science of Carpentry, Joinery, Roofing, Framing, etc., fully explained and illustrated by large scale diagrams in two colors. Royal Quarto. Postpaid, \$6.00.

Woodward's National Architect.—1,000 Designs, Plans, and Details for Country, Suburban, and Village Houses; with Perspective Views, Front and Side Elevations, Sections, Full Detail Drawings, Specifications, and Estimates. Also, Detail Drawings to Working Scale, of Brackets, Cornices, French Roofs, Sectional and Framing Plans of French Roofs, Dormer-Windows for French Roofs, Bay-Windows, Verandas, Porches, Plaster Finish, Cornices, Ceilings, Hard-wood Mantels, and all that is required by a Builder to design, specify, erect, and finish in the most approved style. One superb quarto volume. Post-paid, \$12.00.

Woodward's Cottages and Farm Houses.—188 Designs and Plans of low-priced Cottages, Farm Houses, and Out-Buildings. Post-paid, \$1.50.

Woodward's Suburban and Country Houses.—70 Designs and Plans, and numerous examples of the French Roof. Post-paid, \$1.50.

Woodward's Country Homes.—150 Designs and Plans, with Description of the Manner of Constructing Balloon Frames. Post-paid, \$1.50.

Woodward's Graperies and Horticultural Buildings.—Designs and Plans of Hot-Beds, Cold-Pits, Propagating Houses, Forcing Houses, Hot and Cold Graperies, Green Houses, Conservatories, Orchard Houses, etc., with the various modes of Ventilating and Heating. Post-paid, \$1.50.

Wheeler's Rural Homes.—Houses suited to Country Life. Post-paid, \$2.00.

Wheeler's Homes for the People.—100 Original Designs, with full Descriptions, and Constructive and Miscellaneous Details. Post-paid, \$3.00.

Harney's Barns, Out-Buildings, and Fences.—Containing Designs and Plans of Stables, Farm Barns, Out-Buildings, Gates, Gateways, Fences, Stable Fittings and Furniture, with nearly 200 Illustrations. Royal quarto. Post-paid, \$10.00.

Eveleth's School-house Architecture.—A new and original work, containing Seventeen Designs for School-houses, Sixty-seven Plates with Perspectives, Elevations, Plans, Sections, Details, Specifications all drawn to working scale, with methods of Heating and Ventilation. Large quarto. Post-paid, \$10.00.

Copley's Plain and Ornamental Alphabets.—Giving examples in all styles, together with Maps, Titles, Borders, Meridians, Ciphers, Monograms, Flourishes, etc., adapted for the practical use of Surveyors, Civil Engineers, Draughtsmen, Architects, Sign Painters, Schools, etc. Post-paid, \$3.00.

Beckwith Sewing Machines

ONLY \$12.

ONLY \$20.

We have offered as a Premium, and also for sale, for more than a year past, the

Beckwith Sewing Machine,

which has been fully described in previous numbers of this paper. We have already given and sold more than one thousand of these machines, and testimonials of satisfaction have come from every quarter.

We still offer the **Beckwith Sewing Machine, Improved**, price \$12. A new and very simple braiding-foot has been made, by which a child can sew on braid without the least trouble, following any desired pattern with ease; also a new arm, spiral spring and lever for raising the presser-foot, all of which are now set in a position that leaves the needle free to be threaded. The joint is much enlarged, and the machine is otherwise greatly strengthened and improved. The use of the braider-foot alone will be valued more than the cost of the machine.

Each of these machines is put in a neat, compact box, with *hemmer and guide, oil-can with oil, thread, different-sized needles, etc.*, with full Printed Directions for using. On receipt of \$12 we will send one of these machines to any address, expressage to be paid by the purchaser.

The Machine as a Premium.

We will give one of these \$12 machines to any one who will collect and forward eight subscribers for *Hearth and Home* one year at \$3 each; or sixteen subscribers to *American Agriculturist* for one year, at \$1.50 each, expressage on the machine to be paid by the recipient of it.

THE BECKWITH

PORTABLE

Family Sewing Machine.

PRICE \$20.

Enlarged and Improved.

ITS WEIGHT IS 7 POUNDS.

While we continue the offer of the Improved \$12 Machine as heretofore, we now offer the new

Portable Family Machine,

price \$20, which comprises all the excellencies of the former, with many valuable improvements. Its size and power are increased, and its capacity thus very much enlarged, without impairing its portability. There have been added cam and eccentric movement, a balance-wheel, and also an oscillating needle-clamp, by which the length of stitch can with the greatest ease be changed to the finest shade of variation without touching the needle.

To any one sending us \$20, we will send one of the Machines (packed in a neat, portable case, with handle to carry it easily), expressage to be paid by purchaser.

The Machine as a Premium.

We will give one of these \$20 Machines to any one who will collect and forward to us Fifteen Subscribers to *Hearth and Home* for one year at \$3 each, or Thirty Subscribers to *American Agriculturist* for one year at \$1.50 each, or One Hundred at \$1 each, expressage on the Machine to be paid by the recipient of it.

Almost any lady can readily secure the small number of subscribers required to get either the \$12 or the \$20 Machine as described above; or some friend can thus obtain it for her as a present.

DO GOOD AND MAKE MONEY.

The Publishers of American Agriculturist and HEARTH AND HOME take pleasure in presenting in the adjoining Table, their new general Premium List for 1874. The Premiums which they have offered in past years have engaged the attention of a very large number of persons of all ages and both sexes.

Here is pleasant and profitable work for all. Any one who wishes to do good and make money, can do both by going to work as here invited by the publishers of these two most valuable journals, American Agriculturist and HEARTH AND HOME. You need only to show specimens of the papers, promise the beautiful Chromos, which are now ready for delivery, according to the publishers' offer, and forward your subscriptions. TRY IT.

Explanatory Notes.

N. B.

Read and carefully

Note the following items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But... (b) Tell us with each name or list of names sent, that it is for a premium... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have any time, from now until July 1st, to fill up your list... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers... (f) Specimen Numbers, etc., will be supplied free as needed by canvassers, but they should be used carefully and economically, and where they will tell... (g) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd Company, or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk; otherwise it is not.

[In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 a year for American Agriculturist, and \$3.00 a year for Hearth and Home; also at the club rates of \$1 and \$2.50; also at the rates of \$4 a year for both papers together.] Description of Premiums sent free to applicants.

N. B.—It all Premium Clubs for either paper, TWO copies of American Agriculturist (English or German) at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the 2d and 4th columns, or from the 3d and 5th, or wholly from the 6th column.

Table of Premiums and Terms for American Agriculturist, and for Hearth and Home, for the Year 1874. Open to all—No Competition. Columns include No., Names of Premium Articles, Price of Premiums, and Number of Subscribers required at various rates.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 2 to 8, 27 to 33, 55 to 78, and 81 to 93, inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express office nearest the recipient) to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance desired. Description of Premiums sent free to applicants.

PLANTS.

Our Plants, for health and vigor, can not be surpassed. The impression conveyed by the many complimentary letters we have received the past year is, that our Plants are superior in size and quality to those generally received from Nurseries. We have only space for a few of those letters in our Catalogue.

Our collection of Plants will be found rich in popular varieties, such as Roses, Geraniums, Fuchsias, and many other favorites.

SEEDS.

**Garden Seeds,
Field Seeds,
Flower Seeds.**

Of the best and most popular kinds, and of undoubted quality, having been selected from the most reliable growers in the world, and fully tested by us. We call particular attention to our **One, Two, Three, and Five Dollar Collections of SEEDS**, as set forth in our Catalogue.

ROSES.

Our collection of Roses embraces the best kinds of **Hybrid Perpetual, Moss, Bourbon, China,** and **Ever-blooming Tea-Scented Varieties.** They are all grown in pots, and ready for immediate flowering. Can be sent by mail with perfect safety. We will send six choice sorts, safely packed, by mail on receipt of \$1.00, or twelve choice sorts, including one Moss Rose, on receipt of \$2.00. If the selection is left to us we will send such as will give constant flower the whole season.

Geraniums.

Our collection of Geraniums is unrivaled, and includes the splendid varieties, **Master Christine, Jean Sisley,** and the beautiful Double Pink Variety, **Marie Lemoine.**

We send twelve beautiful varieties by mail for \$2.00, each twelve to include a plant of either one of the above varieties the parties ordering may select. We also send six sorts by mail for \$1.00. We offer the new Double White Geranium, **Aline Sisley,** at \$1.00 each. We also offer five other **Beautiful New Double Varieties,** some of them of quite new and remarkable colors—for full description of which, with many other new plants, see our Catalogue. We also make some splendid special offers in Geraniums, which we are enabled to do from our immense stock.

In our Catalogue will also be found a fine collection of new and older

Fuchsias,
Carnations, Verbenas, Dahlias,
Chrysanthemums, Phloxes,

Pelargonium—Master Christine.

Six beautiful new varieties of COLEUS, with a full assortment of Greenhouse and Bedding Plants. Sent everywhere by mail or express.

OUR NEW CHROMO,

ENTITLED

"Look Out!"

A Beautiful, New Picture

FOR EVERY SUBSCRIBER

TO

Hearth and Home

FOR 1874.

Another fine Oil Painting has been executed by Mr. Reinhart for the Publishers of HEARTH AND HOME. It has also been reproduced with great success in Chromo. This Picture, which is entitled "LOOK OUT!" is finely colored, and the same in size as the Chromo "Up for Repairs," which has been executed for subscribers to the *American Agriculturist*. It is designed as a Present for ALL Subscribers to HEARTH AND HOME for the year 1874, received after this date, including single subscribers, those in Clubs, etc.

It will be delivered at 245 Broadway free of charge. If to be sent by mail, 10 cents must be furnished to prepay packing and postage. **For 25 cents it will be Mounted, Varnished, Packed, and sent Prepaid to subscribers to HEARTH AND HOME for 1874.**

N. B.—The Chromo will be delivered:

At the office, **Unmounted**,.....Free.
 " " **Mounted**,.....15 cts. extra.
 If sent postpaid, **Unmounted**,...10 cts. extra.
 " " **Mounted**,.....25 cts. extra.

"THE STRAWBERRY GIRL."

A few of the beautiful pictures, "The Strawberry Girl," which have been given to thousands of subscribers, are still in stock, and, while any remain, subscribers to HEARTH AND HOME can have their choice between this and the new Chromo, "Look Out!"; but the choice must be named at time of subscribing, and if the first is taken, **50 cts. extra**, instead of 25 cts., must be sent for mounting, packing, and prepayment.

The price of HEARTH AND HOME is \$3 a year, or \$4 secures HEARTH AND HOME and *American Agriculturist*.

\$3.25 will pay for HEARTH AND HOME and New Chromo mounted, and Chromo will be packed and sent, prepaid, to the subscriber. (\$3.50 if Chromo "Strawberry Girl" is taken instead of "Look Out!")

\$1.75 will pay for *American Agriculturist* and Chromo, mounted, and Chromo will be packed and sent, prepaid, to the subscriber.

\$4.50 will pay for *American Agriculturist* and HEARTH AND HOME together, with both Chromos, mounted, and Chromos will be sent, prepaid, to subscriber. (\$4.75 if Chromo "Strawberry Girl" is taken.)

ORANGE JUDD COMPANY, Publishers,
 245 BROADWAY, NEW YORK.

OUR NEW CHROMO,

ENTITLED

"Up for Repairs,"

A Beautiful, New Picture

FOR EVERY SUBSCRIBER

TO THE

American Agriculturist

FOR 1874.

The great satisfaction which has been expressed by tens of thousands of subscribers to this paper who have received the picture entitled "Mischief Brewing," has led the Publishers to provide another beautiful Gift for their patrons for the coming year.

An exquisite Oil Painting by the celebrated American Painter, Mr. B. F. Reinhart, executed expressly for the *American Agriculturist* and entitled

"UP FOR REPAIRS,"

has been most successfully reproduced in Chromo by the well-known firm of Bencke & Scott. It is a picture of a scene in childhood, which many will recognize as what they have themselves witnessed or been actors in, and can not fail to please both old and young. The Chromo is so perfectly done as scarcely to be distinguished from the original.

The Publishers will give this beautiful Chromo

To Every Subscriber

to this paper for the year 1874 received after this date, as detailed below. It is ready for immediate delivery at 245 Broadway, Free of Charge.

If to go by mail, 10 cents must be sent to cover cost of packing and postage. **For 25 cents it will be Mounted, Varnished, Packed, and sent Post-paid.**

N. B.—The Chromo will be delivered:

At the Office, **Unmounted**, Free.
 " " **Mounted**, 15 cents extra.
 Sent by Mail, **Unmounted**, 10 cents extra.
 " " **Mounted**, 25 cents extra.

We advise all to have them mounted before leaving the office, as in the large quantities we put up we are able to mount them for a quarter of the cost of doing it singly, and better than it can usually be done elsewhere.

The picture is designed for every subscriber upon the terms stated above, which please read carefully; and on these terms all are alike entitled to it, whether their names come singly at \$1.50 each, or in Clubs of Four for \$5, or Clubs of Ten at \$1.20 each, or in Clubs of Twenty or more at \$1 each. Subscribers in Premium Clubs will also thus be entitled to it.

N. B.—A few of the beautiful pictures entitled "MISCHIEF BREWING," which have been given to so large a number of subscribers, are still in stock, and, while any remain, subscribers to the *American Agriculturist* can have their choice between this and the new Chromo "UP FOR REPAIRS;" but the choice must be named at time of subscribing.

Play and Profit IN MY GARDEN.

By E. P. ROE,

Author of "Barriers Burned Away," etc.

NOTICES BY THE PRESS.

The author takes us to his garden on the rocky hill-sides in the vicinity of West Point and shows us how out of it, after four years' experience, he evoked a profit of \$1,000, and this while carrying on pastoral and literary labors. . . . It is very rare that so much literary taste and skill are mated to so much agricultural experience and practical good sense.—*Harper's Magazine*.

His little garden he confesses is nothing to boast of, not one of the miraculously fertile spots which, if you tickle with a plow, they laugh into a harvest, but still he managed to make it produce the value of \$2,000 in a single summer, and it might have been more but for sundry mishaps and mistakes which he found out when it was too late.—*New York Tribune*.

CONTENTS.

CHAP. 1.—Will you Walk into my Garden?	CHAP. 10.—When to Commence a Garden.
2.—My Garden Accounted for.	11.—We will go to Work.
3.—My Garden—Its Location.	12.—The Campaign in September.
4.—My Garden—How it Grew.	13.—Preparing for Winter Quarters.
5.—My Garden—What Fruits were Cultivated.	14.—Gardening Over a Winter Fire.
6.—The Same—Continued.	15.—April.
7.—Markets.	16.—Grafting or Horticultural Conversion.
8.—Expenses.	17.—Corn and Beans (Success).
9.—Ground for a Garden.

GET THE BEST.

Gardening for Profit.

A Guide to the Successful Cultivation of the Market and Family Garden.

By **PETER HENDERSON.**

Finely Illustrated. Price, Post-paid, \$1.50.

The success of this book has probably not been equaled by that of any horticultural work of the present day. Its popularity is due to the fact that it tells just what people wish to know—the way in which the author made money by gardening—and puts in a plain, striking light all the requisites to success. The writer was not afraid to have people know that he cultivated his land for profit, and, more than that, he was quite willing that all should know and practice, if they chose, the very processes which he had found most conducive to the desired end. The late Horace Greeley said of this book: "There are marvels of transformation and rapid reproduction recorded therein which might well shame the dull fancy of the author of Aladdin or Kaloolah. There is no theory about it; a man who has made himself rich by market-gardening plainly tells our young men how they can get rich as easily as he did, and without wandering to California or Montana for it either." And tens of thousands who have read and profited by the work could give similar testimony. It is unquestionably the most thorough and the best book of its kind that has yet come from the hand of an American author.

The following is a specimen of hundreds of letters that have been received concerning this work.

I was an early purchaser of "Gardening for Profit," a reading of which made the possession of "Practical Floriculture" a necessity. I sincerely thank the writer for giv-

ing us non-professionals what we have so long needed—some plain common-sense directions for our assistance—and for having exploded some outrageous humbugs which have been perpetuated in all previous works on gardening and floriculture from time immemorial, tending to produce the conviction that nothing but professional skill could raise a vegetable or flower. **LUTHER NEWCOMB,**
May 4, 1873. Montpeller, Vt.

Money IN THE GARDEN.

A VEGETABLE MANUAL,

PREPARED WITH A VIEW TO

ECONOMY AND PROFIT,

BY **P. T. QUINN,**

PRACTICAL HORTICULTURIST.

In this work the author aims to give, in a plain, practical style, instructions on three distinct although closely connected branches of gardening—the kitchen-garden, market-garden, and field culture; the only and sufficient credentials for the fitness of his undertaking being a successful practical experience for a term of years.

CONTENTS.

HAVE A LAND GRANT OF

12,000,000 ACRES!

OF THE BEST MINERAL AND FARMING LANDS OF AMERICA.

4,250,000 ACRES IN THE STATE OF NEBRASKA.

3,000,000 ACRES in Central and Eastern Nebraska,

IN THE GREAT PLATTE VALLEY,
THE GARDEN OF THE WEST,

NOW FOR SALE AT PRICES THAT DEFY COMPETITION.

Cheap Lands—The Best Investment.

No fluctuations! Always Improving in Value! The Wealth of the Country is made by the Advance in Real Estate! These lands are located on the 41st Degree of North Latitude, in the

Great Central Belt of Population, Commerce, and Wealth.

Have a mild and healthy climate, and for Grain and Fruit Growing and Stock Raising are unsurpassed by any in the United States.

The Best Market in the West,

The great Mining Regions of Wyoming, Colorado, Utah, and Nevada being supplied by the farmers of the PLATTE VALLEY.

Cheaper in Price and More Favorable Terms Given than can be Found Elsewhere.

Five and Ten Years' Credit Given, with Interest at Six per Cent.

NO ADVANCE INTEREST REQUIRED. Colonists and Actual Settlers can buy on Ten Years' Credit. Lands at same price to all Credit purchasers. Prices range from \$2.00 to \$10.00 per Acre. A Deduction of Ten per Cent for Cash. The Land Grant Bonds of the Company are taken at par in payment for the Lands.

Free Homesteads for Actual Settlers. The Best Locations for Colonies.

SOLDIERS OF THE LATE WAR are entitled to a **FREE HOMESTEAD OF 160 ACRES** within Railroad Limits, which is equal to a **DIRECT BOUNTY of \$400. DO NOT DELAY. NOW IS THE TIME TO SECURE A HOME.** Free Passes to Purchasers of Railroad Lands. Buy Through Tickets Direct to Omaha, Nebraska.

Sectional Maps, showing Lands for sale, with the prices corrected up to the latest date, also Descriptive Pamphlet with new maps published in ENGLISH, GERMAN, SWEDISH, DANISH, FRENCH, DUTCH, and BOHEMIAN, furnished gratuitously on application to the Land Department, or mailed free to any address. "THE PIONEER" is also sent FREE to applicants IN ANY PART OF THE WORLD. Address

O. F. DAVIS, Land Commissioner U. P. R.R., OMAHA, NEB.

PEAR CULTURE

FOR PROFIT.

By **P. T. QUINN,**

PRACTICAL HORTICULTURIST.

ILLUSTRATED.

If one wishes to raise pears intelligently, and with the best results, he must know first the character of his soil, the best mode of preparing it, the best varieties to select under existing conditions, the best mode of planting, pruning, fertilizing, grafting, and utilizing the ground before the trees come into bearing, and finally, of gathering and packing for market.

The hope of furnishing practical information on all these points has induced the author to endeavor to draw for others the same lessons which years of practical experience have afforded him.

Contents:

- | | |
|-----------------------------------|-------------------------------|
| Chap. I. Varieties. | Chap. IX. Varieties to Plant. |
| " II. Aspect. | " X. Pruning. |
| " III. Preparation of the Soil. | " XI. Manuring and Mulching. |
| " IV. Distance Apart in Planting. | " XII. Gathering Fruit. |
| " V. Dwarfs and Standards. | " XIII. Marketing Pears. |
| " VI. Planting-Time. | " XIV. Profits. |
| " VII. Planting. | " XV. Propagation, etc. |
| " VIII. Nursery Trees. | " XVI. Practical Suggestions. |

AMERICAN

AGRICULTURIST

FOR THE FARM, GARDEN & HOUSEHOLD.

Vol. XXXIII

Number 4

PUBLISHED BY THE
ORANGE JUDD COMPANY,
245 BROADWAY,
NEW-YORK.

Standard Architectural Books for Carpenters and Builders.

Hussey's National Cottage Architecture; or, Homes for Every One.—With Designs, Plans, Details, Specifications, and Cost; with Working Scale, Drawings complete, so that Houses may be built direct from the book. Adapted to the popular demand for practical, handsome, and economical homes. Royal Quarto. Six Dollars, post-paid.

Atwood's Country and Suburban Houses.—Illustrated with about 150 engravings. Hints and Suggestions as to the General Principles of House-building, Style, Cost, Location, etc. Post-paid, \$1.50.

Monckton's National Stair-Builder.—Is a complete work on Stair-Building and Hand-Railing. Fully explained and illustrated by large scale diagrams, in two colors, with designs for Staircases, Newels, Balusters, and Hand-Rails. Royal Quarto. Post-paid, \$6.00.

Monckton's National Carpenter and Joiner.—A complete work, covering the whole science of Carpentry, Joinery, Roofing, Framing, etc., fully explained and illustrated by large scale diagrams in two colors. Royal Quarto. Post-paid, \$6.00.

Woodward's National Architect.—1,000 Designs, Plans, and Details for Country, Suburban, and Village Houses; with Perspective Views, Front and Side Elevations, Sections, Full Detail Drawings, Specifications, and Estimates. Also, Detail Drawings to Working Scale, of Brackets, Cornices, French Roofs, Sectional and Framing Plans of French Roofs, Dormer-Windows for French Roofs, Bay-Windows, Verandas, Porches, Plaster Finish, Cornices, Ceilings, Hard-wood Mantels, and all that is required by a Builder to design, specify, erect, and finish in the most approved style. One superb quarto volume. Post-paid, \$12.00.

ORANGE JUDD COMPANY, Publishers, 245 Broadway, New York.

Woodward's Cottages and Farm Houses.—188 Designs and Plans of low-priced Cottages, Farm Houses, and Out-Buildings. Post-paid, \$1.50.

Woodward's Suburban and Country Houses.—70 Designs and Plans, and numerous examples of the French Roof. Post-paid, \$1.50.

Woodward's Country Homes.—150 Designs and Plans, with Description of the Manner of Constructing Balloon Frames. Post-paid, \$1.50.

Woodward's Graperies and Horticultural Buildings.—Designs and Plans of Hot-Beds, Cold-Pits, Propagating Houses, Forcing Houses, Hot and Cold Graperies, Green Houses, Conservatories, Orchard Houses, etc., with the various modes of Ventilating and Heating. Post-paid, \$1.50.

Wheeler's Rural Homes.—Houses suited to Country Life. Post-paid, \$2.00.

Wheeler's Homes for the People.—100 Original Designs, with full Descriptions, and Constructive and Miscellaneous Details. Post-paid, \$3.00.

Harney's Barns, Out-Buildings, and Fences.—Containing Designs and Plans of Stables, Farm Barns, Out-Buildings, Gates, Gateways, Fences, Stable Fittings and Furniture, with nearly 200 Illustrations. Royal quarto. Post-paid, \$6.00.

Eveleth's School-house Architecture.—A new and original work, containing Seventeen Designs for School-houses, Sixty-seven Plates with Perspectives, Elevations, Plans, Sections, Details, Specifications all drawn to working scale, with methods of Heating and Ventilation. Large quarto. Post-paid, \$6.00.

Copley's Plain and Ornamental Alphabets.—Giving examples in all styles, together with Maps, Titles, Borders, Meridians, Ciphers, Monograms, Flourishes, etc., adapted for the practical use of Surveyors, Civil Engineers, Draughtsmen, Architects, Sign Painters, Schools, etc. Post-paid, \$3.00.

HO! FOR IOWA

HOMES, at \$5 and \$6 per acre, on long time. Over 1,500,000 acres Railroad Lands, free from mortgage, for sale by the Iowa Railroad Land Co., all on the C. & N. W. & Ill. Central Railway lines, in the middle region of Western Iowa, the richest farming belt in the West. Pure water abundant. No fever and ague. Send for a land guide. It costs nothing, and gives every needful information. Address

THE NEW METHOD OF TREATING RUPTURE.—It is a comparatively short time since the Elastic Truss Company introduced the new method of treating Rupture which is now so universally adopted by the well-informed portion of the community. No Ruptured person who has once seen the new Elastic Truss sold so cheap at 683 Broadway, New York, would wear any of the old-fashioned metal or "finger-pad" torturing spring trusses any sooner than he would wear copper-seated trousers with sheet-iron knees riveted down the seams. The new Elastic Truss will hold the worst cases of Rupture absolutely secure with perfect ease and freedom from inconvenience. It readily adapts itself to every motion of the body, still holding the Rupture during the hardest exercise or severest strain in horseback riding, in pitching hay, etc. If directions are followed a perfect and permanent cure will be gradually but surely effected. Full descriptive circulars, with abundant testimonials, will be sent on application to the Elastic Truss Co., No. 683 Broadway, New York City—who send this new and wonderfully effective Truss by mail if desired.

Oranges from Seed.—Some time ago we stated, in reply to a correspondent, that oranges from the seed would not be precisely like the parent fruit from which the seed was taken. Several correspondents in Florida wrote that this was a mistake, and that the fruit was reproduced with exactness. We now find our position sustained by the Florida Agriculturist. While seeds from the sweet orange will produce trees bearing sweet fruit, they will differ in other qualities, including productiveness, and the only sure way of perpetuating a variety and preserving every one of its qualities and peculiarities unchanged is by budding or grafting.

Bogardus Bone-Mill.—"Englishman," Lynchburg, Va. The Bogardus bone-mill, to which we have before referred as the best bone-mill, may be procured of A. Bogardus & Co., Center street, New York.

PHASES OF THE MOON.

Table showing moon phases (Full, 3d, New, 1st) and times for Boston, N. York, Wash'n, Cha'ston, and Chicago.

AMERICAN AGRICULTURIST.

NEW YORK, APRIL, 1874.

We have had a remarkably mild winter, and the indications now are that we shall have an early spring. Winter wheat, on our own farm, and we believe it is so generally, never looked better. It is, of course, still liable to many drawbacks, but on the whole there is a good prospect of an abundant wheat harvest. We hope such will prove to be the case. The country needs a big wheat crop and liberal prices. We hope for both the present year. There is a cheerful prospect for all good farmers. We have had gloomy times. It has required strong faith to keep on improving the land, paying high wages, and getting low prices. But those who have now got their land dry, clean, and rich are in a condition to reap the reward of their faith and practice. This is the great lesson taught by all agricultural history and experience. Do the work as cheaply and economically as possible, but do it, and do it thoroughly. Slipshod farming; resorting to temporary expedients; checking weeds, instead of killing them; sowing when there is no reasonable prospect of getting a good crop, and doing this year after year is about the meanest business an intelligent man can engage in. Farming is a pleasant, profitable, honorable, and eminently useful occupation—but it must be good farming. Poor farming, with no efforts to improve the land and the stock is forlorn drudgery.

Farming is essentially slow. The husbandman waiteth patiently. He must look ahead. He lays plans and does work for the future. And the better he plans and the more he works and the farther he looks ahead, the more pleasure will he have day by day and the greater will be his ultimate profit.

Hints about Work.

Happy is the farmer who has got everything ready for the active labors of the coming season. But no matter how thoroughly he is prepared there will always be a plenty to do.

Work makes work.—Something will break and has to be mended. Something will be lost and has to be found. Tools are scattered here and there and must be put in their places.

System and Order are absolutely essential to success in farming. But work is no less essential.

Whatever accomplishes the most work at the least cost is the best system.

"Come Boys," must be the motto of the farmer who employs much labor. He must be with his men. But unless he is a remarkably vigorous and healthy man he ought not to try to do as much work as his men and superintend his farm besides. Work occasionally, and put new vigor into the men. Show them how to do the work to the best advantage. Plan, direct, be quick to see the weak spot and prompt to lend a helping hand.

Steady Work like plowing will almost do itself. It is the odd jobs that require brains. You must do the thinking.

A good Boy will often do as much work as a man. But you must know how to treat him in order to make him useful. Give him the best tools, the best plow, the steadiest team and the newest harness. If he breaks anything do not scold, but help him to repair damages and encourage him to do better. Above all do not let the men impose on him. If you breakfast early, a growing boy that is at work in the field should have a lunch at half-past nine or ten o'clock. No one can work long without eating, especially a growing boy.

Rainy Days are usually numerous this month. But you will find work enough that needs doing in the cellar or in the sheds or barns.

A Cheap Memorandum Book in which you can note down work to be done, is of great advantage—provided you use it.

Work to be done may be classified under three heads. First, Work for rainy days; Second, Work for fair days when the ground is too wet to plow; Third, Regular farm work when the weather and land are both dry.

Under Rainy Days would come such work as repairs, oiling harness, sorting potatoes, and cutting them for seed; mixing ashes, plaster, and hen droppings; whitewashing; cleaning and oiling implements and machines with petroleum, both wood-work and iron; grinding spades, hoes, axes, etc.; cutting up hay, and a dozen other things that will readily occur.

Under When the Ground is Wet comes underdraining; cleaning out ditches, letting off surface water; repairing fences and gates; piling, turning, or spreading manure; washing fruit-trees with lye or carbolic soap; scraping up the mud and scattered manure in the barn-yard; blasting large stones, etc., etc. The morning after the next heavy rain, fill up the list yourself. You will find it very useful.

Under Regular Work include the general field work of the farm, such as plowing, harrowing, cultivating, rolling, drilling, picking off stones, hauling manure, etc., etc. Go into details. Make estimates of how long the work will take, and see that you have everything ready for emergencies.

Sowing Clover on winter wheat is usually done before the frost is fairly out of the ground. If delayed till the land is dry, harrow the wheat with a light harrow before sowing the clover and then harrow or roll afterwards. Six quarts of clover and four of timothy per acre is none too much seed. If possible select a still day for sowing. See that there is no space left unsown.

Get Crops in Early, but not before the land is in good working condition.

Spring Wheat is usually the first crop sown.

Barley can not be sown too early, provided the land is in the proper condition. It should be made as fine and mellow as possible. Sow from 1 1/2 to 2 1/2 bushels per acre. Barley and spring wheat are both good crops with which to sow clover and grass seed. Make the land as fine as possible by repeated harrowings before sowing, and then roll after the grass seed is sown.

Oats or Peas do better on a recently inverted sod than barley. But if the sod is old and tough it is better to plant it to corn.

Potatoes require dry land. A rich, clover sod is excellent. But if the land is rich enough potatoes can be successfully grown after any crop. If

manure is used it should be well rotted and fine, and the more thoroughly it is mixed and incorporated with the soil, the less likely it is to injure the quality of the potatoes. Peruvian guano is one of the best auxiliary manures for potatoes—say 200 pounds per acre sown broadcast, or a tablespoonful dropped in the hill and mixed with the soil before dropping the potatoes. The latter is the better way to apply it, provided the work is done carefully. Peruvian guano, if a good article, will burn the potatoes if they come in direct contact with it.

On Sod Land it is far more convenient to plant potatoes in hills, three feet apart, than in drills. On mellow, rich land, where furrows can be opened with a plow, it is a good plan to make the furrows 3 feet apart and drop the sets in the furrow every 15 or 18 inches and cover with the plow. If the land is rich enough a larger crop can be obtained in this way than by planting in hills.

Harrowing the Potatoes with a light harrow, just as soon as they begin to break the ground, will kill millions of young weeds and favor the growth of the potatoes. On our own farm we use a Thomas harrow for this purpose, and go over the ground three or four times. We have frequently used an ordinary harrow. It pulls up a few hills, but not enough to do serious damage to the crop.

Mangel Wurzel is a favorite crop with us. It requires rich land. Should be sown early in drills, 2½ feet apart, and thinned out in the rows, 12 to 15 inches apart. If drilled in, 4 lbs. seed per acre; if dibbled in, 15 inches apart, 2 lbs. is sufficient. In the latter case soak the seed for 48 hours.

Animals require special care at this season. The weather is very changeable and horses and cows are shedding their coats and liable to catch cold.

Sheep must be managed according to circumstances. If the yards are large and dry and you have plenty of roots it is probably best to keep them out of the pastures until there is a good bite of grass. If the yards are small and muddy it will be well to let them run out every fine day. A sod field that is to be plowed for corn will make a good run for them and will save the regular pasture. Feed all the hay they will eat. It is a great mistake to stop feeding hay and grain as soon as the sheep are turned to pasture. They may not eat much hay, but they should have access to it and be allowed to eat at will.

Ewes and Lambs need warm, dry, sunny quarters. Feed the ewes a plenty of bran, early cut clover or other hay and as many roots as can be spared. Unless the ewes are very fat, a pound of oats each per day may be fed with great advantage. Be careful to avoid exposing the sheep and lambs to rain storms. If a lamb gets chilled, wrap it in a warm blanket; or, in extreme cases, put the lamb in a tub of warm water. Lambs apparently dead have been restored in this way.

Horses.—Feed liberally and allow plenty of time to rest and digest their food. It is better to work them steadily for eight or nine hours than to keep them in the field ten or twelve hours, letting them stand still one third of the time. When a man needs to go home to lunch or supper the horses need food also. A pail of water with a pint of corn or oat meal stirred in it is a capital thing for a tired horse. It will enable him to work an hour or two longer in an emergency.

Cows should be carded every day. See Hints for last month in regard to calving. It is especially important to feed new milch cows liberally and with good judgment at this season. Do not be in a hurry to turn them out to grass. Give plenty of early cut hay and have enough to keep their bowels moderately loose. If thin, give a little corn-meal or oilcake meal in addition. Cut the hay, moisten it with water, and mix about two quarts of bran and a quart of corn-meal with a bushel of the chaffed hay and let the cows have all they will eat up clean. When turned out into the yard, let them have a little long hay in the racks to pick at. A cow giving milk needs a great deal of water. Let her have access to it all day, or at any rate

night and morning. If you can give each cow half a bushel of mangels, or beets, or parsnips, or carrots daily it will be of advantage.

Swine.—It now looks as if pork would next fall and winter bring higher figures than for the last two or three years. Many farmers in the West say it does not pay to feed out "fifty-cent corn." We think they are wrong. At any rate one thing is certain, if pigs are kept at all it will pay to keep them in good growing condition.

Last Fall Pigs should be fed very liberally at this season, in order that when they are turned out to grass or clover they may be strong and vigorous. If they are fat now they will keep fat all summer on good clover. With us this is the cheapest way to make pork.

A Sow should be placed in a warm, comfortable pen some days before she is expected to farrow. The object is to let her get accustomed to the new pen. It is well to let her out every day for exercise before she pigs and occasionally afterwards. Give a little flax-seed tea or oil-meal slops and bran to keep the bowels open.

After Farrowing give her for a few days thin, warm bran slops three times a day. Gradually give richer food, such as oat, corn or pea meal, mixed with bran and mixed with slops from the house or with milk. If cooked and fed warm it will favor the production of milk. With well-bred sows the milk is often too rich, and we should aim to feed in such a way as to increase its quantity, but not its quality. Perhaps there is nothing better for this purpose than brewers' grains, or warm whey, or skim-milk and scalded bran.

Work in the Horticultural Departments.

The warm, sunny days of April will be the signal for the commencement of active out-door operations. To him who has completed everything which could be done to advance the spring work, the coming labors will be comparatively easy; but if these have been neglected there is great danger of falling behind with work. Gardening, to reach the greatest success, requires as much forethought as any mercantile business, and he who has the clearest head, combined with energy and skill, will be the most successful. Hurry up all the little jobs which can be done now, and then when the ground becomes warm and dry no delay need occur in plowing and putting in the various crops. Provide some in-door work for the men for rainy days; these will happen often during the season, and the men feel better when there is something to occupy their attention than if idle. Nothing is better for this purpose than a tool-house supplied with a good set of carpenter's tools and other necessary implements in constant use in and around the garden and buildings. Provide duplicate handles for the forks, hoes, etc., so that if any accident should occur they can easily be repaired. See that all broken tools are mended or new ones put in their places. Nothing so discourages a workman as a broken or poor tool. Teams which have been idle during the winter must be put to hard work gradually; otherwise they are liable to give out.

Orchard and Nursery.

Cions.—If not yet cut, attend to it at once, as it will not do to cut after the buds have started. Preserve in sand or sawdust until needed.

Root Grafts.—Plant in nursery rows as soon as the ground will allow.

Seeds of fruit and ornamental trees should be sown as soon as the ground is in good condition. Peach-stones, nuts, etc., which were buried in boxes in the open ground last fall should be planted at once before they commence to grow.

Grafting.—Do not commence until the buds swell. If left until too late the bark slips so readily that there is danger of injuring the tree by peeling.

Tree Planting.—In planting, do not attempt to do it hastily; one tree planted well is worth a dozen poorly set. Take pains to break all lumps which

come in contact with the roots, and, besides, make the hole large enough to allow the roots to lie straight in their natural positions.

Insects will still need looking after, as eternal vigilance is the price of healthy trees and good fruit. Wash the trunks and larger limbs with lye or soft soapsuds if not already done; this, if done with a stiff brush after the old bark has been scraped off, will destroy most of the eggs of insects. Look out for the rings of tent-caterpillars' eggs on the ends of the twigs; they can be easily seen and destroyed now.

Fruit Garden.

Currants.—Every garden should have an abundant supply of currant bushes, as with proper care they may be made to yield large crops of fruit, both for market and home use. Plant cuttings in rows two feet apart, and the plants six inches in the rows. In two or three years they will make bearing plants. Versailles and White Grape are the best varieties for general cultivation.

Strawberries need to be set out as early as the ground can be worked. Give the newly-planted beds, as well as the bearing ones, a good mulch of cut hay or straw, or even leaves. Set the plants in hills 18 inches apart, with the rows two feet. Do not allow the newly-planted beds to bear before the second year, as the plants will then be stronger and better able to bear good crops afterwards.

Raspberries and Blackberries must be set out early this month if the ground is dry. Four feet each way for raspberries and 6 x 8 feet for blackberries.

Grapes.—Set out vines one year old in well-drained soil which has been enriched by ashes or ground bone. Do not use heating manures, as they cause a very rapid growth, which is so prolonged that the wood does not have time to ripen properly before cold weather commences; hence the wood is readily injured by frosts. Select a proper proportion of early, medium, and late sorts, so that there will be a constant succession of fruit throughout the season. Cuttings preserved in the cellar since last fall should now be planted out in rows 18 inches apart, setting the cuttings four inches apart in the rows, and pressing the earth very firmly down around the bases of the cuttings.

Gooseberries.—Set out Houghton and other American varieties. Give thorough cultivation and plenty of manure.

Quinces.—A handsome pyramidal quince-bush can be secured if properly trained and pruned; as usually seen, they are not ornamental objects.

Figs can not be grown profitably north of the latitude of Maryland, but a few trees are easily taken up and stored in the cellar in the fall, and when planted among other fruit trees they give a pleasing variety.

Kitchen Garden.

For directions for making hot-beds last month's hints may be consulted, and also for many other operations which will be in season for the present month. Hot-beds must be carefully watched lest the heat become strong enough to burn the young seedlings. Remove the sash when the weather will allow; when too cool to remove admit air by raising the sash a few inches at the back.

Asparagus.—Remove the coarse litter from the beds and fork in the manure as soon as the ground is dry. Apply a coat of salt to established beds.

Beans.—In the Northern States the latter part of the present month is early enough for planting; however, it will be worth a trial to plant a few rows now, and if there is any danger of frosts protect the young plants by placing two boards edgewise, like an inverted trough, along the rows so that they will form a shelter for them.

Beets.—Sow as early as the state of the ground will allow, as they will stand considerable frost.

Cabbages and Cauliflowers.—Set out plants from the hot-bed and cold-frame in rows 18 x 24 inches, and plant lettuces between; the latter will be out

of the way before the room is needed for the eabages. Sow seeds in open ground.

Carrots.—Sow a few rows for early use in warm, rich soil in drills a foot apart; put in plenty of seed to insure a good start.

Celery.—Set out plants for early crop. Sow seeds in drills eight inches apart.

Chives.—As soon as the soil is dry fork in a dressing of fine manure around the plants and remove all the old leaves. New beds may be made by division of the plants.

Cucumbers.—Sow a few seeds in pots or bits of sod in a hot-bed, so that they can be readily removed as soon as the weather is warm enough. Do not plant in open ground until next month.

Egg-Plants.—Sow in hot-bed giving considerable heat, and take care not to check growth untimely by removing the sashes.

Garlic.—Set bulbs in rows 12 inches apart, allowing six inches between the plants.

Horseradish.—Plant out sets in rows, in well-manured soil, 24 x 15 inches.

Herbs.—A supply of the more common herbs should be sown. Sage, thyme, summer savory, etc., are in general use for flavoring. Sow in a warm place or frame in rows four inches apart.

Leeks.—Sow seed as early as possible in fine soil in fifteen-inch rows.

Lettuce.—Set out plants from the cold-frame in rows a foot apart, and the plants six inches in the rows. There are many vacant spots where a few plants may be set.

Onions.—The sooner the seed is put in after the ground is open the better is the prospect for a crop. In sowing, radish seed is sometimes mixed with it, which allows the rows to be seen readily and the weeds sooner hoed up between the rows. Plant in rows 15 inches apart. Top and potato onions should be set at once in rich soil.

Parsley.—Sow in hot-bed or open ground, first soaking the seed in hot water a short time.

Parsnips.—Sow at once in very rich deep soil, so that they may get a good start before very warm weather. Sow in rows 15 inches apart.

Peas will bear considerable frost, and the sooner they are planted the better they will yield. Do not plant the dwarfs until the ground is warm and dry.

Peppers require to be treated the same as recommended for egg-plants.

Potatoes that have been cut and started in the hot-bed may be set out at once in rows two to three feet apart, and one foot in the rows. Plant all garden sorts early.

Radishes.—Sow a few rows every week or ten days during this month. Sow thickly in rows one foot apart.

Salsify and Scorzonera.—These two vegetables ought not to be neglected, for if once raised we think they will always form a part of the gardener's crops. Their culture is the same as for carrots.

Spinach.—Keep down the weeds in the beds sown last fall, and sow seed in rows a foot apart.

Seeds.—Persons raising their own seeds should set out the most perfect specimens of beets, parsnips, etc., early.

Tomatoes.—It is yet too early to trust plants in the open ground. The earliest should be transplanted to pots or boxes, where they will have more room to grow, and so that they can be readily removed without injuring the roots.

Turnips.—Sow a few rows for early use, and as soon as they are up sprinkle with plaster to preserve from insects.

Flower Garden and Lawn.

There will be plenty of work in this department on the opening of spring weather. Rubbish, broken limbs, and everything which can disfigure the appearance of the garden and its surroundings should be cleared away.

Lawn.—Apply a dressing of bone, ashes, or other

fertilizer. If any patches are thin or bare sow seed thickly after loosening the soil with a rake.

Bulbs which were planted last fall should have the covering of hay or leaves taken off, and the ground loosened around the plants, which will just now show themselves above the ground.

Ornamental Trees.—Set out such varieties as are needed for shade or ornament. Evergreens do best if not moved until May.

Annuals.—Sow seeds of the hardy kinds.

Herbaceous Perennials.—Move and divide at once if not yet attended to, as many of the sorts will commence flowering soon. A light, loamy, well drained soil is the best for most sorts.

Biennials.—Transplant such plants as Hollyhocks, Sweet Williams, etc., from the beds to where they are to flower; the earlier this is done the better.

Climbers.—Provide plenty of climbers for ornamenting and covering porches, arbors, and rustic-work. Clematis, Trumpet-creeper, Honey-suckle, Wistarias, Akebia, and the like are very ornamental both in flower and foliage, and many an otherwise bare-looking spot can be easily covered by these hardy climbers.

Hedges.—Trim and stir the soil around the plants as early as possible, and if any new hedges are wanted order the plants at once.

Wind-breaks are very useful, as well as necessary in a flat country, and trees to serve this purpose should be planted wherever needed. Norway Spruce is one of the best evergreens for this purpose, as it is of rapid growth.

Drives and Walks should be laid out and made at once, for if left until later there will be too much work on hand to do it properly.

Greenhouse and Window Plants.

Ventilation is the main point to look after now. Admit air every warm day, so that those plants which are to be set out in the open border may be properly hardened off.

Propagation of the desirable sorts may still be continued, and the plants, as soon as rooted, potted and placed in shade until established.

Seeds.—Sow seeds of annuals in greenhouse or window boxes. Balsams, Asters, etc., do better if started in this way.

Insects.—Keep the greenhouse clear of insects by smoking, washing, etc. The red spider may be destroyed by keeping the house damp.

Camellias which are growing should have plenty of water and a little more heat.

Azaleas.—Prune and bring into shape by judicious tying as soon as the plants have done flowering.

Bulbs that have completed their growth of leaves may be turned out of the pots and stored in a dry, cool place. Ixias and other greenhouse bulbs should have plenty of water while flowering.

Tuberose.—Start bulbs in the greenhouse for planting outside.

Cannas and other tropical tuberous-rooted plants do better if started in a little heat and planted out-of-doors from the first until the last of May, according to locality.

Plants wintered over in the cellar will need looking after, and water given occasionally as needed.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, from our daily record during the year, show at a glance the transactions for the month ending March 13th, 1874, and for the corresponding month last year:

Table with 2 columns: RECEIPTS and SALES. Rows include Flour, Wheat, Corn, Rye, Barley, Oats, and various other agricultural products with prices for 1874 and 1873.

Table 2: Comparison with same period at this time last year. Rows include Receipts for Flour, Wheat, Corn, Rye, Barley, Oats for 24 and 23 days in 1874 and 1873.

Table 3: Stock of grain in store at New York. Rows include Wheat, Corn, Rye, Barley, Oats, and Malt for various dates in 1874 and 1873.

Table 4: Exports from New York, Jan. 1 to March 12. Rows include Flour, Wheat, Corn, Rye, Barley, Oats, and Peas for 1874 and 1873.

Gold has been up to 113 and down to 111 1/2—closing March 12th at 112 as against 112 1/2 on February 12th. All things considered, a remarkably active movement for the season has been noted in the leading kinds of Produce, the receipts and sales of Breadstuffs having been in excess of those of the same time last year. The business in Flour, Wheat, Corn, and Rye has been in good part for shipment. Under the liberal arrivals prices generally yielded, but closed with more steadiness. The scant supply of freight room available for prompt use has been against the export trade. The dealings in Barley have been less extensive, and at lower figures. The offerings of foreign have been large and urgent, partly to arrive. Oats have met with a ready sale, mostly for local trade purposes, and have held their own well as to values. The inquiry for the principal kinds of Provisions has been fairly active, but at variable prices, closing more firmly. Butter and Cheese dearer, and in good request. Eggs closed lower, with a very moderate demand from consumers. Cotton has been quite freely purchased, but closed in favor of buyers. Wool has been less sought after and rather less firm. The better grades of domestic have been in quite moderate supply. Manufacturers have been operating reservedly. Tobacco, Seeds, Hay, and Straw have attracted less attention. The offerings of Hay and Straw toward the close were on a liberal scale. Hops have been very dull, and generally weak; though strictly prime to choice stock was held with a fair share of confidence, having been comparatively scarce.

CURRENT WHOLESALE PRICES.

Table with columns for Feb. 13 and March 13. Rows include Price of Gold, Flour, Wheat, Corn, Rye, Barley, Oats, and various other commodities with prices for both dates.

New York Live-Stock Markets.

RECEIPTS.					
WEEK ENDING	Beesves.	Cows.	Calfes.	Sheep.	Swine. Tot'l.

do. do. prev's Month.....	7,042	62	617	20,219	34,388

Beesves.—The month's business has been characterized by dullness and depression, although prices have not given way. The reduced receipts, however, finally told upon the market, and with the disappearance of stale stocks of dressed meat a general improvement occurred. This was apparent in the tone of the market rather than in prices, as may be seen by the latest quotations, which show no actual advance. On the whole, however, less quality was given for the same money at the close than at any previous time during the month. Texans sold at 9 1/4 c. @ 10 c. 3/4 lb. to dress 56 lbs.; native steers at 10 c. @ 12 1/4 c. to dress 56 @ 58 lbs.; extra and fancy brought 12 1/2 c. @ 13 c. to dress 58 @ 60 lbs. A year ago the choicest steers brought 13 1/2 c. @ 14 1/2 c. 3/4 lb., although the average of the market was but 1/2 c. 3/4 lb. above our present quotations.

Prices for the past five weeks were:

WEEK ENDING	Range.	Large Sales.	Aver.
February 16.....	7 @ 13 c.	10 @ 10 1/2 c.	10 1/2 c.
February 23.....	8 1/2 @ 13 c.	10 1/2 @ 10 1/2 c.	10 1/2 c.
March 2.....	8 1/2 @ 13 c.	10 @ 11 c.	10 1/2 c.
March 9.....	8 1/2 @ 13 c.	10 1/2 @ 11 c.	10 1/2 c.
March 16.....	8 1/2 @ 13 c.	10 1/2 @ 11 c.	10 1/2 c.

Milk Cows.—For cows the market has been quiet but steady; all have been readily sold that were offered at \$40 @ \$30 for cow and calf. . . . **Calves.**—There has been a steady demand for hog-dressed veals, and at the close an easy market prevailed at 11 c. @ 13 1/2 c. 3/4 lb. for fair to good. Milk-fed gradually weakened, closing at 6 1/2 c. @ 7 1/2 c. 3/4 lb. Good to choice grass calves closed at \$12 @ \$15 3/4 head. . . . **Sheep.**—After a dull market for the month, with falling prices, an improvement could be noticed at the close. The feeling was firmer, but buyers resisted effectually the advances of sellers, and sales were made at 5 1/2 c. 3/4 lb. for common, up to 8 c. @ 8 1/2 c. 3/4 lb. for extra lots. . . . **Swine.**—Live hogs have been neglected, and the market is reported as closing dull at the reduced rates of 5 1/2 c. 3/4 lb. for common to good, and 6 c. 3/4 lb. for the best. Dressed hogs closed in fair demand at 6 1/2 c. @ 7 c. 3/4 lb., and for Western at 7 c.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money: — Checks on New York City Banks or Bankers are best for large sums; make payable to the order of **Orange Judd Company.** Post-Office Money Orders for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

Postage: On *American Agriculturist*, 12 cents a year, and on *Hearth and Home*, 20 cents a year, in advance. Double rates if not paid in advance at the office where the papers are received. For subscribers in British America, the postage, as above, must be sent to this office, with the subscription, for prepayment here. Also 20 cents for delivery of *Hearth and Home* and 12 cents for delivery of *American Agriculturist* in New York City.

Bound Copies of Volume Thirty-two are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the last seventeen volumes (16 to 32) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Clubs can at any time be increased by remitting for each addition the price paid by the original members; or a small club may be increased to a larger one; thus, a person having sent 10 subscribers and \$12 may afterward send 10 more subscribers with only \$3; making a club of 20 at \$1 each; and so of the other club rates.

**REMEMBER THAT
Three Months
REMAIN
For Premiums.**

April, May, and June are the three months remaining, during which any person who wishes to obtain one or more of the useful and valuable articles offered in our Premium List (of which a copy will be sent free to any applicant, see page 159) can easily get them. This has already been done by more than 14,000 persons, who during years past have tried with success the raising of Clubs of Subscribers for our papers, and availed themselves of the liberal offers of Premiums made by the Publishers.

We invite all our Subscribers to take hold of this work and secure a Premium while the offer is open. Specimen copies of both papers will be sent to any wishing to show them for this purpose.

Our Western Office.—Our friends in the West are reminded that we have an office at No. 4 Lakeside Building, Chicago, Ill., in charge of Mr. W. H. Busbey. Subscriptions to *American Agriculturist* and *HEARTH AND HOME* are taken there, and sample copies of the papers and chromos are delivered, and orders received for advertising on the same terms as in New York. All our books are on sale at the Western Office. Please call and examine, buy, subscribe, and advertise.

Good Books.—We call the attention of all our readers to the list of books for the farm, garden, and household, which will be found on the third cover-page of this paper. No better investment can be made than that which supplies the home with interesting and instructive reading matter.

New Books.—The Orange Judd Company have just issued, in attractive duodecimo form, John Estlin Cooke's story, "Pretty Mrs. Gaston," illustrated by Bush; price, post-paid, \$1.50. Also "John Andross," by Rebecca Harding Davis; price, post-paid, \$1.50; finely illustrated by Fredericks.

P. T. Quinn's Horticultural Works.—By a natural gravitation the few rural books not originally published by the Orange Judd Company, one by one fall into their list. The latest accessions are "Pear Culture for Profit," and "Money in the Garden," by P. T. Quinn. We have already favorably noticed these works, and have only space to say that new issues of both volumes are now ready.

A New Fertilizer.—R. H. Allen & Co., N. Y., offer a new fertilizer, the nitrogen (or ammonia) in which is derived from dried blood, the richest available source. The reputation of this house is sufficient to warrant that this fertilizer is what it is represented to be. Besides this they guarantee the amounts of potash, ammonia, and soluble phosphoric acid. This is deserving of the attention of those about to purchase fertilizers.

The Patrons of Husbandry.—The interest in this order in no wise diminishes. Indeed, the late meeting of the National Grange and its eminently clear presentation of the objects of the patrons would naturally direct attention to it anew, and lead those who before regarded it with indifference to now look upon it with interest. The disclaiming of political purposes has disappointed some who hoped to turn the order to account, and perhaps led to the establishment of the "Order of Independent Grangers," who make it one of their avowed objects to take political action. In reply to those who ask for sources of information in regard to the Patrons, we would say that O. H. Kelley, Georgetown, D. C., is the Secretary of the National Grange, and we assume, without knowing it to be the case, that he can supply circulars, etc., to those who wish to know more definitely about the order.

Watch Congress!—No law ever passed by Congress is more directly of benefit to the agricultural community than that allowing plants, seeds, and books to be sent by mail at reduced rates of postage. This law, which places settlers in new countries and all who live at a distance from commercial centers upon an equality with those who live near them, has been a

great help to the farming community. A proposition has recently been made in Congress to exclude from the mails everything but letters and papers; and while other countries are enlarging their mail facilities, it is proposed that America shall progress backward in this matter, and prevent the farmer from receiving his seeds and books at a low rate of postage. This proposition came up about the time the attempt was made to revive the franking privilege. We advise farmers and all interested in this subject to watch Congress; and this is a case in which it becomes the Patrons of Husbandry to be vigilant. Let your representatives know that whoever votes to exclude plants, books, and seeds from the mails is thereafter politically dead. Congressmen do not seem to be aware that farmers propose to have something to say hereafter in politics. Watch the men, and see not only how they speak but how they vote.

The Averill Chemical Paint.—Several years ago we had a new barn and two outbuildings to paint, and as at that time the Averill Chemical Paint was a comparatively new thing, we determined to try it. After we had purchased the paint we found the painters of the neighborhood much prejudiced against it, and they, by predicting all sorts of evil, endeavored to deter us from using it. At last we found a man who would apply it and not talk about it. The barn had one and the other buildings two coats. The paint was applied between four and five years ago, and is still in good condition. We have no occasion to regret having used it, nor any hesitation in recommending it to others. The paint is furnished in various tasteful shades of color, and what is a great advantage is ready for immediate application. As it requires no mixing, it is especially adapted to the use of those who live in the country and wish to do their own painting.

SUNDRY HUMBUGS.—Such a pile of letters and documents and such a tame lot does not often come before us. It is very easy to write us in regard to this or that man and request us to

SHOW HIM UP.

Our friends must not be surprised if such letters are unheeded. We take as much—even more—care to avoid accusing any one unjustly as we do to show up those who deserve that distinction. We must have evidence that places the matter beyond all reasonable doubt, before we place any one in this column. Often we feel quite sure that a scheme is a swindle, but refrain from publishing it for want of evidence that would convince a jury of twelve men, should it be brought before them. Our humbug correspondence has its amusing features, but it has also a pathetic aspect. It is indeed sad to read the complaints of some of the victims, and one loses his indignation that the writers should be such fools as to be caught with a badly baited hook, and feels only pity for those who mourn over money they could ill afford to lose. Some give their unhappy experience with the Union Furnishing Co., of Chicago, and ask that it be exposed. This was done weeks ago, and recent Chicago papers say that the place is closed.

THE KENTUCKY LIBRARY LOTTERY,

they call it "gift concert," as it sounds less offensive—even publish a paper in the interest of the scheme. This sheet informs us that the 4th "grand concert" will take place on March 31st. These lotteries will probably continue as long as fools have money to throw away in the purchase of its tickets. In order to clothe the affair with an air of respectability an ex-governor is put in as manager. But all the governors past, present, and to come, will never make this other than a disgrace to the state.

THE MAGNOLIA, IOWA, LIBRARY CONCERT

is a precious specimen of a swindle, and Maynard & Co., of Magnolia, are about as sweet a set of scoundrels as ever tried to cheat a man out of \$10. These fellows send a "special notice," of which we give an extract from one of quite a file before us:

"At the grand award of gifts, Jan. 20th, we are pleased to inform you that your ticket, No. 142068, was awarded one of the miscellaneous gifts, valued at \$200. You will see by referring to circular sent to you, that on all miscellaneous gifts 5 per cent. on the valuation of each miscellaneous gift is required before the delivery of the gift, and 10 per cent. is to be deducted from each cash gift. Therefore 5 per cent. on your gift amounts to \$10, which must be sent to us, together with the ticket, within 15 days from the day you receive this notice, or the gift will be forfeited.

"Therefore if you desire the gift to be sent, remit \$10 at once." Here comes an important caution: "In sending money inclose the bills in your letter, carefully folded, seal closely, write our name, town and state plainly, and send the letter by regular mail and it will come safe, or if you desire you can register your letter, or you can send us drafts on New York or Chicago, but you must not send postal money orders, as none but distributing offices have sufficient funds on hand to pay, and it might be two months before we could get the money, when would prevent our filling your order that length of time, so be particular to send bills in letter or drafts on New York or Chicago.

"In case your ticket has been mislaid or lost, the facts must be stated and the gift will be sent and the number cancelled of record on receipt of money."

This Maynard & Co. know enough of the bad side of human nature to feel quite sure there are others in the world as big rascals as they are, and that now and then there will be found one who will take the bait and pretend that he had a ticket and lost it. Later letters show that likely the people of Magnolia have made the place too hot for them, as they contain a notice as follows:

"Since printing our notifications we have discontinued our office at Magnolia, owing to the inconvenience of its mail facilities, and hereafter in no case must any money or communication be sent to us at that office.

"Owing to the strong desire on the part of our people and the legislature to discontinue this line of business, we have decided to lend our aid in the cause of moral reform, and consequently will conduct no more distributions, and in closing up our business we simply follow our line of duty to our patrons on promises made in the past, and with many kind wishes, we are,

"Very truly yours,
MAYNARD & Co."

Then follows the address of their "financial agents" in Chicago. "Moral reform," indeed! and they propose to close up their business by getting as many times \$10 as there are fools who will send it.

There are Prize Associations in New York which do "business" on the same principle. They kindly send a ticket that has already drawn a prize, and the recipient can, by paying \$1 for the ticket and \$6.50 for "express charges and packing," have a "rosewood melodeon, valued at \$90." While on this lottery business we may add that no one need write to ask us to find out if this or that lottery has been drawn, or to see if it is true that such a ticket has drawn a prize. We can not be accessory to any such transactions. Some

WALL STREET "BROKERS"

seem to have been sending out circulars quite freely all over the country, and letters come asking if it would be safe to put money in the hands of these parties for investment. Safe! yes, indeed! The money would be so safe that the one who invests would never see it again. We advise our friends in Illinois and elsewhere to keep just as far from such "brokers" as possible. . . . If any one wishes to get cheated on a cheap sewing machine they need not send to Montreal for the purpose. They can get accommodated in Greenwlich street. . . . Victim—it should have been victim—sent \$5 for a Parisian watch and chain, and actually expected to get one. What is stranger still he sends his documents, including that lithographed letter acknowledging the money and promising to send in six weeks, to us and asks us to collect his \$5 for him. No, no, Mr. V. We have done our duty by these Paris and Geneva watch folks long ago, but you did not believe us, and wanted to "know how it is yourself." That \$5 is a first-class investment if it only keeps you from like follies hereafter. . . . The "8 pounds of butter from a gallon of milk" man is around yet. At last accounts he victimized them at Barnesville, O. . . . One Mitcham fairly shrieks in his circular for people to send him \$1 for his book that tells "how to make from \$5 to \$20 a day without capital." No, it is not likely that Mitcham gets \$20 a day for this book, and he invests capital in circulars and postage, to say nothing of the rare talent displayed in writing such a touching production. We charge M. nothing for the advice to go to work on his own plan and save this outlay.

MEDICAL HUMBUGS.

A friend in San Jose, California, sends a request that we show up the "New York Medical University" as a notorious humbug, as he has nearly killed himself by taking their "vile nauseating compounds." This gentleman can not have read the *Agriculturist* carefully, as we long ago stated that there was no such "University," except so far as some quack medicine dealers chose to call themselves one. Medical colleges—a "Medical University" is a misnomer—never advertise medicines or establish "Agencies" . . . Here is our old acquaintance, the Rev. Joseph T. Inman, whom we had for a long time lost sight of. Joe has turned up again, and is on the "South American Missionary" doodge yet. Intelligence of Joey T. comes this time by way of Grinnell, Iowa, where a good person is concerned because such a quack has ensconced himself in the Bible House. That shows where Joseph is "cute." Everybody does not know that one of the regular P. O. Stations is at the Bible House, and it looks quite the thing for a "Rev." to have his letters go to a place with so good a name. Inman is one of the humbugs of the past generation. . . . "The National Surgical Institute" has a branch, this time in Atlanta, Ga. Our Atlanta correspondent will find that we said our say about it last year. The persons who run it claim to be regularly educated surgeons. If so it makes the matter so much the worse; ignorant quacks might be excused for issuing such circulars, but for educated men—pah! . . . Here is another "Rev.," and this one's name is Edward Burnett, and he hails from Albany. The Rev. Ned plays the same old tune—he was a missionary. It was in Southern Asia this time, and he has sufficient of this world's goods (lucky boy!), and he does

not want to realize money (they never do), and he wants to "drive disease and death from the happy fireside" (that's right, go for 'em), and he sends his recipe "to you, fellow sufferer, from a sense of duty" (how lovely), and alas! that it should be so, people can not conveniently get the herbs of the prescription in their own town (or he might add any other), and although his time is very much occupied he will just put it up himself for \$3.03. How charmingly precise, but the Reverend Edward Burnett is some at figures, and as he will in no case "ask or accept a profit on the medicine," he has got the cost figured down to a dot—that three cents must convince the most skeptical of the self-sacrificing nature of this most excellent man. Burnett, don't you laugh yourself at the fools who get caught with this very stale old trick? Why the Rev. Inman mentioned above is ahead of you by ten or fifteen years. If you are a minister you should have respect enough for the calling to lay aside your title when you dabble in quackery. It looks more like a case of stealing the "livery of heaven to serve the —" Well, you know the rest.

COUNTERFEIT MONEY OR "QUEER"

seems to have revived a little since the panic subsided. It is the same old story over again, and it is of little use to publish names, as one rascal has no end of aliases.

ANY PARTY BY THE NAME OF CHASE

who wishes to go in for a share of that estate valued at \$386,000,000 (no odd cents) can take one step towards it by investing \$5 in three sheets of genealogy. Money sent to the Treasurer at Fall River, Mass., or to another Chase in Ohio, "will be safe," so says the circular, and we haven't the least doubt of it. Here, all you Chases, are all these millions lying round loose all for the want of a few hundred dollars to send a Chase to Europe on a wild goose chase. Who ever heard of one of these wonderful estates being secured by the heirs?

The Howard Mill.—"N. F. B.," Lexington, Ky. The Howard Mill may be ordered through any dealer of farm implements in New York, several of whose names appear in our advertising columns.

Asbestos Roofing.—"N. R.," Kinderhook, Ohio. About a dozen years ago we roofed a building with this roofing, as did several other persons in the neighborhood. We do not know of an instance in which it failed to give satisfaction, and in our own case, with an occasional coating of cement, the roof was in good order three years ago, since when we have not heard of it, and it is doubtless so now. The roof should have a slope of at least one foot in sixteen.

Arbor Day in Iowa.—A circular from the Iowa Horticultural Society names April 20th as Arbor Day. The appointing of a day for the planting trees throughout the state originated with Nebraska two years ago, and other states are following her example. The circular gives a list of premiums, varying from \$4 to \$30 each, for the greatest number of evergreen and the various deciduous trees planted. The premiums are to be awarded in October next, and only those trees that are then alive are to count. Besides the premiums and regulations, the circular gives notes on the proper methods of planting, etc. Copies may be had of Jas. L. Budd, Shellsburg, Benton Co., Iowa.

The Snyder Blackberry.—It is not our custom to say much about new fruits until we have tested them. As several have asked in regard to the Snyder Blackberry, a comparatively new variety, we have made inquiries and give their result without knowing anything of the fruit ourselves. The variety was found on the farm of a Mr. Snyder, whose name it bears, near Laporte, Ind. It has been in cultivation since 1851, but has not as yet been very widely distributed. We have before us letters from several well-known Western horticulturists, all of which speak of the good quality of the fruit, the prolific character of the plants, and especially of the surpassing hardiness of the variety. Indeed, hardiness is the great merit claimed for the Snyder by those who are introducing it, and their statements are sustained by what seems to us abundant evidence. At all events we have ordered some plants of Mr. J. R. Gaston, Normal, Ill., and shall know more about them hereafter.

Nebraska and Minnesota Lands.

There are no lands better adapted to the growth of wheat or grass than those in Nebraska and Minnesota. The fine valleys of the Missouri, the Platte, and the Red rivers in these States are now opened to settlement by the Burlington and Missouri, the Union Pacific, and the St. Paul and Pacific Railroads. These companies are anxious to dispose of their lands and give every facility to purchasers by means of exploration tickets, reduced fares to colonies, cheap prices on the easiest terms, and

convenient accommodations to immigrants. Thousands of successful settlers are now making comfortable homes in these rich and healthful valleys.

The Massachusetts Horticultural Transactions for 1873 are at hand. The reports of the committees are full and interesting, and the volume is produced in a very handsome style.

Play and Profit in My Garden, by the Rev. E. P. Roe.—When this book first appeared we commended it as one of the most genial of horticultural publications. Since then its publication has been assumed by the Orange Judd Company, and a re-issue is now ready. It is not only pleasant reading, but instructive and eminently timely.

Eggs and Plants by Express.—"T. T.," Healy, Montana. The vitality of eggs, carried from New York to Montana, would almost certainly be destroyed. It would at any rate be cheaper to procure a trio of fowls, which could be sent safely, than the eggs, although the first cost would be greater. Good fowls can be procured at Chicago or in Minnesota. Trees and plants, if properly packed, can be safely sent ten thousand miles if necessary. Trees have been safely shipped from Rochester, N. Y., to Australia.

Close Breeding.—We have received, through the courtesy of Professor M. Miles, advance sheets of the Report of the Secretary of the Michigan State Board of Agriculture for 1873, containing a very valuable paper upon Close Breeding, by Professor Miles, and which was substantially given in a lecture before the American Association of Short Horn Breeders, at their meeting at Cincinnati, Dec. 3, 1873. This paper is a remarkably effective defence of the practice of close or "in and in" breeding, as a scientific process in the hands of intelligent and thoroughly competent breeders. The accumulation of facts presented in this paper furnish an irresistible argument in favor of the position assumed by the Professor, which might perhaps be epitomized in the statement that close breeding is only the means of perpetuating the qualities which have been gained by other means, and does not in itself necessarily improve or injure animals, while, nevertheless, "close breeding" in the hands of incompetent, uneducated, unscientific persons is to be discouraged as almost certainly an injurious practice. This paper should be read and carefully studied by every stock breeder.

Vick's Chromo.—James Vick, the well-known seedsman, of Rochester, sends out a floral chromo annually. The one for the present year shows a large cross decorated with flowers, and is exceptionally good.

The Exhibition in Chili.—The government of Chili, the most progressive of the South American republics, announce their Second International Exhibition at Santiago, in September, 1875. This is a fair worthy the attention of our inventors and manufacturers. These and all others interested can obtain programmes from A. Villarreal, office of Ribon & Munoz, 52 Pine street.

Book Notices prepared for this month are necessarily crowded out. We would like to give especial notice to the very excellent "Elementary Science Series," now being issued in rapid succession by G. P. Putnam's Sons, N. Y., but have not space.

Landscape Gardener.—F. X. Heissingcr, from Germany, has established himself in New York as a landscape gardener. He has had much experience abroad, and his designs that we have seen show both taste and skill.

Peristrophe.—It is not a little surprising to read in the N. Y. Weekly Tribune the following: "Among the new plants out for the first time, none gave us more satisfaction than that lovely little golden-leaved beauty, or to load it with its full title according to the books, *Peristrophe angustifolia aureo-variegata*." As an offset to this gushing paragraph, we would say that the plant (which by the way is not new) though very fine for greenhouse decoration, has for several years proved perfectly worthless with us as a bedding plant. We have seen it in various gardens from Massachusetts to Georgia, and all we have seen who tried it are quite disgusted with it as an open-air plant.

Value of Corn and Bran.—"J. H. S.," Bourbon Co., Ky. Corn and bran can not be compared with each other as feed because neither can be fed alone to the best advantage. But equal measures of each ground together will make probably the most nutritious feed for either hogs or horses and a most excellent feed for cows.

Cabbage Plants.—Sometimes one can drop nothing and make trouble. Peter Henderson & Co.'s advertisement for last month offers plants of Jersey Wakefield Cabbage at \$1 per thousand. In making up the page a 0 dropped out. It should have read "\$10 per thousand"—and cheap enough at that.

Your Name.—Miss "R. E." writes to know if a certain journal is still published. Information of this kind, of interest to but one person, can only be given by mail. All making such inquiries should send a stamped and directed envelope, a directed postal card, or at least a letter stamp. Had the question been other than of personal interest, it would not have been answered, as the lady did not send her name. We can not notice anonymous letters, and we hope all readers will bear this in mind. Sign letters as you please, but give us the real name beside.

Purdy's Chromo.—A. M. Purdy, publisher of the Small Fruit Recorder, Palmyra, N. Y., sends out a fine fruit piece. It comes at the very moment of closing these pages, and we can only say that it is a very handsome and creditable production.

Sanford Corn.—"A. S.," West Brighton, N. Y., sends us his experience with what he purchased as the Sanford corn and which he understood was to be an early corn. It turned out to be remarkably prolific of fodder, but very sparsely so of seed, and his crop, planted on the 15th of May, failed to ripen at all, yielding about 30 bushels per acre of unsound corn.—Our own experience with this same corn was very similar. With us it was inferior to the common white flint corn. It would, however, probably succeed better in a lower latitude than that of New York.

Eleagnus parvifolius.—"S.," La Porte, Ind. This is a very neat shrub, and promises well as a hedge plant, but has yet to stand the test of extended trial. We saw a good stock of it in the nursery of Thomas Meehan, at Germantown, Pa.

Safe Oils.—"C. M.," Springfield, Mo. If there is no inspector of oils in your State whose brand is a safeguard, you must test the oil yourself. No oil should be used which gives off a vapor that will flash at a lower temperature than 110°. An inch of oil put in a deep tin cup and heated should not give a vapor that will take fire when a match is held above the oil at a less temperature than 110°. It is not convenient for every one to do this, as few have a suitable thermometer, but every grocer who sells kerosene oil should have an apparatus made for the purpose of testing it, and be able to assure his customers of its safety. Insist that your grocer shall give you good oil.

Poultry Book.—"C. H. H.," La Grange, Mo. L. Wright's Practical Poultry Keeper is probably the best work for those who desire to keep poultry for profit. It must be remembered that no one book of moderate size could be exactly adapted to every person's particular requirements. It will be always necessary therefore for the student to adapt his own circumstances to the general rules or ideas therein given, which any person of ingenuity ought to be able to do. If one can not do that, but must have particular directions for every emergency, he is not the man to succeed with poultry, which require more tact in their management than any other stock.

North-western Dairymen's Association held its annual meeting at Woodstock, Ill., commencing February 10th. The attendance was large and the proceedings interesting. The dairy interests of the North-west were shown to be exceedingly flourishing and the business profitable. The production of cheese had been sufficient to displace Eastern cheese to a large extent in Western markets and leave a surplus for foreign export. The burden of the speaker's remarks were the improvement of quality of cheese and butter by means of care in feeding, perfect cleanliness in milking, and in the dairy, order in every department, and honesty in all dealings. The following officers were elected: President, S. Favill, of Missouri; Secretary, G. E. Morrow, of Wisconsin; Treasurer, R. R. Stone, Illinois, with fifteen Vice Presidents, representing Iowa, Illinois, and Wisconsin.

Breaking Prairie.—"J. H. B.," Hastings, Neb. The common way of breaking prairie sod renders it necessary to plant a crop of sod corn or let the sod lie fallow until it rots, when it may be cross plowed. It is best to follow the custom of the country in this respect, especially for new beginners and those from England, where everything is so different from things here. By using two plows, one following the other, in

the same furrow, the sod may be covered with mellow soil, but it is doubtful, even then, if clover or mangels would thrive the first year. The sod requires reclaiming by a process of rotting or decomposition before it is available as food for plants. We would advise you to keep the seed until next year, when you will have this year's breaking to replot, and break all you can this spring, so as to have as large a crop of corn as possible, which will doubtless be found useful.

Book on Horses.—"A. B.," Cass Co., Iowa. The best work we know of upon the management of horses is "The Horse in the Stable and the Field," by Stonehenge; price \$3.50, at this office.

As to Patented Articles.—"G. B.," Oneida Co., N. Y. If patented articles have it not distinctly stamped or marked upon them that they are patented and the date of the patent, then the patentee must notify the one who infringes before he can enter a suit against him. The butter-tub you refer to may or may not be patented; we can not say as to that, but it is very certain that oaken butter-tubs, which are larger at one end than at the other, have been in use for many years back, and, unless there is something else about them which is novel, there can be no valid patent on such a tub. For all information about procuring patents apply to the patent department of this office.

Dog Power.—"L. B.," Oxford, Ohio. Among the really useful dog powers probably the best is one made on the plan of the common horse power; it is sold for \$25 and may be driven by a sheep or a calf.

Tallow Scraps.—"J. J. B.," Monroe Co., N. Y. Tallow scrap contains skin and more or less fat as it has been well or badly pressed. The fat is useless as manure, so that the skin is the only valuable part, and the value obviously depends upon the character of the scrap. For manure we should hesitate to pay \$20 a ton for it, but would do so to use it as food for hogs or poultry, for in this way the fat and digestible parts would be utilized, and the skin or indigestible parts would be in much more valuable condition for manure after passing through the animals.

"Bromophyte."—"C. H.," Bullitt Co., Ky. We do not know of what this fertilizer consists. Any fertilizer, the composition of which is kept secret, should be regarded with suspicion. We will not advertise or advise the use of any compound of this kind.

Delay in Replies.—If our correspondents, when writing for information along with other business, would remember our frequent request and place their remarks or queries upon a separate piece of paper from that on which they write about their other business, inclosing both in the same envelope, they would much facilitate the reply to their inquiries. Letters sometimes lie over a whole month for want of this precaution.

Contraction of the Hoof.—"J. H. D.," Stouts, Ohio. Contraction of the horn of the hoof is an effect and not a primary disease, and the lameness is a symptom of the obscure disease which causes the contraction. It may be caused by chronic founder or laminitis or by a diseased navicular bone, either of which is incurable. If it is not caused by the above it may result from bad shoeing and cutting away the frog, in which case a Goodenough shoe should be used and the frog in future be left entirely intact. Contraction of the hoof rarely or never occurs when the frog is allowed to come to the ground.

Government Help for Colonies.—Charles Stumm. The government gives no help in the shape of seed, implements, or passage money to homesteaders. It is enough that it gives a free homestead, upon which a man must work his own way to independence. We do not advise persons without means to go on to a homestead. They suffer hardships and disappointments, which are apt to disgust them with their position.

Frost Disturbing a Cellar Wall.—"B. R.," East Killingly, Ct. When the fall rains saturate the ground and the winter frosts follow, the wet ground in freezing expands greatly. This expansion pushes in the cellar wall, and as the north side is the coldest that side suffers most. The remedy is to have a drain to carry off the water from around the house, for when the soil is dry or nearly so frost has but little effect upon it.

Heat for a Compost.—"C. H.," Hillview, Ky. A compost heap of stable manure and leaves will heat up very rapidly and will soon be in danger of fire unless plentifully supplied with moisture or

turned over to reduce the fermentation. As a rule nothing but a loss is made by keeping manure piled up, so as to heat very rapidly. We would draw it out and spread it at once where it is to be used.

How Many Bundles of Oats to an Acre.—"T. A. M.," Owensboro, Ky. The number of bundles of oats there may be to an acre upon good land depends upon the size of the sheaves. The best crop we have raised, which is probably more than the average and of which on that account we kept a record, amounted to nearly 600 sheaves to the acre. The yield of grain was one bushel to a dozen sheaves. It was a large strawed variety with heavy grain, the seed of which was imported from Nova Scotia, and therefore might not be a fair test, but it is the only one that occurs to us.

Plaster upon Wheat.—"A. H.," Lithopolis, Ohio. We have seen no reason to believe that plaster has any benefit whatever upon wheat. Clover, corn, peas, potatoes, and perhaps oats are the only crops for which we have found it of service.

Preserving Posts.—"W. F. C.," Albany, N. Y., sends us a plan for preserving posts a receipt which has been widely published in both agricultural and scientific papers, the editors of which ought to have known better. It is to paint the posts with linseed oil in which powdered charcoal has been mixed. This is said to make them indestructible, but it can have no more effect than any other paint. The charcoal, being merely a surface application, can not prevent the decay which takes place in the interior of the post from natural causes, nor can it prevent moisture entering by way of the minute cracks which are found in the timber; and where moisture and change of temperature occur, decay takes place, unless there has been a chemical change in the wood by some active, penetrative agent.

The Gardeners' Monthly.—What is the matter with it? Has it changed editors, or what has happened? In the March number a correspondent asks the editor to tell him something about "Jerusalem artichokes." Whereupon, after mentioning the proper artichoke, some learned writer says: "Another artichoke is that called 'Jerusalem.' It is a sort of sunflower, and 'Jerusalem' in this case is nearly the sound in English of a French word which signifies sunflower." We always thought a knowledge of ancient and modern languages a good thing for an editor to have, and we are now more than ever convinced of it. The French names for this so-called artichoke are *Topinambour* and *Poire de terre*, and that for the sunflower in general is *soleil*. If any one can make these words sound like Jerusalem we have no doubt it is the learned friend of the G. M.; but we would suggest that he would meet with better success if he tried first on the Italian word for sunflower, *girasole*. The article continues: "We suppose it was called artichoke by mistake, by some one who did not know any better, and then sunflower had to be tacked on to distinguish it. This [what? having sunflowers tacked on?] happens even in this day to the best of us." A sad moral reflection, but behold how it is pointed and adorned: "The editors of *HEARTH AND HOME* and *American Agriculturist*, for instance, are among the most intelligent in the country, and are seldom caught asleep, but [so Jove sometimes nods] they did once figure and describe a plant, which is really *Talium patens variegatum*, as *Boussingaultia Lachauxii*. So, for distinction, we have to say Humboldt's *Boussingaultia* when we mean the real Madeira-vine, and Thurber's *Boussingaultia* when we speak of the other." There! if that does not make the whole Jerusalem artichoke business "as clear as mud in a wine-glass" then there is no virtue in illustrations. What interests us most in this remarkable illustration of the statement that editors, like common mortals, are liable to make mistakes or have sunflowers "tacked on to distinguish" them—we hardly know which—is the positive assertion that the editors of *HEARTH AND HOME* and *American Agriculturist* have "figured and described" a plant under a wrong name, and actually done this in the case of *Talium patens variegatum*—which they did figure and describe as *Boussingaultia Lachauxii*. As at the only time when this flagrant error is likely to have been imposed upon a deluded public *HEARTH AND HOME* was edited by Mr. Donald G. Mitchell, we leave him to excuse himself to the tribunal of the G. M. (not Great Mogul, but Gardeners' Monthly) as he best may. But for ourselves, the little we can say must be in extenuation, and in the humble hope of mitigation of sentence. A new plant was introduced for the beauty of its leaves alone. Now, we appeal to the Gardeners' Monthly if it is an un pardonable sin, and one to be remembered for years and to be brought up against the one who commits it in its own pages, where to be held up as a warning and terror to evildoers is better than to be praised elsewhere? Is he the

first botanist, or even the first editor, who ever made a mistake in naming a plant? If G. M. will admit this, then we will inform him that the editor of the *American Agriculturist* never, in that paper or anywhere else, did publish *Talina patens variegatum* as *Boussingaultia Lachaumii*. G. M. says we did. We are sorry to differ even so slightly with our friend, and to assert that we did not! G. M. is great for presenting theories, and as such they are often amusing and interesting as the outcomes of an active imagination, but we thought we could always depend upon its facts—but, alas! he says we did that which we did not. Do we accuse the editor of G. M. of willful misrepresentation? Not at all, for he would not be guilty of that. To show that "even the best of us" are sometimes "caught asleep," we will now tell our venerable friend what foundation he had for the charge which we are obliged to deny. At the full exhibition of the Pennsylvania Horticultural Society in 1869 there was exhibited a small variegated-leaved plant, with no flowers, though if we mistake not a few buds were visible; it was labelled "*Boussingaultia Lachaumii*." When we were making up the Horticultural Annual for 1870 Mr. Peter Henderson brought us the same plant to figure, and in his report upon the new plants of the year he had a notice of it. We do not now recollect under what name Mr. H. had it, but recognizing it as the plant we had seen at Philadelphia we were at once put upon our guard. Philadelphia is admirably correct in some things, but in names of plants she is loose unto prodigality; plants in the city are so frequently called "out of their names," that the bad example extends for many miles around. For instance, one florist on the Darby road calls an *Eulalia* an *Imperata*, a mistake no one who knows anything about the structure of grasses would make; and even from Germantown we have a catalogue in which the pretty *Festuca glauca* is disguised as *Agrostis glauca*, which, as both are grasses, is perhaps not so bad, but then we have *Astilbe Japonica* taken out of its natural family and called a *Spiraea*; and we might cite numerous other instances of the extent to which this bad example of Philadelphia had spread. In making up the Annual we thought best to be very cautious with the Philadelphia name of this plant, as our venerable friend will see if he turns to page 114 of the Horticultural Annual for 1870. He will there find: "*Boussingaultia*? var. *variegata*." Which means that it may be a variegated *Boussingaultia* and may not. We congratulate G. M. that, after the lapse of five years, he has been able to decide what the plant is; but regret that he should have endeavored to give prominence to his profound knowledge by using our object ignorance as a foil. We are not in favor of the "you're another" style of criticism, but as we had taken the editor of G. M. up on the *Centaurea Americana* question he was bound to hit back somehow, and chose a very unfortunate topic, lodged in by the ears, to a place where it is no more *apropos* than a quotation from the multiplication table. We do not consider these little vagaries of the editor as detracting from the general character of the Gardeners' Monthly, which perhaps needs an occasional blemish to make its real excellencies more conspicuous.

Lucern.—"G. T. W.," Wallfleet, Mass. Lucern requires a rich, dry soil, such as a warm gravelly loam with open subsoil. Sandy land is not suitable to it, unless it has a strong loamy open subsoil. This crop exists more upon the subsoil than the surface, after it has become established, but it can not be established with any profit upon any but a rich, mellow surface soil.

American Turf Register and Racing Calendar for 1873 contains a synopsis and reference record of the results of races in the United States and Canada during that year. Published by the Turf, Field, and Farm Association. Price \$3.00.

Improving Southern Fields.—"M. A. L.," Point Pleasant, Mo. To get a stand of grass we would suggest that you should plow and sow an early crop of cow peas, and when they are in blossom plow them under. Repeat with another crop, which plow under, and sow wheat with timothy in October next. This will be far better than a bare fallow, and the cost of the seed will be a very cheap price for the green manure plowed into the soil.

How to Feed a Colt.—"H. W. H." It is the early care of the colt which makes or mars the horse. The danger is generally in starving him rather than over feeding. The point to be aimed at is to keep him growing. He may be fed from two weeks old. At that time, in addition to the milk from the mare, he should have a handful—at first—of oatmeal or oats, soaked in sweet cow's milk or water. If the mare does not give much milk this may be gradually increased up to two quarts of oatmeal or oats in a few weeks. No corn should be given to a colt at any time, and all the

oats he will eat up clean and with an eager appetite may be given without danger. He should be brushed daily, so as to keep the skin clean and free from scurf. It is well to have a closed stall next to the mare for the colt, in which he may run loose when not at pasture.

Harrowing Wheat.—"T. F. H.," Sun River, Montana. We have never heard of any injury having been done to the young wheat by harrowing with the Thomas harrow; on the contrary the experience of those who have tried it is favorable. We have harrowed wheat with the common harrow even with very great benefit to the crop. We have also drawn a harrow, from necessity, across the corner of a field of young oats, and at the time supposed we had destroyed the plants, but the strip over which the harrow passed was afterwards much the best of the field.

Soap and Glue Refuse.—"A Subscriber," Kent Co., Mich. The refuse of glue or soap works is a valuable fertilizer. That from the glue works is the most valuable. What its actual money value is depends upon so many contingencies that what might be worth 10 dollars per ton in one place might not be worth more than one dollar elsewhere. We have paid \$2 per ton for glue refuse, a large portion of which was water. We found it very valuable as a dressing for grass lands or for vegetable gardens.

The best Hay Fork.—"T. A. J.," Ontario Co., N. Y. While persons' tastes differ as to implements, our experience is that the double harpoon hay fork is the best for hay, straw, or sheaf grain of any we have used. All these, whether long or short, may be unloaded with it, and manure may be loaded with it equal well. A neighbor, who is a large and intelligent farmer, last season unloaded his grain from over 150 acres with one of these forks in a most satisfactory manner.

Bed-Bugs.—"M. K. W.," Nashville, Tenn., writes that she does not care to have corrosive sublimate around on account of the children. Finding the children were bitten, she put their beds upon the floor, and here they were worse troubled than ever. The enemy was traced to an old lounge. This, as well as the cracks in the floor, had its joints thoroughly scalded with boiling brine. A few repetitions completed the job.

Ashes for Peach-Trees.—"Taylor." There is no better fertilizer for peach-trees than wood-ashes.

Buckwheat.—"W. B.," Templeton, Mass. There is no crop that responds more quickly to good soil and cultivation than buckwheat. It is called the "lazy man's crop," for the reason, that however badly it may be put in, there is always something to be gathered at harvest. For a good crop the soil should be well plowed; the seed may be sown upon the plowed ground and then harrowed in. A dressing of 20 bushels of lime or 100 pounds of plaster per acre is very beneficial to this crop. An excellent crop may be taken from a sod that is plowed early in July, after the hay has been taken off, which may be followed by corn or oats the next spring. One bushel of seed per acre is sufficient; on very good soil three pecks is enough.

Varnishing Chromos.—"Constant Reader." Mastic varnish, usually called picture varnish, is the kind used. If you have but one chromo that needs varnishing it will be cheaper to send it to some picture store than to buy varnish and a proper brush.

An Iron Dish-Cloth.—"Mr. George Smith, Farmerstown, Ohio, sends us an "iron dish-cloth," which is like a piece of chain-armor, and useful for scouring pots and other cooking utensils. Mr. S. says it has long been in use in his vicinity, but is not known generally. They have been kept by our furnishing stores these many years, but that does not make them any the less useful.

Insects on Roses.—"Franklin Street," Portland, Me. We can not tell you how to best fight insects unless we know what they are. You give no description, but only say, "an insect which eats off the tips of the buds when about half grown." This looks like the work of the rose-bug, a small drab-colored beetle. Nothing will do for this except hand picking. In early morning it may be readily shaken off, caught, and killed.

Dairy Business in the West.—"J. A. W.," Boston. There are many openings for the dairy business in the West. Many localities are able to furnish milk enough for a cheese factory, which would be

a home industry well worth encouraging. Either Iowa or Kansas would furnish many such localities if J. A. W. would go thither and seek them out. It is more than probable that a short notice in our advertising columns would elicit much information as to these places. \$3,000 would put up a factory such as is needed, and surplus capital might if desired be employed in keeping a stock of dairy cows in addition.

Primula Japonica.—"A. G. F.," Portland, Me. We think this will prove hardy, but we have had so few plants that we have not cared to try them.

Poetry.—"C. H. H.," sends us a poem which we must decline for two reasons: 1st, we do not publish any poetry that has appeared elsewhere; and 2d, we do not print poetry at all. So much verse was offered us, that several years ago we found it expedient to make a rule that we would publish nothing called by courtesy "poetry," and we have seen no reason to depart from it. Our old readers are aware of this, and we may do a service to some of our new friends by reminding them of it.

Monarch of the West Strawberry and Herstine Raspberry.—"Scott." Those who grow this strawberry on the light lands of southern New Jersey speak well of it; others who have tried it on heavy soil find it a poor variety. The Herstine Raspberry is in every respect superior as a fruit to the Philadelphia. The winters of '70, '72 and '73 injured it badly with us—but so it did other varieties counted hardy.

Utilizing Night-Soil.—"P. H. R.," Liberty Corner, N. J. In the *Agriculturist* of October, 1872, there is an article with illustrations entitled "How to Empty a Cesspool." In that will be found directions for preparing the contents for use. To use the preparation it is spread upon the surface of the soil, to be manured and harrowed in as near the seed as possible.

Horticultural Humbugs.—Lafayette & Co. appear no more, but their mantle has fallen upon shoulders quite worthy of it. A store up Broadway is now in full blast, and offers the same wonderful things, the merits of which are set forth in the same Gallo-Yankee language, and illustrated by as phenomenal drawings as were the worthless wares of Lafayette & Co. By way of curiosity we made a visit to the establishment, and heard and saw these horticultural marvels: Apricots weighing one pound each, plums without stones, raspberries with "large fruit as a egg of fowl," are among the choice things of the catalogue. These are as nothing compared to "*Fragaria Africana arborescens*," strawberry in tree, having a fruit similar to this of a herbaceous fruit, much larger, with the same perfume, a new kind." These are *grafted on quince* (!), considering which \$3 does not seem so very high for a plant. Then a grape, which is not here but is coming, bears bunches weighing fifteen pounds, and ripens in the open air in July. The asparagus, which can be cut in ninety days from the seed, is now sold at only two cents a seed, while Lafayette & Co. charged four cents. In the way of flowers, we can only mention pansies of unheard of shapes at twenty-five cents a seed; "*Gentiana Africana*," which is in blossom during nine months, and "*Calypso borealis* of China, remarkable by its dimension and its agreeable smell, in blossom during three months." The catalogue concludes with "*Fragaria arborescens Africana*"; whether it is different from the previously mentioned "*Fragaria Africana arborescens* we do not know, but presume it is as it "produces fruit weighing sometimes one-half kilog. (one pound), delicious, four varieties." This bold imposture is carried on every spring, sometimes under the name of Lafayette & Co., and sometimes under another name, but they all have similar things and similar machinery to aid them in disposing of them. Men of means and intelligence will go to these fellows and purchase stuff for which these preposterous claims are made, and we have little sympathy for such people when they get humbugged. It is with the amateurs with small means that these chaps do the most mischief. These, with a great love for flowers, but without knowledge enough to see that the representations made by these travelling dealers are simply impossible, will purchase the trash, and throw away for nothing a sum that would have given them much enjoyment if expended for good things. These fellows, with their impossible monsters, have some good-looking stock, such as roses, camellias, and the like, which give their place a respectable appearance. It is probably impossible to stop these swindlers by any legal means, as by the time a purchaser finds out the fraud they are far away, and next year another set (probably of the same gang) appear. We give the present set credit for one thing: they have left the "blue rose" out of this year's catalogue. No reader of the *Agriculturist* will, we trust, be taken in by any such

representations as those we have quoted. Remember that our own regular dealers have everything in the way of seeds, flowers, and fruits that is worth growing, and if a valuable new thing is offered in any part of the world, the contest with them is to see who shall introduce it soonest.

Petroleum for Priming.—"S. M. W.," Shippensburg, Pa., writes that "an experienced car-builder informs him that even the best mineral paints will not adhere to wood that has been oiled with petroleum some weeks before painting. His plan is to apply the crude petroleum as hot as possible, and put on the paint as soon as the petroleum has fairly cooled. Result much more satisfactory than when the petroleum is applied cold and the wood not painted for some weeks afterwards." This is quite probable. For hard wood the lighter oil will soak in more readily than the heavier oil, and the hotter it can be applied the more rapidly will it be absorbed. For pine or hemlock, except the weather is very cold, it is not necessary to heat the oil. Paint will not adhere well to the oiled surface unless the petroleum is absorbed by the wood. Last summer we put petroleum on to a new pine double wagon box. We went over the box two or three times at intervals of two or three days, or when we happened to think of it. We probably got on three or four gallons of oil. In two or three weeks afterwards we painted it with Averill paint and found no trouble. The paint adhered as well as could be wished. We put on two coats, and the box looks as smooth, glossy, and firm as if made of the best of hard wood. In cool weather, and especially with hard wood, it would undoubtedly be advantageous to apply the petroleum hot, for the simple reason that it would penetrate deeper into the wood. How long or how short a time elapses before the mineral paint is applied is of little consequence, provided the petroleum has been absorbed by the pores of the wood. This is the main point to be observed. [This comes from one of our associates who has had much experience in the use of petroleum, and as he passed much of his life in a chemical laboratory it does not occur to him that anything can be dangerous. So we must add that if petroleum is to be heated it must be done with the greatest caution or it will take fire. The safest way will be to set the can in a kettle of hot water out of doors, and be sure not to bring a lamp, light a match, or allow flame of any kind near the place where the work is going on.—Ed.]

Catalogues Received.

Last month we left out other matter for the sake of space to notice the catalogues of our friends, the dealers. We supposed that we had at hand the majority of the catalogues, and were willing, for once, to give a separate mention of each one with some notice of its peculiarities. Since then we have received a large number more, and though these are of the same importance as those mentioned last month, we can not, owing to the claims of others upon our space, give other than the briefest notice.

GENERAL NURSERY STOCK.

- J. W. ADAMS, box 1,340, Springfield, Mass.
 ORTO & ACHELIS, Westchester, Pa.—Large stock; wholesale and retail.
 A. HANCE & SON, Rumson Nurseries, Red Bank, N. J.—Also greenhouse plants.
 REISIG & HEXAMER, New Castle, Westchester Co.—Specialties, small fruits, particularly strawberries and seed potatoes.
 P. T. QUINN, Newark, N. J., besides pears offers small fruits and various vegetable plants.
 S. J. ALLIS, Erie, Pa.—Grapes and other small fruits.
 GREENHOUSE AND BEDDING PLANTS.
 GEORGE SUCH, South Amboy, N. J.—General collection with gladiolus as a specialty. The neatest catalogue yet seen from Europe or this country.
 S. B. VREELAND (Greenville), Jersey City, N. J.—General stock with the fine *Bouvardia Vreelandii* as a specialty.

- W. B. WOODRUFF, Westfield, N. J., besides greenhouse and bedding plants has a full list of vegetable plants, and still another new tomato—"Robert."
 JOHN SAUL, Washington, D. C.—A huge catalogue, embellished with a fine colored plate of the new "Ball of Snow" Abutilon.
 W. C. WILSON, Astoria, N. Y., and 43 West 14th street, N. Y.—An immense general assortment with a number of specialties not offered elsewhere.
 MILLER & SIEVERS, San Francisco, Cal.—A catalogue so full as this is a surprise to us, who knew San Francisco when there was not a florist west of the Rocky Mountains. Send your other catalogues.

DINGEE & CONARD Co., West Grove, Chester Co., Pa., make a specialty of roses, which they send by mail at very low prices. The catalogue is valuable for its sensible cultural directions.

P. J. BERCKMANS, Fruitland Nurseries, Augusta, Ga., is largely engaged in floriculture as well as the nursery business. Besides a general stock he has many things suited to Southern gardens only. Prices astonishingly low.

SIDNEY WILKINSON, Providence, R. I.—We are glad to see so fine and full a catalogue from a city which for one of its size has heretofore had very few florists.

OLM BROTHERS, Newark, N. J.—This large establishment always presents some novelties, and it has a number in this year's catalogue.

WM. J. HESSER, Plattsmouth, Nebraska.—A more complete list than one would expect to find in a place which but a few years ago was "on the frontier."

GREEN, BEECH & ARTER, South Oil City, Pa.—Send an illustrated catalogue of plants and seeds.

SEEDSMEN.

D. M. FERRY & Co., Detroit, Mich.—This is one of the largest seed-growing establishments in the country, and their descriptive catalogue is very full and complete.

JOHN SAUL, Washington, D. C., has, besides from his nursery, a seed store opposite the Patent Office.

SCHLEGEL, EVERETT & Co., Boston, Mass., have besides the usual list many peculiar and Boston—and therefore very good—"notions" in the way of vegetables and flowers.

J. M. THORBURN & Co., No. 15 John street, N. Y., publish each February a list of *Tree and Shrub Seeds*. Those who write asking where such things can be had should bear this in mind.

HOVEY & Co., Boston, Mass.—For nearly 40 years have this firm sent out each year their well filled catalogue, and yet they keep up with the times.

AARON LOW, Essex, Mass., grows garden and flower seeds, and his catalogue tells all about them.

JAMES FLEMING, 67 Nassau street, has a very full illustrated catalogue of vegetable and flower seeds, prefaced by a handsome colored plate of Double Zinnias.

VICK'S FLORAL GUIDE.—Mr. James Vick, of Rochester, extends his catalogue over the whole year and makes it a quarterly. No. 2 has many interesting items and a "pronouncing vocabulary of botanical names," which would be more useful if it were more correct. What can he mean by telling us that *coix* is pronounced "coy!" Other words also needs revising.

W. H. SPOONER, Boston, Mass., puts out his catalogue as a "Garden Guide," and a very creditable one it is.

CHARLES SIZER, Mount Lebanon, N. Y., sends out what he calls a Shaker Catalogue, which is in appearance very much like the catalogues sent out by the "world's people," and contains no intimation that it is issued by any Shaker community.

V. P. DOW & Co., Albany, N. Y.—Seeds, Rustic Work, Implements, etc.

IMPLEMENTS, FLOWER-POTS, ETC.

GARDENER B. WEEKS, Syracuse, N. Y.—Cheese and Butter Factory, and Dairy Supplies and Apparatus. Well illustrated.

A. H. HEWS, North Cambridge, Mass., have an illustrated catalogue of machine and hand made pots, etc.

SNOW & COOLIDGE, Wachsett Pottery, West Stirling, Mass., also send a catalogue of similar wares.

EUROPEAN CATALOGUES.

E. G. HENDERSON & SON, London, send an immense catalogue of seeds of all kinds, including all the new things.

ALEGATRIE, Lyons, who introduced the new double white and other double Pelargoniums last year, offers a new set, raised by Jean Sisley and others, and a new lot of Carnations.

Planting Trees upon Highways.

We have been requested to publish the law in regard to the money allowed for planting shade trees on the side of the roads in the State of New York. There was an act passed April 26, 1869, entitled, "An Act to Encourage the Planting of Shade Trees along the sides of the Public Highways" (chap. 322). This act was amended May 3d, 1870, so as to include fruit trees (chap. 595). We give the act as amended, and as it now stands:

"Section 1.—Any inhabitant liable to highway tax who shall transplant by the side of the public highway any forest shade trees or fruit trees of suitable size shall be allowed by the overseers of highways, in abatement of his highway tax, one dollar for every four trees set out;

but no row of elms shall be placed nearer than seventy feet; no row of maples or other forest trees nearer than fifty feet, except locust, which may be set thirty feet apart; fruit trees must also be set at least fifty feet apart; and no allowance, as before mentioned, shall be made unless such trees shall have been set out the year previous to the demand for said abatement of tax, and are living and well protected from animals at the time of such demand.

"Section 2.—Any trees planted by the side of the public highways as aforesaid, in the place of trees that have died, shall be allowed for in the same manner and in the same conditions as in the preceding section.

"Section 3.—No person shall be allowed an abatement of his highway taxes as aforesaid, more than one quarter of his annual highway tax, and no one shall receive any abatement of tax for trees planted previous to the passage of this act.

"Section 4.—This act shall take effect immediately."

The act has had very little effect. Not one farmer in a thousand knows of its passage. And those who know of the law seem to care little about it. The compensation is too small. A farmer of one hundred acres is assessed say from \$8 to \$12 highway tax to be "worked out." A man, team and plow, wagon or scraper, counts for three days' work, or \$3. So that if a farmer is assessed \$12 all he can get for setting out trees is one day's work for himself and team. If section 3 was stricken out, so that a farmer might be allowed 25 cents each for all the trees set out, it might have some effect. As it is, a farmer who has energy and sense enough to set out trees will not be influenced by the small compensation, and those who have not will pay little attention to the law.

Bee Notes.—Advice to Beginners.

BY M. QUINBY.

Mr. Smith, Pa., writes that "wild Sullendine plant is a perfect cure for bee stings, and mosquito bites." All that is necessary, he says, is to apply the juice immediately, to prevent swelling: He probably means common celandine, growing in wet places. At our association in Utica last February, a member brought what he called an antidote to bee stings, in liquid form. To convince the skeptical of its efficacy he actually brought some bees with him, and got himself stung in two places. To one place he applied the remedy, and the effect of the sting on that did not seem quite so bad as the other, to which nothing was applied. He urged all to make the trial, and found but one willing, but he claimed that he illustrated its efficacy by partial success, at least. Ever since I kept bees, new remedies for stings have been recommended as certain cures. For a long time, I took pains to test them; sometimes a sting would be hardly felt, at others it would be very severe, when both were treated with the same remedy. My impression is, that in cases where the effect is slight, the puncture is slight, but little poison infused, or the bee is not incensed to make the thrust with much vigor. This seems more probable than that we have found an antidote. It is long since I have used anything, and do just as well. I do not wish to deny their efficacy, or even discourage the trial of them; but I trust I shall be excused from implicit confidence, when I have failed in so many cases. Those who have realized that it is easier to avoid contracting various habits in any ease than it is to cure them, will find no exception to the rule, when applied to bees. In their treatment in this respect let the beginner experiment for himself, and scan everything closely; take nothing for granted till corroborated by his own observation, whether for or against the little pets. I hope no one will make the mistake of copying a blunder from me. I only wish that bee-keepers would adopt the directions given for treating bees kindly, and watch the result.

In regard to the charge of their being a nuisance, it does seem that much that is said is dictated by an unkind spirit, to say the least. It is nothing but justice to examine both sides. We want facts.

A. S. Fuller, in the New York Tribune, is credited with saying that "he is satisfied that in many localities these winged workers are a far greater nuisance than mosquitoes, or even sheep-killing dogs. Perhaps some grape growers may ask their neighbors to keep their bees at home, as they do the cattle, for there is certainly no difference in the moral or legal aspect of the two cases. Let every one keep as many bees as he or she likes, but if they do any damage to the neighbors' crops the owner should be held responsible."

The last sentence seems not very unreasonable, if we can only get at the real damage. I claim it is very small, if any. It is difficult to ascertain. The difference in the "aspect" of the two cases is at once apparent. When cattle trespass, it can be seen, proved, it is not difficult to substantiate facts. But with the bee, how is it? Mr. Fuller "is satisfied," and seems to think it proved. In court, witnesses must know; some are too easily satisfied. The prosecutor would lose his case if he had nothing stronger. To see what satisfies Mr. F. we may

follow him into the vineyard. He is examining his grapes, he finds a cluster of fair ones, with a hole through the upper side of some of them, and bees and hornets around most of them, if the day is warm enough, busily engaged sucking the juices. Here is proof that satisfies him that bees alone have spoiled his grapes. The same kind of proof would satisfy some, that when the larvæ of the flesh fly was found devouring the carcass of a putrid animal, that they were the cause of its death. The same kind of evidence has proved that the moth worm has destroyed bees, when they only completed the destruction that was inevitable from other causes. A negative can not often be proved. I can not say that bees never puncture grapes; but I can say that I am satisfied that they never do any more than the flesh fly kills the animal. I have 4 or 500 grape vines and other small fruits, as well as apples and pears, and a large apiary, all in one locality. I have no interest to bias me, and ought to be able to judge somewhat understandingly. If I was called to testify in such case, it would be of what I know. I have seen bees on grapes; sometimes two or three on one, when they had been punctured so as to expose the juices. I have watched them long and patiently, to see them attack sound fruit, and never yet saw one do it—and no man of veracity ever told me that he had. The last season I had several barrels of delicious pears. I have seen bees on them—a dozen on one—and other bees endeavoring to get a chance at the orifice already made; and this while the sound ones of the same variety remained on the trees untouched. But when one had fallen, and was bruised sufficiently to expose the juice, it was attacked without hesitation. The same with apples; as long as sound on the tree they were not molested; but when taken to the cider-mill—only a short distance from my bees—and ground into pomace, tens of thousands would sacrifice their lives in their eagerness for the juice.

Relative to grapes I would say that I have visited the vineyard early, long before a bee was stirring. Found grapes—three or four in a cluster sometimes—particularly Concord—with a narrow strip of skin peeled off—loose strip often left—the pulp fresh, and no juice gone, which would not have been the case if bees had been the cause. Yet the grape was as effectually spoiled for market as if the bees had sucked it dry. What did it do? If I make it clear that the bees did not, am I under any more obligation to trace it to the starting point than Mr. F. or any other man? Will Mr. F. watch the Robins a little closer, and see if some of the strange ones, on their way south, may not be tempted to peck through the skin of the grape as well as pear—perhaps only to find the grape unpalatable.—See "New trick of the Robin," page 103, last month's *Agriculturist*.—I want old bee-keepers as well as beginners, and those interested to look at these things, not to substantiate a preconceived opinion, but to get the facts, even if some notions are upset that appear to be well founded.

Feeling much regard for Mr. Fuller for what he has done in horticulture I should be pleased, if on investigation it should appear that what is attributed to him he has not said.

Many of our feathered songsters have been accused of destroying the farmer's crops by the unreflective, and have been slain by thousands, but investigation gave them credit for actually assisting the farmer, and a few have thought best to let them live and take the good they do to balance the evil. Will Mr. Fuller, or some one equally capable, just tell us if the bee does not help the farmer somewhat in aiding the fertilization of the fruit flowers, thus balancing some of the possible evils, and then, if he can establish the actual damage over the balancing benefits, the bee-keeper can choose between "taking care of his bees," or paying the amount assessed in dollars and cents. As the damage complained of never takes place in a season of honey, they can be kept from trespassing more cheaply than cattle.

Other complaints of damage have appeared, which I would like to examine some time, and see how close a man can come to proving a thing and not do it.

John Johnston.

The readers of the *American Agriculturist* will be pleased to see the portrait of that distinguished farmer, John Johnston, given on the first page of this number. The portrait is given without his knowledge, and we dared not ask him for any facts in regard to his life, for fear he might suspect our purpose. We must, therefore, confine our remarks to a few of the more prominent events of his career.

John Johnston was born in New-Galloway, Scotland, in the year 1791. Many of his early days—and nights also—were spent on the hills

tending his grandfather's flocks of sheep. "Whatever I know of farming," he once said to us, "I learned from my grandfather." And right nobly have these early lessons been reduced to practice throughout a long and eminently successful life. "Verily all the airth needs draining," was a remark of Grandfather Johnston in Scotland. We shall see how well the boy Johnston, some years later, in far distant America, applied the idea to practice on his recently purchased farm.

Mr. Johnston married in 1818, and came to this country in the spring of 1821. After looking about for a few months he selected and purchased a farm lying on the eastern shore of Seneca Lake, near Geneva, N. Y. The land lies on a high ridge, and a casual observer would not be likely to suspect that it needed draining. The soil is a rich, calcareous clay, but when he purchased was in a badly run-down condition. Mr. Johnston being poor had to run more or less in debt, and his neighbors predicted that he would soon be sold out. Here he commenced his life-work, and here he has lived for 52 years. "I have always been an anxious man," he once said to us, but his anxiety was of that kind which stimulated industry and quickened thought. He believed in hard work and good farming. He had his trials and discouragements like the rest of us, but when he stumbled he came up ahead. He had unbounded faith in himself. He was not afraid to run in debt for land or for the capital necessary to improve it. He did not believe in small farms. "I do not know how to manage a small farm," he once said to us. He was quite as capable of managing his farm of three or four hundred acres as one of fifty acres.

Mr. Johnston's leading crop has always been wheat. Everything else was secondary to this. But he has also made a good deal of money by fattening sheep and cattle in winter. "But," said he, "I never made anything by farming until I commenced to drain."

He commenced draining his land in 1835. He sent to Scotland for a pattern and got tiles made by hand. His neighbor, the lamented John Delafield, imported a machine for making tiles in 1848, and from that time Mr. Johnston laid tiles as rapidly as he could get the work done by the ordinary labor of the farm. "It cost me more," he once said to us, "than it would to have had the whole work done as Mr. Swan did it, at once, but I had to get the money from the crop on the drained field to pay for draining the second field." In fact, his draining paid for itself as it progressed. The extra yield of one crop of wheat frequently paid the whole expense of the draining; and in no instance did he fail to get all his money back in two crops. In 1851 he had laid sixteen miles of tile drain on his farm. In 1856, when we visited him again, he had between fifty-one and fifty-two miles of tile drains, and we believe nearly every tile had been laid with his own hands.

Underdraining was a new thing in those days. Some of the neighbors said, "John Johnston is gone crazy—he is burying *crookery* in the ground." But mark the result. When the so-called weevil, or midge, proved so destructive to the wheat of Western New York that nearly all the farmers thought they should have to abandon the crop; when on many farms the wheat would not yield ten bushels to the acre, we visited John Johnston (in 1856) and found he had sixty-two acres of wheat that almost bid defiance to the midge. He had that year twenty-five acres of Soule's wheat that averaged

83½ bushels per acre; and his red wheat was as stout as it could grow. In 1859 his crop of white wheat averaged over 41 bushels to the acre.

It would be an error, however, to attribute Mr. Johnston's success solely to underdraining. He has cultivated his land very thoroughly. He is a strenuous advocate for summer-fallows—plowing three, and occasionally four, times. He has made his land dry, clean, mellow, and rich. He grew great crops of clover for many years, dressing the fields liberally with plaster. After his land became rich he has grown timothy grass as well as clover, as he thinks he gets more and better hay. He has used lime with great benefit on his wheat. He has also used salt—a barrel per acre on his wheat—with remarkable results; he has sometimes used as much as seventy-five barrels of it in a year. He has also used more or less Peruvian guano. But in all his operations he has never lost sight of the manure heap in his barn yard. He has raised great crops of clover and fed it out on the farm. He does not plow it under. His corn, stalks, and straw, are all consumed on the farm, and for many years he bought tons and tons of oil-cake to feed with his straw. In this way he made great quantities of manure—and it was rich manure, not rotten straw. He piles his manure in the spring and uses it as a top-dressing on grass in the summer or autumn, the land being plowed up the next spring for corn.

Personally, John Johnston is tall and fine-looking, every inch a gentleman. He is temperate in all things. He neither drinks spirituous liquors nor uses tobacco in any form. A stranger seeing him in a select company would pick him out as a gentleman of the old school—perhaps a distinguished general or statesman. He would hardly suppose he was "nothing but a farmer"—that he had spent his life in a quiet farm-house; that he had followed the plow, dressed hundreds of sheep for foot-rot, and laid fifty miles of underdraining tiles with his own hands. And the stranger would be right. John Johnston is a distinguished man. He has led a most useful and honorable life. He has made money—and made it solely by farming, not by speculation. He has lived comfortably and brought up and educated a large family. His children, grandchildren, and great-grandchildren, delight to visit the old quiet home on the borders of the deep and beautiful lake. Here, too, many of our foremost farmers like to go, as on a pilgrimage, to pay their respects to the man whom they have learned to honor. Here, respected and loved by all who know him, may his life long be spared, as a grand specimen of an industrious, intelligent, true, and independent American farmer.

Ogden Farm Papers.—No. 50.

Since making up the statement of dairy results in the preceding article of this series, I have noticed a report on the same subject published by the Buffalo Live Stock Journal—to the effect that Mr. Cooper, of Wyoming Co., made an average per cow, in a herd of thirteen, of 4,928 lbs. (2,292 quarts) of milk. The net money proceeds averaged \$66.63 per cow—being 1³⁴/₁₀₀ cents per pound, or 2⁹⁰/₁₀₀ cents per quart. In addition to pasture he fed green oats and corn fodder. Mr. A. Tefft, of Chautauqua Co., with a herd of twelve cows, made an average of 7,245 lbs. (3,370 quarts) of milk. O. Brunson, Chautauqua, with seventeen cows, averaged 6,989 lbs. (3,250 quarts). A. P. Brunson, with twenty-four cows, averaged 6,163 lbs.

(2,866 quarts). At Mr. Cooper's price (2⁰⁰/₁₀₀ cents per quart) the others received, respectively, \$97.73, \$94.25, and \$83.11 per cow per year.

Per contra, the Country Gentleman published last autumn a series of very carefully prepared articles by E. Lewis Sturtevant, analysing the reports of over 300 butter and cheese factories in the State of New York, and of dairy farms to which the premiums of the New York State Agricultural Society have been awarded. In these articles it is demonstrated that:

1. "The average yield of the average cow of New York State can not exceed annually 1,350 quarts."

2. "The average yield of *superior dairies* will not exceed 1,800 quarts."

He concludes "that the annual yield of the native cow *in dairy regions* of America can be fairly estimated at 1,800 quarts a year."

Taking 2⁰⁰/₁₀₀ cents as the average price, we have \$39.15 for the average of New York State; \$52.20 for the average of the best dairies in that State; and \$37.70 as the average of the dairy regions of America.

Here is a difference between the average of the four cases reported in Chautauqua and Wyoming and the average of American dairies—\$37.70 per cow on one side and \$85.43 per cow on the other. The average of the good herd is *one hundred and twenty-seven per cent* better than the average of the whole.

The question naturally arises whether the better dairies cost 127 per cent more than the average, or whether any considerable part of this increase is profit. Remember that we are not considering the average cow of the whole country, including all the poor animals kept on poor forage by poor people, but the average in what are sufficiently large herds to be considered as dairies, and where the sale of dairy products is an important item of the farmer's business; this being, presumably, much above the average of all, if we include the poorer cows kept by the poorer people, and in those regions, especially in some parts of the South, where there is nothing worthy of the name of dairying carried on.

We shall certainly be within the mark if we say that the keep of a common cow generally requires, on average farms, for pasture and hay the year through, not less than six acres of land; so that the product of \$37.70 gives a gross return of \$6.28 per acre. Out of this must come interest, insurance, and depreciation on one-sixth of the value of the cow, the same on her proportion of the farm buildings and implements needed for the business of dairying, the maintenance of wagons and horses needed for marketing, and all the labor of hay-making, driving to and from pasture, feeding, watering, milking, and the care of utensils. The income from twelve cows would be \$452.40. How much of this would be left for clear profit after all the foregoing deductions were made, and after paying interest on the value of 72 acres of land, any farmer can figure out for himself. If he gets more than a meager subsistence in return for his slavish work he will probably find on examination that it comes from some other item than the dairy.

It may seem anomalous, but if it is fair to allow six acres per cow in an average dairy, it is fair to allow four acres per cow in the superior dairy. In the first case I allow three acres for pasture and three acres for hay (2½ tons); in the second I allow two acres for pasture, 1½ acre for hay (two tons), and half an

acre for corn (grain, stalks, and green fodder) and a few roots. The secret of this difference is that better cows imply better farmers, and better farmers imply better land, for improvement in farming is literally a "double back-action" affair. Good feeding reacts on the more copiously manured land, which responds with better supplies of food, and both of these stimulate the farmer to the general bettering of his farm and furnish him the means for it. A good farm in the hands of the right sort of man is like a swelling river in a limited channel: it is always growing out of its bounds, getting bigger and bigger, and demanding more and more capacity for its rising tide—just as a poor farm in the hands of a dullard is like a stagnant pool, which the rains of heaven are barely able to keep from drying up altogether.

Seventy-two acres of well farmed land of the same *original* character as that considered above will carry eighteen cows as readily as that would carry twelve cows. These, at an average income of \$85.43, will yield a gross return of \$21.36 per acre, instead of \$6.28, and for the 72 acres \$1,537.74 instead of \$452.40. The interest on the cost of the land will be the same; on stock, buildings, and implements more, of course, but we may leave an ample allowance for this without nearly equalizing the incomes. The labor will not be very much more except for milking, for the labor of cultivating the half acre will not greatly exceed the cost of harvesting and renewing the extra amount of mowing land of the poorer farm, and it will be more than compensated for by the extra profit from the incidental items of the better farming.

Such estimates as the foregoing are not sufficiently well grounded to be made minute and exact; but no one competent to form an opinion would hesitate to say that after all expenses are paid the inferior of the foregoing examples would result in a tight squeeze to make both ends meet, while the other would show a handsome and yearly increasing profit.

In the better cases cited (Chautauqua and Wyoming) the cows were only well selected natives, and the result might be materially increased by the use of thorough-bred or even grade Ayshire or Dutch cows. In Mr. Tefft's case the result was largely due to the fact that he feeds his skimmed milk to his cows, mixing ground feed with it (bran and corn and oats). In reply to my question on the subject, he says that this has long been his practice, and that the whole product of skimmed milk may be fed back to the cows yielding it, with excellent results in product and in health. Having had no abortions in his herd, he ascribes his immunity (as is usual) to his manner of treatment.

I have previously referred to the subject of coloring butter, and during the past five years have experimented with nearly every recipe that has come to my notice. I have now settled on a system which is so satisfactory—after nearly three winters' application of it in the coloring of over 3,000 lbs. of butter—that it is worth while to state it somewhat in detail. The question whether butter ought to be colored at all is one that may be left to the judgment of the maker. It is quite certain that butter of a good color sells for a better price than that which is as white as winter butter almost invariably is. I do not find that my customers object to artificial coloring, and I am sure they would criticize an uncolored article. No one objects to coloring with carrot juice,

which is unreliable in the matter of taste, and grows more and more so as the spring approaches; but annatto is sometimes looked upon as a "drug," and many hesitate to use it on this account. The annatto plant, which grows in the tropics, bears a prickly pod about the size of a horse-chestnut. In this are many seeds, of about the size and shape of kernels of buckwheat, which are imbedded in a reddish pulp. When the pod ripens the pulp dries and adheres to the seeds. This pulp, removed from the seeds, is the annatto of commerce. The common means of preparation is by steeping in water and boiling to a paste and then drying; this is "basket annatto." Recently, Mr. G. de Cordova has developed a process for removing the pulp from the seeds by washing in cold water, separating the coloring matter from the liquid and drying it without the application of heat, and then pulverizing it, securing the coloring principle pure and of full strength. This is called "annattoine," and is the substance that we use, the form being not different from that in which it exists in the native pulp, which is used by the people of Brazil as a flavoring matter in cooking much as we use salt, and which is as much an article of food and as little a "drug" as is carrot juice. Annattoine is a natural vegetable product, artificially separated from its natural combination without being changed in character, and may be regarded as wholesome and even nutritious. It may be used in several ways. That which we have adopted (and which costs about 10 cents per 100 lbs. butter) is according to the recipe of Messrs. Whitman and Burrell, of Little Falls, N. Y., who are large dealers in the material. I first got their recipe from Willard's Dairy Husbandry, and afterwards in an improved form from themselves. It is as follows: 1. Dissolve one pound of the best potash and one half pound sal-soda in ten quarts water, stirring occasionally, and allowing it to stand until well dissolved and until the impurities have all settled to the bottom of the vessel. Pour off all the clear liquor possible, let it settle again and pour off more, and repeat until only the sediment remains. 2. Dissolve one pound annattoine in eight quarts clear cold water, and let it stand in a cool place from one to two days until perfectly dissolved, stirring occasionally and thoroughly. This mixture will ferment if too warm. 3. Mix the two liquids together and let the compound stand until the annattoine is perfectly united with the alkali and the liquid becomes clear, stirring occasionally. 4. Store in earthen jars, or if in glass keep in a dark place. 5. Immediately before churning shake the bottle and put into the cream a large table-spoonful of the liquid for each gallon of cream, and stir it at once. More or less may be used, according to the depth of color desired—more for butter to be sold fresh than for that which is to be salted down, as the tint becomes stronger with time.

I have received a long letter which I condense as follows. (It is evidently written under the erroneous impression that we—O. F.—own the *American Agriculturist*. I wish we did.) 1. Why have you discontinued the use of cooked food for neat stock? 2. How can I keep my stable from freezing? It is made of matched rough boards, but there are some cracks. Shall I cover with paper, then with clapboards, and board up inside the joists and fill in with sawdust? Would it be desirable to make the stable warm, and what would it cost? 3. Would paper be better or cheaper than plas-

tering to keep frost out of a cellar? 4. Is not the white or light color of Jerseys and other cattle caused by long-continued delicate keeping and sheltering? 5. Why do you keep a farm? To enable you to run your printing business? How much have you made by tilling the earth? One of my late neighbors left property valued at \$75,000, accumulated by farming and perhaps by the enhanced value of real estate. He would have nothing to do with

than that of Lombardy, where the cattle are uniformly without white. On the other hand, the wild Chillingham cattle of England (now domesticated) are white, and so are Polar bears. 5. Perhaps for the fun of the thing; perhaps to have something to write about; perhaps with a view to money making—and probably with an eye to all three. The farm has no connection with the paper, except as a subject. The amount of our income from farming has

attachment which may be fitted to any plow whatever, by the use of which a great improvement may be made in plowing either sod or stubble land. The attachment, with its method of working, is shown in the accompanying engravings. It consists of a blade of steel similar to a round-pointed shovel attached by means of a shank to a jointed and curved arm. The arm is bolted to the plow by the bolts which fasten the mold-board to the handle. The attach-

Fig. 1.—DONNELLY'S ATTACHMENT TO PLOWS.

agricultural societies or papers. 6. For twenty years I have never lost a cow or calf by sickness and death, or had a single hour's sickness among them. Two years ago I followed your advice, and milked my best cow up to the time of calving. She became so reduced that she could not hold her supremacy, and lost her calf. I think a cow will give as much milk in a year or in a lifetime with two months or more rest as with less. 7. I think I could so take care of any herd as to prevent abortion or any other kind of sickness. If the system becomes reduced the animal is sure to suffer from disease. We should keep our animals "happy."

To which I reply: 1. We have suspended the cooking of food only because we had no corn fodder to speak of (we did steam so long as that lasted), and because our early cut hay is so good steaming would probably not help it much. 2. It will suffice probably to clapboard the outside of the barn (without paper) and to board up on the inside with matched boards (without filling with sawdust) unless the stable is very large for the stock kept. Bank around the base-board and foundation with leaves, or else plaster so well about and over the under pinning that no wind can blow in. It is very desirable to make the stable warm and to allow sufficient ventilation without having anything of the nature of draughts in the air of the stable. Any builder in your neighborhood can tell you what it will cost. 3. Plastering might cost a little more than paper, but it would be much better, and you can better stop the leaks about the sill timbers. 4. It is hard to say what is the origin of the white in cattle, but there seems no reason for attributing it to delicate keep. Jerseys are not delicately kept at home. They are tethered out nearly all winter, and endure much rain and raw wind. The climate is much softer than with us, but much colder

not been publicly stated. Your neighbor's case may be a good example of the value of neglecting the usual means for acquiring knowledge of one's business—or it may not. How much of his property was due to "the enhanced value of real estate," and how much to interest on money that would have been better invested in giving himself and his family a better education and a better life, would have much to do with the matter. 6. You have been careful, skillful, and lucky, and are to be congratulated. Few farmers have had such success, and those who have are more often they who have seven cows than they who have more. I do not now remember what I wrote two years ago about milking up to the time of calving, except that I favored it; but my subsequent experience has led me to think that it is best to allow cows to go dry one month when possible (with Jerseys it is not always possible). But I think this ample, and the harder work it is to dry them off the better I like them. 7. I think you would find yourself mistaken. Abortion (as an epidemic) is not preventible by any means now known. It comes like a thief in the night, and attacks old and young, strong and weak alike, and without the least apparent cause. Fortunately, it goes as mysteriously as it came, and it has gone from Ogden Farm. You hit the nail on the very head when you say that cows should be kept "happy." If there is a secret of success it lies in that.

An Improvement in Plows.

We have recently had an opportunity of testing an improvement in plows, or rather an

ment is shown in detail at the right hand upper corner of figure 1. Beneath, it is shown in operation. Being attached to the right hand plow handle, it is set into the proper position for work by means of the thumb-screw and nut, shown at *a* and *b*. When so set, and the plow is put in motion, the attachment acts as a sort of scraper, which scoops out of the newly-turned furrow slice, a groove, the earth from which is scattered upon the sole of the furrow. This is shown at *c* in figure 2, where the earth removed from the furrow slice, leaving a groove at the right of the letter *c*, is seen scattered at the left in the furrow. The effect of this is to make a mellow bed of earth, upon which the inverted sod or earth falls, leaving no vacant spaces into which seed may fall and be lost, and causing the sod, by close contact with this loose soil, to rot perfectly and not throw up a new growth of grass in each furrow, as it often does with our ordinary plowing. The surface of the plowed soil is therefore left in furrows and ridges, closely packed with mellow earth in the bottom of each furrow.

The advantages of using this improvement are many. In planting potatoes the seed may be dropped in the furrow immediately after the plow, upon the mellow soil left by the scraper. The next furrow falls upon the seed, the sod and earth covering it. If the ground is manured the manure falls upon the seed in the best possible position. After the field is plowed and planted a stroke with the back of a harrow, given after a few days, levels the surface, killing the weeds which may have germinated, and covering the seed to a depth of about three inches. If oats are to be sown upon a manured stubble, the seed, as the soil is inverted, falls upon the mellowed earth in the furrow and remains covered with the manure. If fall wheat is to be plowed in the same thing occurs, but the surface is left in a succession of ridges which offer the greatest protection to the plants against winter-killing and heaving out by the frost. In both these cases a great saving of labor is made, because one plowing finishes the whole work and no harrowing is needed.

Fig. 2.—MANNER OF OPERATION OF PLOW ATTACHMENT.

Fodder corn may be planted in the same manner as potatoes by dropping the seed in the furrow. Many other advantages will be obvious to the plowman who realizes the necessity of having the seed and soil come together in the best possible manner. The implement is known as "Donnelly's attachment" to the plow.

Oxford-Down Sheep.

The engraving here given is a copy of a photograph from life of an Oxford-Down ram. He is a three shearling, bred by Mr. Charles Howard, of Bedford, England, and was exhibited at two of the chief agricultural fairs in England, at both of which he was highly commended. The flock to which he belongs has taken no less than 72 prizes at different fairs since 1849, and being selected as a type of such an excellent flock, this ram may be accepted as a model of what this breed of sheep should be. The Oxfordshire Downs date from 1833. They sprang from a cross of the Hampshire and the South-Down ewes with Cotswold rams. By judicious selection a satisfactory result has been attained in producing a breed excelling in the desirable points of producing a good fleece of valuable wool, superior quality of mutton, hardiness of constitution, and uniformity of character—all points of the greatest value in a breed of sheep. From the flock of Mr. Howard sheep have been sent to Australia, Portugal, Spain, France, Germany, Austria, Russia, Sweden, Holland, and Belgium. Each year, in July, the rams are sold at public sale, and the price has steadily advanced since 1865, when these auction sales commenced.

Spring Management of Lambs.

The critical time with young animals is at their weaning. The change of food is so complete that if it is suddenly made mischief can not fail being done. This is particularly true as to lambs, and upon the proper treatment before weaning them greatly depends their future constitution; if indeed they escape with life the many dangers incident to lambhood. As a general rule it is best to begin weaning a lamb as soon as it is a month old, or as soon as it can be tempted to eat. Before the ewes are turned out to pasture a separate inclosure should be made, to which the lambs alone can gain access, and in which some tempting and nutritious food is provided. This may be made adjoining the yard where the ewes are fed. There a small trough, several feet long, resting upon the ground, should be placed, in which a few handfuls of bran or oatmeal sweetened with sugar should be scattered. This has been our own practice

in hastening early lambs for market, and a two weeks' old lamb would learn to nibble its share along with the rest. Afterwards, when the ewes come to be turned into the field, the practice should not be discontinued, but, if possible, some arrangement should

the gate consists of an upright roller, which, as the lamb squeezes through, turns and prevents the animal from injuring itself or from tearing its wool. The gates are pivoted, as before stated, at the middle of the upper and lower bars, but on the outside of the fence. Thus when

AN ENGLISH LAMB CREEP.

be made by which the lambs may have the run of a good piece of grass or clover along-side of the field in which the ewes pasture. We have generally arranged this by making small gaps in the fence, through which the lambs may creep when they are disposed. These gaps they soon discover and make use of, very early learning the natural trick of trespassing where they think they ought not to go. The best method of making a "creep" for the lambs, either in the yard or the field, that we have seen, is one shown in the accompanying engraving. It may be attached to any fence or

light stakes into the ground and wattling light brush-wood amongst them. The stakes may be driven about four to six feet apart and the fence made four and a half feet high. A very useful portable fence for sheep may be made in this manner by weaving it in separate lengths of about 10 feet. Each length should be fastened to the next one by withes, and to a stake driven into the ground at the point of junction; another stake should be driven at the middle of each hurdle to strengthen the fence. If made of stuff from one half to one inch thick, a very substantial

OXFORD-DOWN RAM.

hurdle. It consists of a small double gate, or two single half gates, pivoted at the middle of the upper and lower bars to an opening made in the fence, in such a way as to afford room for a lamb to pass outwards without opening the gates. The inner extremity of each half of

but yet light hurdle may be had, which will last many years with care, and which, where the material is readily procured, will cost nothing but the labor, and as this can be well spared at some seasons of the year, the cost will be practically nothing. We have seen such hurdles made of the low birch and alder brush, which abound in swampy places, that answered every purpose of a costly fence. To make the hurdles of such timber the stems of the brush should be cut into lengths of four feet and a half or five feet, and closely trimmed of all the branches. A scantling the length of the hurdle required is procured and holes are bored three or four feet apart. The stakes or stems are put into the holes standing upright, and the branches can then be woven between them very easily. The small twigs should be woven in along with the larger ones.

Walks and Talks on the Farm.—No. 124.

"R. F. W.," of Chester Co., Pa., writes: "A year ago last spring I sowed oats and peas, and raised about half as many more as I sowed. Last spring I tried it again, and the peas were an entire failure. We don't care about trying them any more."

Probably the conditions were not favorable. The land must be very rich, dry, and mellow, and the crop sown early. There is, of course, nothing to be gained by sowing two crops on the same land if the land is not rich enough to produce one crop. If you think the land too rich for oats, sow peas and oats together and you will stand a chance of getting a great crop. This is all there is to it.

"We also tried," continues Mr. W., "white mustard and rape. Plowed the ground in the spring and again in July. Sowed both mustard and rape July 21st. The field is rather poor—too poor for a good crop of corn. The mustard attained a growth of three to four feet. The rape made considerable growth but did not bloom. [It ought not.] Both were pastured with sheep, which eat the rape to the ground. The mustard was not eaten so well. But it was too old when turned into."

The mustard should have been fed off in September and October. The rape should have been reserved for feeding late in the fall and winter. Frost will kill the mustard, but does not hurt the rape.

"We have an oat-stubble field," continues Mr. W., "which we have been thinking of sowing to mustard in April or May; then pasturing the crop with sheep and sowing the land to wheat in the fall. Will it pay?"

The difficulty will be in its ripening up so fast that it can not be eaten off before it forms seed. It ought to be sown at different times, say a week or ten days apart. But in this case it will be necessary to have hurdles or some kind of portable fence to prevent the sheep from running over the whole field at once.

"It is the prevailing opinion in this section," says Mr. W., "that 40 or 50 ewes are as many as can be kept together to advantage. We undertook to prove the contrary, and last fall increased our flock to 113, of which five died early in the season, and of late seven have lost their lambs by premature birth. Can you tell the cause or suggest a remedy? The sheep have been fed corn, corn fodder, and clover hay, and have been kept in the yard except that they go out to water every day."

Perhaps they were kept too closely confined in the yard, or crowded each other in rushing through the door or gate when watered or fed, or perhaps the corn fodder or hay was moldy, or you feed too much salt at a time. Mr. W. does not say what breed of sheep he keeps. There is a general impression in this country that the long-wooled and other English breeds of sheep can not be kept in large flocks. The improved breeds of sheep, which mature early and fatten rapidly, will not stand neglect as well as the slow-maturing breeds. Texan cattle will stand long walks and short commons better than a Shorthorn.

We have yet a good deal to learn in regard to the management of long-wooled sheep. We can adopt English practices only in part. We must think and plan for ourselves. We must study our climate and the demands of the market. We can raise long-wooled sheep just as well as they can in Canada. We can produce all the long wool that our manufacturers re-

quire. We can supply our markets with good mutton. But how best to do all this is an open question. It is far from settled. I think it will be done by grading up our common sheep.

"C. W. H.," who has a large farm near Columbus, Ohio, asks me several questions. He has an apple orchard, in which the trees are fifteen years old. They stand in a blue-grass sod, very stiff, not having been pastured or mown for several years. "The canker-worm," he says, "is very bad in this section, and has been for several years. My orchard escaped until last season, when it had a few on it. Had I better plow the sod or had I better turn the hogs in it?"

Do both. Plow it very shallow early in the spring or late in the fall. The sod will rot and enrich the trees. The canker-worm can be held in check by scraping off all the rough bark and then taking strips of brown paper three or four inches wide and pasting them tight round the trunk of the tree. Then smear these bands with tar or printer's ink and see that the tar or ink is kept constantly fresh and sticky. Plowing the orchard and turning in the hogs will not kill the canker-worms. I would turn in the hogs to eat up the fallen fruit, and thus check the spread of the codling-moth which produces the worm in the fruit.

The codling-moth is becoming a terrible pest. I hold them so far in check in my orchard by pasturing it with sheep. In the garden I have over fifty varieties of dwarf apples. They are very fine, thrifty trees, and bear well; but the codling-moth leaves me very little perfect fruit. I have also on one side of the garden seven Northern Spy trees set out at the same time as my main orchard. The latter last season produced from two to five barrels to a tree. All the good apples I saved last year from the seven trees in the garden were put in one barrel. The rest were wormy. My old orchard, which has been set out forty years or more, has always been used as a hog pasture, and the apples are entirely free from the codling-moth.

The Judge has an old orchard of about two hundred trees, from which in four years he got more money than he paid for his whole farm of 75 acres. Three years ago, thinking to improve it still more, he plowed it up the last of May or first of June and sowed it to peas. He thinks the plowing checked the growth and productiveness of the trees. I think the orchard will get over it in a year or two; but it seems reasonable to suppose that cutting off the roots while the trees are in full leaf must be a serious check to them. The plowing should either be done so shallow as not to cut the roots, or done while the trees are comparatively dormant—in the fall or early spring.

From what the editor of the *Agriculturist* said about the barrel of Northern Spies I sent him I was afraid we had not pressed them tight enough in the barrels. And so the last time I was in New York I went to the firm who bought my crop. They did not know me. One of the young men asked me if I wanted to buy some apples. I told him I would like to look at some Northern Spies. He opened a barrel, and asked me \$4.50 for it. "Have you nothing better?" I asked, and he opened another barrel. "These are small," I said. "I want to see the best barrel you have. These are not as good as those I am now eating." He called another young man, and they whispered together a moment. "Not that," said the new comer, "open that barrel," pointing to a barrel that

had my name on it. On opening the barrel it proved to be in perfect condition—just as handsome as when put up in the orchard. "How much do you want for these?" I asked. "Six dollars," he replied. "Six dollars!" I exclaimed angrily, "why, you only ask \$4.50 for the others; why do you ask six for these?" "These," said he, "are the choicest Northern Spies ever put in a barrel. They were grown"—and here he looked at the head of the barrel to refresh his memory—"they were grown by Harris, of Rochester."

"Did you tell him who you were?" asked the Deacon.

No. I told him I would call again—and I will the next time I am in New York, as I want to learn all I can as to the best method of packing and handling the fruit.

In the market report of the last number of the "Chamber of Agriculture Journal and Farmers' Chronicle," published in London, it says: "Barley: all qualities have been very strong everywhere. Some 10,000 quarters [80,000 bushels] have been bought in London this week for shipment to America, consisting partly of French and partly of Danubian. It is not known whether this demand from America will continue." Our brewers and maltsters have themselves principally to blame for the present high price of barley. We can raise in this country all the barley that is required, provided we could be sure of fair prices. But the maltsters are as selfish and short-sighted as other people. When they get control of the market they force prices far below the cost of production, and the farmers stop raising barley. In 1850, I raised 30 acres of barley and sold it in Rochester for 37½ cents per bushel. In 1852 it was worth 70 cents. Since then there has been a greater advance in the average price of barley than in wheat, oats, and corn. But the fluctuations in prices have been very discouraging. I find in looking over the New York market reports in the *Agriculturist* that the highest quotation for barley in December of the different years is as follows:

1856, \$1.30 per bushel; 1857, 80c.; 1858, 92½c.; 1859, 88c.; 1860, 82c.; 1861, 87½c.; 1862, \$1.45; 1863, \$1.55; 1864, \$2.00; 1865, \$1.15; 1866, \$1.20; 1867, \$1.90; 1868, \$2.30; 1869, \$1.30; 1870, \$1.12; 1871, \$1.25; 1872, \$1.16; 1873, \$1.80.

In 1870 I fed out to my sheep and pigs 800 bushels of barley, which would now sell for \$1,500 or \$2,000. And so we go. And so we shall continue to go.

"Well, what are you going to do about it?" asks the Deacon.

If you are a barley grower stick to it year after year. If not, do not rush into it when the price is high only to quit it in a year or two. The truth is, only the best farmers should try to grow barley. The crop is a profitable one if you average 40 bushels per acre, but to do this you require better land and better cultivation than one farmer in ten is likely to give it. Unless your land is just right you will make more money raising oats than barley.

"Or oats and peas," says the Deacon.

Yes; but I have made up my mind not to say anything more about oats and peas. I get letters by the dozen about this mixed crop, and so does the *Agriculturist*, some of which they answer themselves and some they send to me. Here is one just received from southern Ohio. The writer wants to raise them for cow feed. "Will they succeed?" he asks. I do not know.

If peas do well and if oats do well, the two sown together on rich land will be likely to give a good crop. The probabilities are that he will do better by growing corn or by growing oats alone. "Where can I get the seed?" I buy mine in Buffalo. The peas are brought from Canada, and can be bought at from \$1.25 to \$1.50 per bushel. "How much per acre?" Sow 1½ bushel of oats and 1½ bushel of peas, or 2½ bushels of oats and 1 bushel of peas. I sowed thicker than this last year, but I do not think there is much advantage in it. Sow as early as the land can be got into good condition. It is better to drill in the seed. See that the oats and peas are well mixed and that they do not separate in the hopper. I cut my crop with a Johnston reaper. Thrash with a machine. A good fanning-mill will blow out the oats from the peas so that they can be fed separately if desired. The straw makes excellent fodder for horses and sheep. The cows will eat it, but they will give more milk on well cured corn-stalks.

This same writer says: "I like 'Walks and Talks,' but there are some things that we Western folks can not put in practice. For instance, you say petroleum is cheap and plenty. We don't get it at all here except in the refined state."—I had just the same trouble here. The gentleman who some years ago patented the use of petroleum for preserving wood sent me a "farm right" as a present. And so I thought I would try it. I went to Rochester to get a barrel. But it was not to be found. The dealers in oils and paints evidently thought I was a verdant man from the country, and offered me "rock oil" that they kept for lubricating purposes, telling me that I should soon be tired of painting with such stuff. I had to come home without my petroleum, and it was several months before I succeeded in getting a barrel of the kind I wanted. Since then I have used a good many barrels of it, and have now no trouble in getting all I want. And it will be so with my friend in Ohio. I speak of using crude carbolic acid, and I buy it by the barrel; but I suppose there are thousands of readers of the *Agriculturist* who can not find it at the stores. But I ought not to be blamed for this. When there is a demand for it the dealers will keep a supply on hand.

"It is just as I told you, Deacon. We farmers are going to have better times."

"You would not say so," he replies, "if you knew how hard it is to collect money. I tell you, farmers are poor."

"I know that very well—I am a farmer myself. But look at the situation. Potatoes here on the farm \$1 per bushel; white wheat, \$2; butter, 40c. per pound—and anything but gilt-edged Jersey at that; hay \$25 per ton, and straw \$12; barley for seed, about whatever you like to ask for it. I suppose you could get \$2.40 per bushel of 48 lbs. for choice four-rowed for seed, which is \$100 per ton. I have raised 1½ ton per acre, and can do it again."

"Still, I tell you farmers are poor."

"I know it, Deacon; I am poor myself. But there is a good chance for good farmers who have got their land in good condition. There is no money in poor farming—never has been and never will be."

"G. W. C.," of Ashley, Ill., writes that many pigs are dying in that neighborhood. I have had no experience with such diseases. I think

if the so-called hog cholera should break out in my herd I should separate all that were sick and put them in a dry, warm pen and keep them as quiet as possible, and give them the most nutritious and stimulating food and drink I could procure. If I lived near a slaughter-house I would give them fresh blood. Or I would kill a few sheep or a steer and cut up the carcass into mince-meat and boil it for a few hours, and give the pigs some beef-tea or mutton broth mixed with cooked corn-meal or oat-meal gruel or any easily digested and nutritious food. A little whiskey might also be given to stimulate digestion.

Some people seem to think that the reason why we have so much hog cholera is owing to the introduction of improved breeds of pigs. I think it is precisely the other way. What do we mean by an improved breed of pigs? Usually we mean a breed that has fine bone and little offal. A breed that is very quiet and that will turn the food it eats into flesh and fat. It is a breed that will eat and digest a stomachful of rich food and assimilate it. As a rule, the weak spot in all high-bred pigs is that their digestive powers are not as good as their assimilating powers. They can assimilate more food than they can digest. On the other hand, our common, coarse, unimproved hogs can usually eat and digest more food than they can assimilate. They are accustomed to forage for themselves. They have plenty of exercise and comparatively little food. Now then, if you take such a breed of hogs and endeavor to push them forward rapidly with rich food, it is easy to see how their blood could be poisoned by the excess of material which the animal is not able to convert into flesh and fat.

"Your remedy, then," says the Deacon, "is not to feed so high."

Rather, my remedy would be to raise a better class of pigs. I would raise such pigs as would stand high feeding until they were fat enough to go to market, and then I would dispose of them without delay. If you take pigs that are not accustomed to mature before they are three or four years old, and endeavor to so feed and force them that they shall be fit for market at twelve months old or less, what can you expect but hog cholera? On the other hand, a breed that is accustomed, and has been for generations, to mature early can be pushed forward rapidly without injury. I should expect the best success from pigs raised from a large, healthy, common sow sired by a highly refined, thorough-bred boar of a breed distinguished for its gentleness, fineness of bone, little offal, early maturity, and fattening qualities. The mother would furnish the digestive powers and the sire the assimilating powers. These qualities combined with early maturity, fineness of bone, and high quality of meat would give you precisely what a good feeder wants.

Mr. C. also says: "I see some calculations in regard to corn grown by John Johnston. It is good; but we farmers in Egypt [southern Illinois] do not profess to be thorough tillers of the soil, and yet I raised 131 bushels of ears of corn per acre, weighing 40 lbs. per bushel. I counted one ear that had 894 grains. Variety, yellow flint. It ripens earlier than our white corn. The ground was broken and planted without harrowing. Rows four feet apart, and hills two feet in the rows and two stalks to a hill. Cultivated three times twice in a row."—I fancy Mr. C. is a far more "thorough tiller of the soil" than he pretends to be.

I have an idea that there were not many weeds in that crop of corn.

"W. H.," of Grey Co., Ontario, asks the relative value of oil-cake and peas for fattening cattle. I do not think there is much difference. If anything, the oil-cake, provided it is genuine linseed oil-cake, is the most nutritious. I do not know how it is in Canada, but here I fear there is a good deal of poor stuff sold for oil-cake meal. I think half pea and half corn meal is better for cattle than all peas or all corn. Oil-cake enough to keep the bowels in order is also very advantageous. Much more depends on management and judicious feeding than on the actual and exact quantity of nutriment in a food. The farmer who does not keep flax-seed or oil-cake on hand, for at least occasional use, does not live up to his privileges.

I little thought when the Deacon and I talked about Mr. Bliss's potato prizes that he would act on our suggestion and offer such liberal premiums for the largest yield per acre. I want the Deacon and the Judge and the Squire to see which can raise the largest crop of our common varieties, and I wish others would join in. I propose to plant Early Rose, Late Rose, and Red and White Peachblows. I raised all these in one field last year, and the Late Rose was very decidedly ahead. Perhaps it may not be so in all seasons. The Peerless is grown to some extent here, and yields large crops. So far it sells as well in market as any other kind, and as long as this is the case it is a profitable variety. I notice an article in one of my late English agricultural papers on the "New American Potatoes," in which it is said: "It is not probable that we shall ever beat the Americans in the matter of raising crops. Our tubers won't be so large, although we may get as many to a root. This will be no evil, but rather a gain. We shall get better quality in our medium-sized tubers than they get in their large ones, and they will not be so liable to disease, as it is a fact that wherever disease prevails the largest tubers are most affected." It is new to me that we raise larger crops of potatoes here than in England. And I think it can not be true. I supposed three or four hundred bushels per acre was not an uncommon crop in England. Here 125 bushels is a fair average. I presume the tubers are not as large in England owing to the fact that they plant in drills and much thicker than we do when we plant in hills. Here farmers seldom apply manure to potatoes, and that is the main reason why we do not raise as large crops per acre as they do in England. We want to study not only the varieties, but how to so manure and manage the land as to grow large crops without any deterioration in quality. It seems a shame that in this great and fertile country consumers should now have to pay \$1 a bushel for potatoes, and those by no means of extra quality. There is money to be made in raising potatoes.

How to Load a Horse-Power.

"B. K. A.," Lancaster Co., Pa., sends us two methods of loading a horse-power which are in use in his neighborhood. One is to procure two scantlings or planks framed together with cross-pieces. At one end of this frame is a roller eight inches in diameter with holes in it for pins, by which it is turned. The frame is twice as long as the power, and is hooked on to the hind axle or bolster of a wagon so that

it will tip like a cart body. The wagon with the frame is backed up to the horse-power to be loaded. A rope or chain is hooked to the power, and is wound up upon the roller, draw-

Fig. 1.—LOADING HORSE-POWER.

ing the horse-power, beneath which small rollers are placed, on to the wagon. When it is to be unloaded, the horse-power is run back until the end of the frame rests upon the

Fig. 2.—POWER READY FOR WORK.

ground, when it is in the right position to be used. Fig. 1 shows this method.

The other method is to mount and fasten the horse-power upon the hind axle of the wagon

Fig. 3.—POWER READY FOR REMOVAL.

so that it may be readily tipped backwards. The reach is loosened from the fore part of the wagon when the power is to be used, and it is simply tipped up against the barn floor or upon it where it is needed. It may be propped up securely at the exact angle required. When it is to be removed the reach is brought down and fastened again into its place. Figures 2 and 3 show how this is managed.

Plan of Barn Yard.

We are asked for a plan of an inclosed barn yard suitable for a farm upon which the raising and feeding stock is the chief business, and in which economy of labor is of greater consideration than the first cost of the buildings. Having considered this matter and made some practical approach ourselves to the plan laid

out at figures 1 and 2, we are led to believe that there are many points of convenience and advantage in it, and that it will be of service to our readers. Fig. 1 represents the ground plan, in which the barn is shown at a. As will be observed there are no stalls for stock in this building; it is reserved altogether for storage for feed, grain, fodder, and apartments for preparing the feed. Upon each side of the barn are stalls, b b, for oxen or cows. At c c are stables for work horses, and loose stalls for mares, stallions, or colts. At d are loose stalls or pens for calves or young cattle or bulls. Each of these stalls should be 16 feet square inside, and a feed passage at least 5 feet wide should pass around the whole range and

through the central barn. At e is an office for the reception of tools and stable implements, the storage of materials for repairs and for making repairs of harness, etc., and for medicines and such surgical and other instruments as must of necessity be kept upon every well appointed stock farm. At f are the pig pens, with poultry roosts above them; the stairs at each end of the building giving access to store rooms for grain and feed for both pigs and poultry. At g are the manure wells, having cemented cisterns in the center, of such a depth as may be needed. If liquid manure is to be saved

and used, the cisterns should be 8 or 10 feet deep, covered with bars, and pumps should be attached to each one. The manure wells are surrounded with stone walls four feet high except at one end, for the purpose of retaining it in a compact shape and neat condition, and so that wagons or carts might be backed upon the manure to be loaded when desired. At h is the cistern which receives the whole water shed from the roofs, and which is carried off by spouts and pipes. The pump upon the platform should be a force pump so that the water might be forced to any part of the buildings, or into supply tanks for each stable, or by means of a rubber hose into scattered water troughs around the yard. At each side of the pig pen gates give admission to the yard, which should be paved with cobble stone where practicable on account of the extreme cleanliness and dryness which such pavement renders attainable. A side entry as at i will also be found a great convenience. There are many advantages connected with this plan which we have not space to enlarge upon, but which, upon examination, will be readily perceived. Where a sufficient number of stock is kept to make such an arrangement desirable, its cost will

be found much less than that of scattered buildings, while from a partial adoption of this plan in our own experience we can sug-

Fig. 1.—PLAN OF BARN YARD.

gest none that offers more conveniences. Figure 2 shows the elevation of the buildings, substantially but very plainly built. The plan

Fig. 2.—ELEVATION OF BUILDINGS.

admits of any amount of elaboration architecturally or otherwise that may be wished.

Concrete Building.

Charles Hodgkinson, Seott Co., Ill., sends us his plan of building concrete houses, which in many places in the West, especially where building materials other than lime and gravel are scarce and dear, may be found acceptable. He commences by making a solid foundation

Fig. 1.—PLANK, CLEATS AND PIN.

of stone or brick-work and leveling the surface carefully. Upon this he places his set of boxing, shown in the engraving. The boxing or frames are made of inch boards 12 inches wide and all of one size. Cleats are nailed upon each end and on each side, as seen at a, to pre-

Fig. 2.—MANNER OF PLACING THE BOXING.

vent warping. Holes one inch in diameter are bored through the boards and pins of oak are

made to fit them loosely. A small hole is bored through each end of the pin into which a nail may be put to hold the board in its place. The pin is shown at *b*, and it is made long enough to pass through the walls and the boards and cleats upon each side of it, and two inches or more to spare at each end. For a 12-inch wall the pins would then be 20 inches long. Cleats two feet long, three inches wide, and an inch thick are then made as seen at *c*, and are bored to correspond with the holes in the boards for two sets of boxing. When these are ready the building is commenced by placing a row of boxing around the foundation, the boards being held apart by strips shaped like that shown at *d*. When the boxing is placed it is filled with the concrete, which is rammed solidly down. The concrete is made by mixing one

Fig. 1.—VIEW OF A CHEESE FACTORY.

boxing are used afterwards as sheeting for the roof, and no material is wasted.

How to Start a Cheese Factory.

The factory system of making cheese is easy and economical as compared with a private dairy. In a factory, the milk of 300 cows may be worked up with about the same labor and with about half the proportionate cost of materials as that of 30 cows in a farm dairy. If ten or more farmers can associate themselves into a factory company, and by so doing save the labor of nine of them and half the cost of furnishing ten separate dairies, it is an important economy. We need not

Fig. 2.—PLAN OF A CHEESE FACTORY.

part of good lime with two parts of clean sand and one of coarse gravel. This will occupy one day. The next day another set of boards are set up without removing the first set, the cleats projecting as seen in the engraving, being all ready to receive the boards. This set is then filled the same as the previous one. The next day the nails or keys are removed from the lower pins, and they are knocked out of the wall and the lower boxing is removed. The cleats are then swung around so that they are reversed, and the lower parts are then made to project above the second row of boxing. Another row is then placed in position and filled, and this process is repeated until the walls are raised sufficiently. The rate of building is one

Fig. 3.—CONDUCTOR PIPE.

foot per day, which gives ample time for the consolidation of the concrete. The door and window frames are made of plank of equal width with the thickness of the walls, and are built into them. At the corners of the building at every foot square pieces of board are

enlarge upon this view of the case; it is apparent to everybody.

There are several methods of starting cheese factories. One is the joint stock system, in which the cost is divided into shares which are distributed in convenient proportions amongst the proprietors, who choose from their number a president as general superintendent, a secretary, treasurer, and a business manager or a committee of management. The shareholders supply milk to the factory according to the number of shares they own (one cow generally representing one share), and the expense of making the cheese and the proceeds of its sale are divided pro rata amongst the shareholders. The cheesemaker is hired and makes the cheese, furnishing all help and everything except the machinery at a fixed rate per pound of marketable cheese. Another plan is for one or more parties to own the factory and make the cheese at a certain rate per pound of cheese sold, the cheese belonging to the patrons or farmers who supply the milk and sold on their account by a person or committee ap-

pointed by them. Another plan is for the factory to be owned as in the last preceding case, and to purchase the milk outright from the patrons at so much per pound, and pay for it in cash as may be agreed upon. The cheese then is the absolute property of the owner or owners of the factory. In general practice this last plan is found the best and the freest from occasions for dispute or disagreement. Unfortunately it has been found necessary under whichever system a cheese factory is managed, to make very stringent regulations and agreements, and to attach severe penalties to their violations in order to prevent adulteration of the milk, not so much through dishonesty, as has been said by Mr. Harris Lewis, a noted dairyman and factory expert, as to rivalry as to who should produce most milk.

Fig. 4.—WEIGHING CAN.

When, however, the preliminary arrangements have been made, the site and building become the next considerations. The site should be dry, free from any taint in soil, water or atmosphere, with good drainage and well supplied with cool spring or well water in a constant flowing current, by gravitation or by means of mechanical power. The building should be proportioned in size to the number of cows supplying it. For a private factory for 30 to 60 cows, a building 18 x 24 would be sufficient, with the upper story for a curing-room. For 100 cows, the building should be 28 x 45, with 18 feet posts. 18 feet at one end should be partitioned off for a making-room, and the remainder, with the whole upper floor, will be used for the curing-room. For 200

Fig. 5.—CURD KNIVES.

For 200 cows, the building should be 55 feet long; for 300, one will be required 65 feet long, with an

Fig. 6.—ONEIDA VAT.

addition of 6 feet to the width of the making-room, 20 feet long. For 400 cows, it should be

Fig. 7.—CURD MILL.

addition of 6 feet to the width of the making-room, 20 feet long. For 400 cows, it should be

75 feet long, by 36 wide. For larger factories with 600 to 1,000 cows, it may be better to have the curing-room a separate building from the

Fig. 8.—PRESS RING AND HOOP.

make-room. In such a case, the make-room might be connected with the dwelling provided for the superintendent, and a building 24 x 40 feet or larger should be provided for it. The curing-room would then need to be made from 24 to 36 feet wide and 75 to 120 feet long. The general character of the needed buildings may be gathered from the accompanying engravings. Fig. 1 represents a factory of 600 cows, at Rutland, Vermont, which we recently

Fig. 9.—IRON PRESS RING.

visited, and which includes dwelling-rooms, make-room, and curing-rooms. The small addition at one end holds the heater by which the curd is cooked, and that at the front is the covered driveway at which the milk is received. In front of the driveway is a platform upon which is fixed a pump for delivering the whey which is stored in a vat beneath it.

The interior arrangement of this factory, shown at fig. 2, is very similar to that of other cheese factories. The make-room is supplied with vats, AAA, which are heated by steam pipes passing from the heater, B, in the adjoining room. The whey is run off through pipes into the vat already mentioned. The draining vat, C, is placed so that the curd may be readily dipped from the milk vats into it. The weighing platform, D, is connected with the receiving platform outside, and is made such a high that the milk may run from the weighing can, fig. 4, by means of the conductor head and pipe, fig. 3, into the cheese vats, where it is immediately cooled down until all the odor is dissipated. For small factories in which no heater or steam engine is needed, the Onida vat, fig. 6, is used, which is provided

Fig. 10.—SINGLE CHEESE PRESS.

with heating apparatus for cooking the curd. After the curd has formed, and before it is cooked, it is cut into small cubes with the curd knives, fig. 5. After cooking, the curd is dipped into the draining vat, C, fig. 2, where it is suffered

to cool. It is then ground in the curd mill, fig. 7, which, in small factories, is operated by hand, but in large factories by a steam engine. The press hoops now come into use. Those for small factories or private dairies are of wood, fig. 8, or of iron, fig. 9. The press is shown at fig. 10. For large factories the gang press, fig. 11, is now generally used, and is found very economical. The presses are ranged around the make-room, E, fig. 2, and a drain carries the drip of whey from them to the whey vats. After the cheeses have become compact, they are removed from the presses and taken to the curing tables. These are long tables of wood free from resinous or other matter that would flavor the cheese, about 3 feet high and 33 inches wide, or sufficient to hold two rows of cheeses. In the New York factories the tables are generally closely jointed

Fig. 11.—GANG PRESS.

at the top, while those in the Vermont factories are formed of bars or scantling placed longitudinally three or four inches apart. We are not prepared to decide which of these forms is the better, but our preference is for the Vermont fashion. These tables need to be very strong to sustain their load of cheese. Indeed, the whole of the building needs to be

Fig. 12.—CURING HOUSE.

substantial and solid, although it may be of the plainest material and workmanship consistent with economy. Fig. 12 shows the curing-house belonging to the Whitesboro factory in Oneida Co., New York. This curing-house combines all the requisites needed; it has perfect ventilation beneath, being elevated upon posts, non-conducting double walls to preserve the necessary evenness of temperature, thorough ventilation above, shaded windows, and within, spacious airy apartments. This curing-room we consider a model one, as indeed is the whole factory as to its management, although the make-room is somewhat old fashioned, for the cheese from this factory has acquired a high reputation in England.

The cost of the factory building depends altogether upon that of the materials, and very close estimates can be made in any locality from the descriptions here given. The apparatus, such as has been described for a dairy of 20 cows, will cost at the manufactory in the city of Utica, N. Y., the headquarters of this business, about \$70 to \$90; for 30 cows, \$90 to \$120; for 40 cows, \$105 to \$145; for 70 cows, \$135 to 180; for 100 cows, \$260 to \$325; for 200 cows, \$400 to \$475; for 300 cows, \$555 to \$700; and for 400 cows, \$650 to \$820.

Varieties of Milk.

That the milk yielded by cows of various breeds differs very much in quality and character is a well-known fact. For this reason it is necessary that the dairyman should select a certain breed of cows which he has learned by experience or otherwise is best suited for his special branch of this business. The maker of fancy butter chooses the Jersey as his cow, for the reason that from her milk the cream rises very rapidly and in large quantity, churns quickly, and yields a rich-colored, fragrant

Fig. 1.—JERSEY MILK GLOBULES.

butter. The Ayrshire breed furnishes not only a cow second only to the Jersey for the butter dairy, but one which is pre-eminently a cheese producer; while the Ayrshire and the Dutch breeds are best suited for the dairyman who supplies towns and cities with milk. That these peculiarities in the several breeds here noted were due to some peculiar characteristic of the milk was very evident, but exactly what those characteristics were, has not been generally known. The composition of milk has long been under investigation, and many microscopic examinations of it have been made, which have shown it to be a complex fluid in which are suspended a varying quantity of globules of fat or butter, each inclosed in an enveloping film, or membrane. These globules being lighter than the milk in which they are suspended, rise to the surface when the fluid is kept at rest, and form what we know as cream. When this cream is agitated or churned, the sack inclosing the globule of butter becomes broken, by the crushing or wearing action of the dash of the churn, and the butter separates. All this has long been known, but why the cream of the Jersey cow or of some other cows of a similar character should rise rapidly and abundantly and should churn readily, and why the skimmed milk of these cows should be very blue and poor, yielding a very poor cheese, known from its character as a "white-oak" cheese, while exactly the contrary should occur with an Ayrshire or a Dutch cow, remained a matter for investigation. At the last winter meeting of the Vermont Dairyman's Association, Dr. E. L. Sturtevant, of Massachusetts, gave the results of over 9,600 microscopic examinations of the milk of the Jersey, Ayrshire, and Dutch cows, from which he gathered that

Fig. 2.—AYRSHIRE MILK GLOBULES.

very blue and poor, yielding a very poor cheese, known from its character as a "white-oak" cheese, while exactly the contrary should occur with an Ayrshire or a Dutch cow, remained a matter for investigation. At the last winter meeting of the Vermont Dairyman's Association, Dr. E. L. Sturtevant, of Massachusetts, gave the results of over 9,600 microscopic examinations of the milk of the Jersey, Ayrshire, and Dutch cows, from which he gathered that

Fig. 3.—DUTCH MILK GLOBULES.

the butter globules of these varieties of milk are very distinct in appearance, and that their different characters very readily account for their different behavior in the dairy and in the churn. For instance, the Jersey butter globule is larger than that of the other breeds, and is of a more uniform size, there being in Jersey milk very few small globules or granules, as they have been termed by himself and other investigators. The character of the globules in the Jersey milk is shown at figure 1, A. At figure 2 is seen the character of the globule of the Ayrshire milk, and at figure 3 that of the globule of the Dutch milk. The cream of the Jersey milk, consisting of large globules, rises quickly, sometimes separating wholly in four hours, leaving a blue skim-milk beneath; the cream of Ayrshire milk requires over ten hours to rise only in part, leaving a very white and still rich skim-milk. Amongst the Ayrshire cows there exists a family of butter cows whose milk throws up the cream almost as rapidly as that of the Jerseys. The Dutch milk throws up the cream more quickly than the Ayrshire, but the globules being comparatively small the cream is readily mixed with the milk again by stirring. This cannot be done with the Jersey milk. The Jersey cow, therefore, stands first as a butter producer, but is a poor cow for producing milk for sale, and a very poor one for cheese; the Ayrshire cow stands next to the Jersey as a butter cow, but first of all for the cheese dairy or for the milkman, and is therefore pre-eminently the useful cow for all purposes. The Dutch cow stands second to the Ayrshire and before the Jersey for the purposes of the cheese maker or the milkman, but third and last as a butter cow. These characteristics, well known in practice, are explained when we come to examine closely the character of their milk.

Laying out a Western Farm.

In the western states where land is subdivided into squares or parallelograms, the laying out of a farm would seem to be one of the simplest things possible. Nevertheless frequent mistakes are made in doing this, which add to the cost of fencing, to waste of land and to waste of time in passing to and from work, and in hauling in the crops. A square field requires less fencing than one of greater length than breadth. If there are more roads than necessary, land is wasted; and if the homestead is at one end or one side of the farm, much time is lost in reaching the distant fields. In the accompanying plan we propose a method of laying out a farm which avoids all these wastes, and in which the homestead is not only in the most convenient position, but is sheltered by belts of timber and plantations from the prevailing winds.

The homestead faces the east, and is supposed to be in the center of an 80 acre or a 320 acre tract. For a 40 or 160 acre tract which is square, the same general arrangement would answer. The fields are squares of 10 acres each in an 80 or 160 acre tract, and 40 acres each in one of a 320 acre. A belt of timber is placed across the north end of the tract and along the east side of the northeast field. Another plantation is made in the northwest corner of another field; both of these together will furnish protection to the farm and the farm buildings, which should be placed somewhere near the smaller belt of timber and within its protection. The house is surrounded by an orchard at the rear, and scattered groups

of trees ornament it and shelter it upon the east and south. If those who are now settling up the vast prairies would take some pains to lay out their new farms and plant their orchards and protecting groves in some such method as is here described, the face of the country would very soon become a scene of unsurpassed beauty, and the present bleak, unsheltered, dreary aspect of the landscape in winter would disappear in a few years. The money value of the timber, and the shelter with its accompanying beneficial influence upon the climate would far more than pay the cost of labor and the very small necessary outlay of money. In the plan there are no farm buildings laid down, as the slope or other configuration

PLAN FOR LAYING OUT A FARM.

of the ground and the supply of water would affect the choice of their location, but in general it would be found convenient to place them near the homestead where we have indicated.

CULTIVATION OF TOBACCO.—The magnificent castles in the air which have been erected during the past few years by the over-sanguine tobacco growers now lie in ruins. The unfortunate builders are disappointed and disgusted. It was ever thus with growers of what may be called special crops. For a few years large profits tempt greater ventures and then come excessive crops for one or two seasons and prices go out of sight. A Connecticut farmers' club has of late discussed this matter. It was there stated that in Franklin County there was enough tobacco for sale to give 25 dollars to every person, old and young, in the county. We have heretofore cautioned our readers that this result might happen; that tobacco was one of those illegitimate crops, so to speak, which might be profitable for a season, but were a poor dependence. What is to be done? A tobacco stubble makes an excellent ground for a corn crop or a root crop. We have heard of 45 bushels of wheat having been harvested from one acre of tobacco land in Massachusetts; 100 bushels of corn would not be a more valuable crop, which with the fodder, would bring nearly \$100 per acre; this would be probably as much as many tobacco crops in the palmy days of the business have yielded, net, and twice or four times as much as it would now yield. It is now a good time not to grow tobacco. When the surplus is worked off it will doubtless be again profitable. Tobacco is a risky crop.

FRENCH AGRICULTURE.—The superficial area of France, according to the official returns, consists of 115,500,000 acres. Of these over 36,000,000 acres are owned by proprietors whose estates cover only 8½ acres upon an average. Over 16,000,000 acres are owned in farms of an average size of 35 acres; over 19,000,000 acres consist of farms of an average of 87½ acres, and of farms of an average of 415 acres there are but 43,000,000. Nearly twenty million of the population subsist upon the smallest sized farms; two and a half million upon those of an

average of 35 acres, and only one million upon each of the other classes of farms. The consequence is that three fourths of the population never taste sugar or beef, but live in the greatest economy upon bread and vegetables and drink water or the poorest wine or cider.

How Leather is Tanned.

The business of tanning leather is a rather complicated one, and can not be well undertaken without the expenditure of a good deal of capital in buildings and machinery. As the process occupies some months, it is also necessary that a large stock of material should be accumulated, and this adds to the amount of capital needed to carry on the business. A very small tannery would require \$20,000 to put it in operation, and there are many large ones in which ten to twenty times that amount is invested. It is also necessary for the business that a supply of bark should be near at hand; we therefore find the tanneries near extensive tracts of timber land in which oak and hemlock predominate. The stripping of the bark from the trees can only be done in the spring; that from oak trees is only to be procured in the month of May, while that from hemlock can be stripped during May and June. The whole year's supply of bark must therefore be secured in these months and piled up and stored for use. Very large sheds are needed at every tannery for storage of the bark. Fig. 2 of the accompanying engravings shows the method of gathering the bark. The trees are cut down, and the bark is cut all around the tree every four feet in length with the axe. It is then split from cut to cut. A long handled spud or blunt chisel is then inserted beneath the bark, and if peeling well it separates with great ease in one piece four feet long all around the tree, otherwise it comes off in smaller pieces. The bark is laid out to dry, and then piled up into cords ready to haul to the tannery, where it is stored under cover. In drying the bark care must be taken to keep it from mildew, which spoils its color and quality. The bark is ground as it is wanted for use in strong iron mills, fig. 3, to a coarse powder. The ground bark is taken from the bark mill by means of conveying spouts, or elevator cups, like those used in grist mills but much larger, to the leaches, where it is soaked in hot

Fig. 1.—A HIDE DONE UP.

water until all the strength is extracted, and a dark liquor, very much like strong coffee in appearance, is strained from it. The waste bark is what we know as tan-bark, and is useful for packing ice, bedding for cattle when dry, and for making gentle hot-beds. The tan liquor is run into large vats for use. The hides undergo various preparatory processes before they are put into these tan vats. They come to the tannery either in the shape seen in figure 1, which is a green country hide, properly folded and tied, or as dry or green salted. In this last shape they have no horns attached and are tied up in somewhat the same shape as the fresh hides, but having been kept for some time, or coming from South America or Texas, they do

not smell very agreeably. At the tannery they are first put into soak vats, which are filled with water only. Here the salt is dissolved out of them, and all dirt and sand which adheres to

Fig. 2.—COLLECTING TAN BARK.

the hair is loosened and separated. They then go to the lime vats, figure 4, in which they remain eight days in strong lime water, being occasionally turned and moved from one vat to another, by means of hooks fastened to the ends of long poles. This lime water loosens the hair so that when, after the lime bath, the hides are put upon the "horse," figure 5, and scraped,

Fig. 4.—THE LIME VATS.

the hair is all removed with ease. The flesh which may remain upon them, and all rough tags, are shaved off with the sharp edge of the knife which is seen in the workman's hands. After the scraping the hides are put into other vats in which there is a solution of hen manure for the purpose of freeing them from lime. Here they remain six days, when they are bathed in a somewhat rough manner, by means of wheels similar in shape to water wheels or paddle wheels of a steam boat. These wheels

Fig. 6.—BATHING WHEELS.

are shown at figure 6. After this process they become very soft and smooth. They are then put into the vats of tan liquor, figure 7, and here the process of tanning really commences, all the previous processes being merely preparatory. The tan liquor contains, as is well known, a strong astringent principle, which it

has dissolved out of the bark. This astringent principle is called tannin. It has the chemical property of rendering the gelatinous part of the hide insoluble in water, and almost indestructible so long as it is kept dry. It is this which changes the hide into leather—a chemical union of the tannin is formed with the glue or gelatine of the skin. A long time is required for this change to take place, and the hides remain in the tan liquor for three months before it is complete. They are, however, handled many times during that period, and are removed frequently from one vat in which the tan liquor

has become exhausted, into others filled with fresh liquor. When this process of tanning is complete, and the hide has become leather, nothing remains but to dry it in the upper rooms of the tannery, where currents of air are admitted through slatted or open windows. It then appears as a yellowish brown skin, hard, tough, and flexible, and thick or thin according

to the kind of hide which has been tanned. It is then split down the middle and becomes two sides of leather. Heavy ox-hide or cow-hide is made into sole leather; light cow-hide, two-year old hides or kips, and calfskins are colored black and curried and used for upper leather; the best of the cow or ox hides are selected for harness leather, which requires not only great

strength, but great solidity and density, to fit it for the use to which it is to be hereafter put.

Farmers' Clubs.

We notice with great satisfaction the increase of these institutions in all parts of the country, and notably in the New England States, and the provision they are making for the entertainment of rural communities. They are so well managed in many places that they contribute a

very important element to the social and intellectual life of the people. They are taking the place of lyceums, and to some extent of balls and fashionable parties. Their informal and business character makes them attractive to many who think they have no time for visiting and social enjoyments. Pomology and floriculture receive a due share of attention, and make the meetings acceptable

to villagers, who have only fruit yards, gardens, and conservatories. Indeed, the most flourishing clubs generally have their center in the village, and the winter meetings are held in some public hall. Sometimes a course of lectures is given which draws full houses from village and country. Often there are dis-

sussions upon questions of practical interest which bring out the experience of the best cultivators in the town. Exhibitions of fruit and flowers and exchanges of grafts and seeds and eggs are

Fig. 3.—GRINDING THE BARK.

frequent adjuncts of these meetings, and not the least important of their advantages. The educating power of these clubs is very great. They quicken thought in many ways. They direct the attention to the best methods of husbandry. They serve to economize time and labor, and introduce new fruits, flowers, implements, and stock. They break up the dull rou-

Fig. 5.—SCRAPING THE HIDES.

tine of the farmer's life, and are doing something to make farm life attractive to the young. We have often called the attention of our readers to the value of these clubs in past years, and are glad to see that the good seed sown is springing up in so many places. The State Board of Agriculture in Connecticut has been doing a good work the past winter, in holding meetings in connection with these clubs in various parts of the State, for lectures and discussions. The meetings have generally been con-

Fig. 7.—THE TAN VATS.

finned to one day in a place, holding three sessions. Lectures have been given by Professors Johnson and Atwater, and by the Secretary, T. S. Gold, with discussions at the close. It would do much to popularize the work of our boards of agriculture if they would follow the example of Connecticut in all the States.

Annuals—Drummond's Phlox.

When Mr. James Drummond, some fifty years ago, first saw the little Phlox which now bears his name, he could hardly have foreseen that it would become perhaps the most popular annual in cultivation; and instead of the rose-purple color that belongs to it in its native state it would "break" into a great variety of colors and shades which would receive distinct florists' names. The writer has seen it covering large stretches of prairie, where, though pretty, it appears rather common, and bears but little resemblance to the choice and brilliant varieties of the garden. Drummond's Phlox, or *Phlox Drummondii*, as the catalogues have it, is one of the few annuals that the English gardeners admit in their lists of plants for the elaborate bedding designs now so much in favor in their country, but which have not been extensively practiced in this. Those who wish to attempt the massing style of planting will find the different varieties of this Phlox well suited to experiment with. The plants vary but little in height, and there is no trouble on account of a difference in growth as where several plants of a different kind are used. In colors there are pure white, rose, pale yellow, several shades of crimson and purple, and the most brilliant scarlet, and besides various combinations of color, as pure white with purple eye, purple with a white center, and several with stripes and marblings of contrasting colors—surely variety enough for one plant to produce. A circular or oval bed planted with successive lines of strongly contrasting colors makes a most brilliant show. We rarely see this plant in perfection, and the same may be said of other annuals. A packet of seeds that costs but ten cents may produce 50 or 100 plants. As each plant costs so little, only the fraction of a cent, it is very natural that it should not receive the same care that would be bestowed upon a Geranium or other plant purchased from the florist for 25 cents. Hence, annuals are generally crowded, ill-shaped, weedy looking affairs, which after a short season of bloom, die away, or become so utterly shabby that they are pulled up in disgust. To have this Phlox in its best condition it should have proper treatment, and what is advised for this should be followed with most other annuals. The seed should be sown this month in boxes of light rich earth; sow thinly in drills, keeping the varieties distinct; those who can may place the boxes in a gentle hot-bed, but a sunny

window will answer quite as well. When the plants are large enough to handle transplant them to other boxes, setting them two inches apart each way; shade for a day or two, and then give them plenty of light, but do not scorch them; water as needed, and give air when the outside temperature will allow.

flower, and it may happen that a line will have a "rogue" or two—that is, plants that have not come true to kind; such plants should be taken up as soon as they "show their colors," and replaced by those that have been kept in reserve; being in pots they may be turned out without checking their growth, and any unseemly breaks in the bed be avoided. If the branches of one row grow in with those of the next, so as to destroy the well defined line between them, the scissors must be used to remove all unruly growth. To secure a long continuance of bloom no seed should be allowed to ripen on the bed; as soon as a cluster has passed its prime clip it off; if allowed to bear seed the plants will become exhausted. If it be desired

A GROUP OF DRUMMOND'S PHLOX.

When the plants are about three inches high "stop them," as the gardeners say, which means to pinch out the growing point in the center; this will have the effect of making them throw out side branches, and for this reason the distance of two inches was advised in transplanting. Before the time for setting out, in May, or whenever the ground is well dried and warmed and cool nights are over, the plants should be thoroughly hardened off by exposure in boxes, day and night, to the open air. One great trouble with this plant is its tendency to mildew, which may be avoided by giving plenty of room. Most of the varieties grow about a foot high, and these should be set a foot apart; some of the newer varieties are said to be only six inches tall, and these may be placed as many inches apart as they are high; these low-growing kinds must be planted at the margin of a

to raise seed for another year a plant or two of each kind may be set in another place expressly for this purpose. It may be added that the seeds should be gathered as soon as the pods begin to turn brown, or else they will open on the plant and the seed be lost. We have given thus in detail what we consider the treatment best for the majority of annuals. Some do not need to be pinched, but the other points must be observed if really good results are desired. The engraving here given is from the new and elegant catalogue of Messrs. Briggs Brothers, Rochester, New York.

Combined Cellar and Greenhouse.

BY PETER HENDERSON.

A COMBINED CELLAR AND GREENHOUSE.

bed with the taller ones nearer the center. In planting a bed with lines of various colors it will be a good plan to put a few plants of each kind into small pots and keep them in reserve. The plants in the bed will soon begin to show

Many years ago an accidental circumstance gave me an opportunity of proving the utility of combining a cellar and greenhouse under one roof. An excavation of 20 feet by 40 had been made, seven feet deep and walled up with stone, and the beams laid across preparatory to placing a building on it, when the owner changed his plans and found himself with this ugly excavation but a dozen yards from his costly residence. There seemed to be no alternative but to fill it up or plank it over; but both plans were objectionable, and in discussing how to get out of the difficulty I suggested erecting a low-roofed greenhouse over it, as the owner had a taste in that direction. This suggestion was followed, raising the walls one foot above the surface and erecting a span roof of glass.

My idea (which was found to be nearly correct) was that the large volume of air in the excavation, which would at all seasons average about 40°, would be sufficient to keep the upper or greenhouse portion of the structure above

the freezing point in the coldest weather. This it did completely when the glass was covered at night with shutters; and the plants with which it was filled, of a kind requiring a low temperature, kept in better health than if they had been grown in a greenhouse having fire heat.

Now, although I have never seen such a combination since, I am satisfied that in favorable circumstances such a structure might be made of great advantage and at a trifling cost, for as it dispenses with heating apparatus, which usually is more than half of the whole cost in all greenhouse erections, the use of a cellar and greenhouse could be had at probably less than the cost of an ordinary greenhouse; and for all half hardy plants—plants that will do well in winter if kept but above the freezing point—such a greenhouse will be better for many varieties than any kind of greenhouse heated by fire heat. All kinds of Roses, Camellias, Azaleas, Zonal Geraniums, Violets, Cape Jessamines, Carnations, Abutilons, Verbenas, Primulas, Stervias, and, in short, all plants known as cold greenhouse plants, will keep in a healthy though nearly dormant condition during the winter months, but growing and blooming with increased vigor at their natural season of growth, and flowering as spring advances. Besides the cellar may be used for the ordinary purposes of such a place; or if exclusively for horticultural purposes, no better place can be had for keeping all deciduous hardy or half hardy plants, Hyacinths in pots to start to flower, or any bulbs of similar nature. The great point to be observed is that the soil where such a structure is to be formed is entirely free from water, or if not so naturally must be made entirely dry by draining.

The style that I think would suit best for general purposes would be twelve feet in width, and of any length desired. The excavation should not be less than seven feet deep, walled up to about one foot above the surface. When complete it would show something like the section in the cut annexed. If the glass roof is made fixed it should have ventilating sashes 3×3, at intervals of six or nine feet on each side of the roof; if of sashes they should be seven feet long by three feet wide, every alternate one made to move for ventilation in the usual way. The position of the structure would be best ending north and south. The shutters best for covering the glass with at night are those made of light half-inch pine board, three feet wide by seven feet long.

It will be understood that the advantage of this combination of cellar and greenhouse over the ordinary cold pit is that the air of the greenhouse is warmed or equalized by mixing with the atmosphere of the cellar, which will rarely be less than 40°. For the same reason, if a high temperature by fire heat was wanted, say 70°, this atmosphere of 40° from below would make it difficult to be obtained. It will be necessary, of course, to have the flooring boards covering the cellar wide enough apart to freely admit the air; this will at the same time give light enough for any operations necessary to be done in the cellar.

Treatment of Tropical Bulbs, Seeds, etc.

BY PETER HENDERSON.

Any information that can be given in an article short enough to be suitable for your columns on a subject so extended as this must be confined to a few well known and leading plants most valued for general cultivation.

First may be placed the Tuberose, which in most Northern States must be artificially forwarded to bloom in perfection in the open air. The seasons are too short for the full development of the flowers in fall unless the bulbs are so forwarded. All that it is necessary to do is to place the dry bulbs in soil in pots or in boxes about May 1st (not before), keeping them rather dry until they start to grow freely, when more water may be given. Plant the bulbs thus started in the open border the first week in June. The bulbs while being forwarded may be kept in any place where the thermometer ranges from about 65° to 75°. At night we usually place them under or alongside the hot-water pipes in our greenhouses, covering them up with paper to keep the heat of the pipes from them. Light is not necessary until they have well started to grow. A greenhouse is not at all essential to start them in, as a hot-bed or even a warm sitting-room will do nearly as well. Any one wishing to have their Tuberoses "started" can do it themselves just as well as a florist can, and as the dry bulb costs less than half the price of the started one, and is more safely transported by mail or otherwise, any one taking the trouble to do it will save expense and have the bulbs in better condition for planting.

Some of your readers have seen or cultivated the bulbs known as fancy or spotted-leaved Caladiums. There are probably no plants that assume such a varied and wonderful marking of the leaves as these, and when properly grown they are among the most attractive plants at our horticultural fairs. The continued high temperature necessary for the healthy growth of the Tuberose is equally indispensable for the Caladium. The bulbs we treat at first exactly in the same manner as the Tuberose; that is, they should not be started much before May 1st, and never should they be kept for any length of time in a less temperature than 65°. They are best started in small pots, and should be shifted into larger ones as soon as these get filled with roots. Started in May, and properly treated, they should be large enough by August or September to require a flower-pot twelve inches in diameter, and the plant should be, according to the variety, from two to three feet in diameter across the leaves. Caladiums require a partial shade, and if kept in a greenhouse during summer the glass should be shaded, but the light of an ordinary sitting-room would just be about right; so that even those not having a greenhouse can grow these rather rare and beautiful plants with perfect ease. The only thing necessary, if grown as a window plant, would be to turn the plant around every few days so that each side would get the light—a necessity with all plants grown in windows. The soil best suited for its growth is that known as sandy loam, to which should be added one-third rotted manure or leaf mold.

The same time of starting and a similarly high temperature is required for Begonias of all kinds, Bouvardias, Cissus, Coleuses, Dracenas, Euphorbias, Poinsettias, and all other plants known as "hothouse" or "tropical," and the same general treatment will in nearly all cases lead to satisfactory results. All of the plants or bulbs referred to will dwindle or die if long kept in a low temperature, and hence it is important that amateurs should remember that they ought not attempt the cultivation of these plants unless they have the means of steadily keeping up the necessary high temperature. For that reason we recommend that

they should not be started before May, as at that time there is less chance of being chilled.

What is true of tropical bulbs or plants is equally so of tropical seeds. All seeds of tropical plants are safer, in the hands of those who have not had experience or the means of keeping up the necessary high temperature, not to be sown before April 1st. Of vegetable seeds the best known of this class are the Tomato, Pepper, and Egg-plant. I know they are often started in March in hot-beds or greenhouses with satisfactory results, but let any one try the experiment of sowing March 1st and April 1st, and note the result in the earliness of crops, and he will find that the chances are that the last shall be first; not but what if it were always practicable to keep the necessary temperature steadily along that the first sown would not be first, but that this is often very difficult to accomplish, while there is but little difficulty with the later sowing, as assistance is then given by the increasing outside temperature. For this reason, seeds of tropical annual flowers, such as Amaranths of all kinds, Balsams, Salvias, Double Portulacas, Cannas, Coxcombs, Zinnias, etc., should not be sown before April in the hot-bed, or if in the open ground, in this latitude, not before May 15th.

The Clematis.

BY AL FRESCO.

Like most enthusiastic amateurs I have my floral favorites, and one of my greatest pets is the Clematis. My impression is, that I was the first to import the new varieties raised by Mr. Jackman, and I well remember the pleasure it gave me to escort the editor of the *Agriculturist* to inspect the first blooms. After several years' experience, I must confess that my love for these beautiful climbers increases. Daily, during the course of last summer, carriages were stopped in front of my residence in order that the occupants might feast their eyes on the gorgeous mass of flowers, that in some places entirely hid the foliage from view. To me it was a source of pleasure to listen to the remarks and exclamations of those who were capable of appreciating the beautiful.

My practice is to plant a number of varieties in a clump, and by adopting this course the flowering season is prolonged. One circular bed four feet in diameter, contains *Clematis azurea grandiflora*, *C. Standishii*, *C. Jackmanii*, and *C. rubro-violacea*. The bed which has given me the greatest satisfaction contains *C. rubella*, *C. Lady Bovill*, *C. Prince of Wales*, *C. Jackmanii*, *C. rubro-violacea*, *C. Standishii*, and *C. azurea grandiflora*. "Tut! tut!" some of your horticultural readers will exclaim, "you planted too many in a four-foot bed." My answer is that the soil is nearly three feet in depth, and composed of two parts decayed turf and one part decomposed manure. During very dry weather, holes are carefully made between the plants, and these are repeatedly filled with water until the entire soil of the bed is thoroughly soaked. A few days before the first flowers open, the bed receives a good watering with liquid manure, and as a response to generous treatment a trellis six feet high and three feet diameter at the base presents almost a perfect mass of color for weeks, some of the blooms ranging from five to six inches in diameter. The Clematis will thrive in almost any soil or situation, but will amply repay the planter for any extra attention. In England the Clematis has been highly recom-

mended as a bedding plant. To test this matter I planted a number of the single species and varieties and among the double flowered ones, *C. Fortunii* and *C. Veitchii*, but the result has not justified the labor of preparing the soil and weeding the bed. The varieties of Clematis will bloom freely the first season they are planted. In April, '72, I received a number of plants from England, and when the case was opened I found that they had made a growth of several inches, and had developed flower buds. The young wood was removed, and they were planted out, and before fall favored me with numerous flowers. Each spring the owners of villa gardens spend many dollars in the purchase of Heliotropes, Geraniums, Fuschias, Lantanas, etc., which produce but few flowers, and are destroyed by the first frost. If they could be induced to cease the purchase of the plants referred to, and devote the amount expended for two or three years to securing one or more clumps of the Clematis, they would be rewarded for their venture. The Clematis is not the plant of a season, but improves in size and blooming capacity year by year. The branches of the Clematis are slender and easily broken by the wind. The plant has no tendrils, nor does it twine, but clings to supports by means of the leaf-stalks, which coil themselves around small objects. My favorite trellis for this class of plants is the top of a cedar tree, or bush, about six feet in length. I carefully remove the bark and shorten the branches so that it has a pyramidal form. When dry, I give it one coat of lead colored, and two coats of green paint. Before planting the Clematis, I obtain a chestnut, oak, or a cedar post, four by six inches, and three feet long. This post is firmly placed in the center of the bed and about six inches allowed to remain above the surface to which portion I firmly nail the cedar bush. To assist the young plants, I firmly place close to each plant a stick about one inch square, the top of which is beneath the surface of the ground. To each stick I attach a piece of about No. 20 copper wire and fasten the other end to the top of the brush. I find this brush and the wires to afford all the assistance the plant requires.

When frost has destroyed the foliage, I remove all dead wood and leaves, and carefully tie up what remains. To the inexperienced it will at first prove troublesome to determine what to leave and what to remove, but a careful examination will show where well developed buds exist, and the wood must be cut back to such buds. The wood of Jackmanii, rubro-violacea and allied varieties, dies back to within one to three feet of the ground, and the flowers of these are usually produced at the extremities of vigorous growths of the same season's production. The wood of Standishii and azurea-grandiflora is persistent and the flowers are mainly produced from small branches which grow from the old wood, and in consequence care is necessary to protect the last season's wood from injury. It is very small and brittle and easily broken, and requires care in handling. Jobbing gardeners usually trim all plants by rule, and I would advise the cultivators of the Clematis to keep these necessary evils from applying their rule to this tribe of plants.

The Clematis presents a fine field for experiment. Many of our native species are very ornamental, more especially the herbaceous section, and are capable of great improvement by hybridization. Hybrids are apt to sport from

seed, and I would advise all to sow the seed of the hybrid varieties, for some remarkable new ones may be obtained by adopting this course. Those at present under cultivation are allied in colors to the parent stock—blue, white, purple, and pink being the prevailing tints. What we require is a scarlet or crimson colored variety, and the raiser of seedlings may yet be rewarded by securing the prize. A scarlet or crimson colored Clematis with flowers the size of Lady Bovill, would prove to be the most ornamental garden plant possible. By careful selection and the annual production of seedlings, the result may not be far distant. In raising seedling Clematis, the experimenter will require patience, for the seed requires twelve months to vegetate, and under favorable circumstances the seedlings will not bloom before the autumn of the second year. From my experience, I can but say that several of my seedlings have rewarded me for the exercise of patience and perseverance, although a crimson variety has not rewarded my efforts.

Yucca or Bear Grass and its Uses.

If there is anything we like it is to meet a man with a horticultural hobby. We ought to be doubly gratified in the case of Col. Jas. T. Worthington, of Chillicothe, O., who has two hobbies, which he has rode very successfully for some years. One of these is to show that figs can be grown in Ohio, in the open ground, and the other is to utilize the Yucca or Bear Grass. We some years ago called attention to Col. W.'s estimate of the value of this material, and now having another letter from him we renew the subject. The common *Yucca filamentosa*, the Bear Grass or Adam's Needle, is a very common plant in our gardens, where it is cultivated for its subtropical foliage and its enormous clusters of white lily-like flowers. The kind grown by Col. Worthington has been by some botanists considered as a distinct species and called *Yucca flaccida*, but our best botanists regard it as a form of *Y. filamentosa*, with longer, more abundant, and less rigid leaves. The leaves of this, when properly cultivated, are three to four feet long and one to two inches wide; the plants grow so vigorously that in three or four years they form stools covering a space about four feet square and furnishing a great abundance of leaves. The flowers are very similar to the form so common in our gardens. In regard to the uses of this plant Col. W. writes: "For supplying cheap, strong strings and bands it has no equal; is excellent for tying up bacon, hams, corn shocks, vines, bundles of vegetables, mending baskets and other purposes when string or band is needed, and requires only to be known to be generally cultivated. The leaves of this plant will, I think, be eventually used for cordage, matting, and coarse cloths, instead of jute and other fibrous materials which we now import."

Experience with Tomatoes.

[The following garden record comes to us from Steel Bros., Laporte Co., Ind., which is not only interesting as an account of the performance of the different varieties in their locality, but as an example which may well be followed by those who would make a fair comparative test of tomatoes or other vegetables. This is, of course, a local experience, and as such is valuable, but we can point to cases in which both the Arlington and Canada Victor

made a much better showing—in fact, were equal to any.—ED.]

April 9th, planted under the same sash of hot-bed seeds of Trophy, Arlington, "extra-selected" Canada Victor tomatoes. We only got eight plants of Canada Victor.—May 2d, set out eight plants of each kind, in boxes six inches square filled with one half sandy soil and one half well-rotted manure, in a fresh hot-bed.—May 28th, set the plants in the open ground, in rich sandy soil, but without manure this year.—July 23d, picked the first tomatoes. The table below will give the result of all the pickings:

	Trophy.			Arlington.			Canada Victor.

August 21st, we had the most severe hail-storm ever known in this part of the country. It cut the tomato-vines so badly that we had very few afterwards. The pickings the next day were very much bruised. Some parts of our patch partly recovered, but none of the specimen plants ripened a perfect tomato after the hail. Owing to the cool, dry season tomatoes ripened very slowly this year. At the last of the pickings the Trophy was just beginning to ripen up well. The Arlington was apparently just in its prime. The Canada Victor was almost done bearing, and would probably not have lasted two weeks longer under any circumstances. The Canada Victor is early, but altogether too small for market, averaging only a little over three ounces. Probably one half were too small to sell at all. The Arlington is not quite as early, but larger, averaging almost five ounces, and very few very small ones. The Trophy is quite as early as the Arlington, and very much larger, averaging almost seven ounces. Every one must draw his own conclusions from this showing. We shall try all three varieties again next year, but shall not plant many of any except the Trophy.

FORCED PLANTS.—European florists force plants for commercial purposes much more than ours do, although ours are enlarging their operations in this respect. Last year there were many more thousands of the Lily of the Valley forced than the year before. With the French gardeners much attention is given to forcing the Lilac. Houses are built for the purpose without glass, as the forcing is done in the dark in order that the flowers may be white. Plants that have been forced are a long while in recovering. In small gardens, where space is valuable, it will hardly pay to try to resuscitate them. Hence garden plants that are forced into bloom for sale in the market and by peddlers are nearly useless to the purchaser until they have grown a year.

The Rock Tunica.—(*Tunica Saxifraga*.)

In forming a collection of herbaceous perennial plants with a view to determine their adaptability to our climate as well as their ornamental value, we have in the course of several years cultivated hundreds of species and varieties. Some of these die out of themselves, others after a fair trial are thrown out, while

the garden. It keeps on blooming for several months. The engraving was made with a view to show the size and shape of the leaves and flowers rather than the habit of the plant, which is not here represented. The delicacy and lightness of the flowers render them especially useful in bouquets for vases and the like, as they give a grace that is often wanting in such bouquets. If we wished, we could easily pro-

plant does not belong to the family of the clover and pea. The flowers are yellow, with four petals and six stamens; the pistil is curiously raised upon a stalk, a character which with others shows the shrub to belong to the caper family. The pod is more than an inch long, and contains several seeds the size of a small pea. Nuttall first described this shrub, and called it *Isomeris arborea*. *Isomeris* means

ROCK TUNICA.—(*Tunica Saxifraga*.)THE CALIFORNIA ISOMERIS.—(*Isomeris arborea*.)

there remain a select few which we not only keep for their excellence but propagate for the purpose of exchanging with our friends. One of the plants we would not willingly part with is the Rock Tunica, *Tunica Saxifraga*, which though not at all showy has many good qualities to commend it. The plant is a native of the Alps and Pyrenees, but, unlike most truly Alpine things, it makes itself at home in almost any situation. We have it in the very light sandy soil of an open border, where it is not in the least injured by the heat of summer or the cold of winter. The habit of the plant is exceedingly neat; it has small, linear, bristle-like, stiff leaves of the size and shape of those shown in the engraving; its stems are prostrate and branching, and it forms cushion-like tufts of foliage a foot or more across and but a few inches high. From among the tufts of leaves arise the slender, much branched flower-stalks, which are about nine inches high, and bear a profusion of pinkish flowers of the size shown in the engraving. The individual flowers are in themselves not showy, but they are produced in such abundance upon flower-stalks that are so slender and thread-like that the flowers almost seem to be floating above the plant, and thus make it a noticeable and pleasing object in

pagate the plant by division, but it multiplies itself so freely by self-sown seeds that there is no need of taking the trouble. Late in summer or in early autumn seedlings will be found springing up around the plants by thousands, and we have only to prevent them from being hoed up as weeds to have as large a supply as we wish. The name *Tunica*, which means a coat, has reference to the small bracts which form an involucre around the calyx; the specific name *Saxifraga* indicates its resemblance in habit to some saxifrages. It belongs to the Pink Family.

A California Shrub—Isomeris.

Those who have visited the southern portion of California can not have failed to see a large shrub or small tree quite unlike anything they have known in the eastern states. It has a peculiarly sad-looking foliage of that grayish green color so common to plants in arid countries. The leaves being three-foliate would lead one to suppose that he had come across some relative of the clover, an idea that would be borne out by the pea-like pods. But an examination of the flowers would show that the

equal parts, and it was probably given for the reason that the stamens and petals are equal in length, while in related plants they are unequal. The leaves and all parts of the plant have a singularly heavy and unpleasant odor. The stem, which is often as large as one's arm, is yellow within, and the wood quite hard. Our correspondent, A. M. Gass, Esq., of San Diego Co., Cal., sent us some seeds last spring; these germinated readily, and during the season the plants reached the height of about two feet, and were flowering freely when the frost put a stop to them. Although this is a botanically interesting plant, and noticeable in its native localities, we can not commend it for cultivation as its other qualities do not compensate for its disagreeable odor. We figure it because of the frequency with which it has been sent from California for a name.

SAUCER PROPAGATION.—We have explained this several times, but correspondents still ask about it; one has some grape cuttings and wishes to know if he can start them by saucer propagation. No. This is only suited to very young, soft wood. A saucer of sand, kept constantly wet, has the cuttings of young shoots stuck in the sand and exposed to full sunlight.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

About Earth-Closets.

Those who live in properly sewered cities give but little thought to the disposal of waste matter. Each house connects with the main sewer, and all offensive substances are carried off at once. In villages the accumulations of the household are usually deposited in vaults which are emptied yearly or less frequently, while upon farms it is very often the case that the provisions for getting rid of effete matter are often not only inadequate, but it is stating it mildly to say that the whole arrangement is a positive nuisance. It is more than a nuisance; it is often a crime. This is a subject that is not often discussed for the reason that it is not a pleasant one, but it is of so much importance that we can say that in many cases it is a matter of life and death. The great prevalence of typhoid fever in agricultural districts as compared with cities is traced directly to the general carelessness in disposing of that deposit which for the want of a better name we call "night-soil." That many privies are in dangerous proximity to wells is a fact so well established that we do not propose to discuss it here. A remarkable instance of the danger resulting from this state of things is cited in *Ogden Farm papers*, No. 46, in December last, page 449, to which our readers are referred. The object of the present article is not to show how privy vaults may be properly built and safely placed, but to impress upon the reader the fact that there is no need of the privy, as now used, at all. The health of the household is usually in the especial care of the mother, and here is one matter in which she can exercise her power for good in establishing an important reform—a reform not only of the greatest moment from a sanitary point of view, but one which will add much to the family comfort. It is a fact that any one who goes about with the senses of sight and smell ordinarily acute, finds it is the exception to come upon a farm privy which is not offensive to one or both of these senses—an evil that is crying loudly for a remedy. The amount of labor required to remedy this state of things is but little, and the expense almost nothing. We wish every one knew the virtues of dry earth, not dry sand, but good loamy earth, and the more clayey the soil the better. By *dry* we do not mean not positively wet, but absolutely dust dry. In summer this is easily secured by laying down a platform of old boards, scraping up the dry surface soil and throwing it upon the boards in a thin layer. It will become perfectly dry in a few days, when it may be sifted and be stored in a dry place for use. In spring this can not so readily be done, but take the driest earth that can be found, spread it on boards under a shed or in any covered place,

of the kind already referred to, and of assuring safety from all diseases communicated by human excrement. Those who have never tried it will be surprised to see how small a quantity of dried earth or coal ashes will render a deposit entirely inodorous. The main thing is to secure the absorbing material; the how of using it is of very little consequence so that each deposit is at once covered with it. Patented appliances are sold for letting a supply of earth or ashes upon the deposit in various ways. These are very excellent, and worth what they cost to those who can afford the expense.

the deposit. Figure 1 shows the commode closed, and figure 2 gives the same open. Figures 3 and 4 are sections showing the internal arrangement and the action when the cover is shut and open. The inventor describes the working of the apparatus as follows: "To feed the commode raise the lid *a* of the ash-box, which forms the cover of commode (or closet), and contains the screening apparatus, *c c*, and throw in the refuse just collected from under the fire grate; fasten down the lid tightly, and when you wish to use the commode raise the cover, as in fig. 4, the mere doing of which

causes a certain quantity of ashes to pass over the screen, the finer portions, *a d*, dropping through the screen, fall upon a shovel or distributor, *e*, and the cinders, *D*, roll over the screen down the sloping board *C*, and into the drawer *E*, to await removal for re-burning. After using the commode, pull down the cover (as in fig. 3), when the shovel *e*, before at the horizontal, now falls to the sloping position, throws the fine ash which rested upon it over the soil in the receptacle *f*. The partition of tin, *B*, when the cover was upright, held any fine ash that would otherwise have mixed with the unriddled again; but now throws it off, so that at the next use it will slide down

Fig. 3 and 4.—SECTIONS OF COMMODE.

The machinery is patented, but dry earth and coal ashes are not, and any one can contrive a box or other receptacle for the deposit, and have at hand a quantity of the earth or ashes with a convenient scoop, and accomplish the end without the aid of any machinery whatever. The end is to cover each deposit with the dry material, and if it is regularly done the privy will cease to be a nuisance. Existing buildings and vaults may be arranged for this—first, of course, removing all previous accumulations. Or a place may be arranged in any shed or out-building, and no matter how near the house it may be, if each person does his or her duty, it will be the cause of no offense whatever. But *note this*: no slops of any kind must be emptied into the receptacle of any earth-closet. If this be done the whole affair is ruined. While the earth-closet is a great blessing for general use, its inestimable value is shown when there is sickness in the house or where there are invalids or delicate persons who are unable to go out-doors. For house use there are commodes of various styles and by different makers, and all agree in the principle of throwing down a quantity of dry earth or coal ashes, though they accomplish the end by different mechanical means. We use the one first made in this country, by the Hartford Earth-Closet Co., and have had it some five years, during which time it has been entirely satisfactory. In the house the earth or ashes may be used by hand, the same as already mentioned, but, besides being more compact, it saves trouble from dust to have a closed apparatus of some kind. The different patented commodes are not very expensive, but one who is ingenious in such matters can readily contrive some affair that will answer the purpose. We recently saw in the *English Mechanic* engravings and description of a commode which was intended to both sift the ashes and apply it. We are not sure that this is advisable, but we give the illustrations more for the purpose of furnishing hints to those who would construct something of the kind than as a pattern to be followed. The inventor states that it is not patented, and does not conflict with any of the closets patented in England; how it may be with those in this country we can not say, but as there is no machinery about it we doubt if a thing like it has been patented here. In this closet or commode the cover is made large enough to receive the cinders as they come from the grate, and by the operations of lifting and shutting it the ashes are sifted out and at the same time made to fall upon

with the rest into the shovel. The wooden stage *A* acts in the same manner, and serves to measure the ashes that pass over the screen at each use. (See fig. 4 for the way in which it holds back the bulk of the ashes, *b b*, and fig 3 for the manner in which the measuring is done.)"

We can not too strongly commend 't' is matter to the careful consideration of every mother and father who reads these pages. We may add that the deposits from such closets may be used upon land, though their fertilizing value has been over-estimated. Still they are worth using on any farm crops. Remember that the earth must be *loam*, and *not sand*, and if ashes are used as an absorbent, they must be from *coal* and *not wood*.

What Shall we Have for Breakfast?

BY MRS. THOMAS S. ROBBE, NEW IPSWICH, N. Y.

- SUNDAY.—Fried oysters or clams; hot white rolls.
- MONDAY.—Broiled smoked halibut or salmon; baked potatoes; graham rolls.
- TUESDAY.—Beefsteak; fried potatoes, and milk toast.
- WEDNESDAY.—Fried sausage cakes; baked potatoes; corn rolls.
- THURSDAY.—Beef toast; buckwheat cakes.
- FRIDAY.—Mutton chops; baked potatoes; fried hominy.
- SATURDAY.—Fish balls; brown bread toast; bread fritters.

FRIED OYSTERS OR CLAMS.—They should be drained over-night. Dip them in pounded cracker crumbs and fry in hot fat. [These can only be had in perfection by those within easy communication with the coast, although in winter oysters go a long distance in good condition in sealed cans.—ED.]

SMOKED HALIBUT OR SALMON.—The fish should be put in soak the night previous. To avoid the disagreeable smoke which results from broiling on the top of the stove, it can be placed in a hot oven, on a bake-pau well buttered, and covered with another bake-pan. It will soon brown, and should have a little butter and pepper put on it before serving.

SAUSAGE CAKES are much nicer than the ordinary sausage, and are easily prepared. The meat being chopped and seasoned according to taste, it is made into little cakes, as fish-balls are made. They will

Fig. 1 and 2.—EARTH COMMODE.

and then thoroughly dry a small quantity at a time in a shallow box placed under or behind the kitchen stove or wherever else it may dry and not be in the way. Those who keep plants know to their sorrow how quickly earth will become dry if put where it can absorb no moisture. Any one who sets about it can get a sufficient supply of dry earth at any time when the ground is not frozen hard. Then the blessed discovery has been made that coal ashes—of hard or soft stone coal—are about equal to dry earth for sanitary purposes, and we may make ashes, formerly a nuisance to be got rid of, a blessing in the household. Secure a good supply of finely sifted dry earth or of coal, *not wood*, ashes, and you have the means of remedying all nuisances

keep a long while in a cold, dry place; but if a large quantity be made at once it is well to have it pressed hard into bags of strong cotton cloth.

BEEF TOAST is prepared by chopping fine the remnants of beefsteak or cold roast beef. It should be warmed up with a little water and seasoned with butter, salt, and pepper. Slices of bread should be toasted and laid on a platter on which the meat is to be turned when hot.

BREAD FRITTERS are made by soaking bread-crumbs in milk over-night. In the morning add an egg and salt and very little flour, as the thicker the batter is made by the crumbs the shorter and more delicious they are.

The lady who sends the above advises, as do the others, that all possible preparation for breakfast be made the night before.

Home Topics.

BY FAITH ROCHESTER.

MISTRESS AND MAID.—I can not wonder at all that refined American girls shrink from going out to service in families. But what girl who works for a living, as sewing girl or shop girl, would not find a happier lot in the kitchen of Mrs. Sin Saxton Scherman (see "Other Girls," by Mrs. Whitney), especially with such a work-fellow and room-mate as Bell Bree or Kate Seneerbox? Better still to be housemaid for Miss Louisa Alcott, the author of "Work." I read lately some of her experience with American help contributed by herself to the Boston Transcript. It is better than anything she can say in fiction upon the subject. I was especially delighted with the terms she made with the helpers she employed. If I had not sent away the paper containing the article I would venture to quote *verbatim*, although I know the editor would cut it out, as he insists on "original" matter—as if anything ever was original.

She frankly stated what sort of work she wished done; she wanted some one to work *with her* in the kitchen, taking at the same time the brunt of the labor. She wished an intelligent, respectable woman, who could make one of the family, sitting at the table with them, and reading their books and newspapers. She found just such companionship and help as she desired, in more than one case, and can not possibly supply all the applicants that now come to her for a situation, as she can not afford to give up her own share in the household gymnastics, so essential to her health.

I think the great secret of Miss Alcott's success with American helpers lies in the fact of her having outgrown, or having perhaps failed to inherit, the spirit of *caste* which mars nearly all human relations so far in history. Her helpers were never thought out of place in the parlor, though they were persons of sufficient refinement to leave the room when company called—just as you or I would do if boarding or visiting in Miss Alcott's family when visitors called to see other parties, unless we were invited to remain. Miss Alcott never hesitated to introduce her help to guests, when they fairly met, as "Miss So-and-so," not just "Jane," or "Mary." In short, she treated her help as one lady treats another lady. She paid no exorbitant wages, but gave the women who worked faithfully for her three dollars per week and a warm (*soul-warming*, I mean), comfortable home, where they were free to enjoy all the luxuries and refining influences of that home like its other inmates.

GETTING AWAY FROM THE CHILDREN.—When a baby is too young to reason with at all, it may be best to put on your bonnet in another room, and save it if possible from all thought of your absence until your return. But I have found it the best way usually to give the little ones an affectionate good-bye when I leave them for an hour or more. It is only treating them fairly, and they appreciate your confidence in them. Sometimes one will set up a cry to go too, when it is not a part of your plan to have its company; but you have only to refuse firmly—the more emphatically the louder it cries. It usually takes more than one lesson to teach a child that it can not conquer you by scream-

ing. Many children do gain their wishes in that way. Last summer I heard a child of four crying to go down town with her father. I heard him say petulantly more than once, "No, you can't go"! She only screamed the louder, and at the last moment he said, with the air of a vanquished man, "Well, get your bonnet and come along then." That child knows how to gain her point with her father, who regards her as a very willful child. A few weeks afterward the same little girl's mother came along past a group of children, and her own child skipped out to meet her. The mother had her hat under her shawl. She gave the little one some errand into the house, and then ran fast around the corner with the friend who accompanied her, saying to me, "I am going to meeting and I don't want her to go." The little one came out in a few moments and inquired for her mother. I called her to me and said, "Your mother has gone to meeting. She was afraid you would cry to go with her if she told you; but I am sure I can tell her when she comes home that you did not cry at all." She went back to her play without any complaint, and the mother seemed surprised when I told her about it next day.

FOOD FOR EXPECTANT AND NURSING MOTHERS.—I find many excellent things in a book called "The Philosophy of Eating," by A. J. Bellows, M.D., late professor of chemistry, physiology, and hygiene. To set a few thoughtless mothers to thinking, and to save their families from some sickness, and death perhaps, let me give the substance of a portion of the volume. He says in effect that the milk of the cow was intended to develop the calf, a work which it does perfectly; but if the calf were fed on cream alone or on butter it would very soon die. Butter can not develop a human being; and yet how many expectant and nursing mothers thoughtlessly provide themselves and their precious little ones with food largely consisting of superfine flour, butter, and sugar, without knowing or thinking that sugar and butter have no elements at all for muscles or bones or brains, and white flour very little.

Children, if their mothers fed exclusively on such food, would die within a month; and as it is, according to Dr. B., only one half in all Christendom and not one eighth in all Heathendom have vital power to carry them through the first five years. Those that live have a life of struggle with disease and suffering in just the proportion as they are deprived of food containing elements adapted to develop the whole system, and give power to resist and overcome disease. He states, what all thoughtful persons know, that most of our food contains an undue proportion of carbon. The butter, fine flour, and sugar which form so large a portion of our diet, consists largely of carbon, and this he considers renders all organs more susceptible to inflammatory and other diseases; while the deficiency of the nitrates and phosphates is another fault in such food. Animals in their natural state, living as they do according to natural laws, as a general thing raise all their young to full maturity. A physically perfect young man or woman, with perfect teeth and sound lungs and well-developed muscles and brains, is a rare exception to the general rule, and this he ascribes to improper food. Mothers' milk, if the mothers live on proper food, is the best as it is the natural food for children until teeth are formed, which indicates a condition that requires a change; but sickly mothers, those mothers who live on white bread and butter, would greatly benefit their children by weaning them and substituting the milk of the cow for their own poor product. The cow furnishes milk with too much nitrogenous matter. For this reason we, for young children, dilute it with water. As to other food than milk, that which will supply nourishment for the muscles and brain should be selected; but starch, arrowroot, sugar, and cream, all of which are sometimes given in ignorance of their character, contain no element of food but carbon; but, on the other hand, beefsteak and oatmeal, and such other articles as contain large proportions of nitrogenous and phosphatic elements, tend to develop the muscles and brain too rapidly; and a

special regard should be had to this consideration where the child is very active and precocious.

THE BREAKFAST QUESTION.—I am curious to see some of those best bills of fare sent in by the breakfast-getters of the *Agriculturist* constituency. I do not know whether they would help my case much. There are a good many difficulties in the way of solving this problem of a good early breakfast. First is the difficulty of waking up in time. Who wants to get out of bed and light a match to examine the clock on a cold winter morning? You lie waiting for it to strike, perhaps, and what if you have to count seven for your pains? Or you wait for a whole hour, and it strikes one, and by that time your blood is all in your head and your feet are cold. You have been writing articles for the press in the rare quiet of the hour—how clear the thoughts do come (and go!) just when there is no possibility of putting them on paper!—or you have the children's wardrobes all pulled to pieces about you, and can't sleep again until you see how they are all to be clothed for the coming season.

Then there is the fire to start. We have nothing to do on a winter morning but light the fire, all laid the night before in the kitchen stove, with the match and scrap of paper on the hearth.

The baby is always the unknown quantity in this problem. No one can tell at just what stage in the proceedings she will put in her claims for attention. If one woman has everything to do the time is a very busy and perplexing one.

I can not sleep comfortably if my mind is not made easy on the subject of breakfast materials before I go to rest. Steak to broil, potatoes all dressed for baking or boiling, plenty of bread in the house, coffee ready browned; that makes the problem not very difficult, especially if your husband, like mine, is ready to do a part—to broil the steak and make his own coffee, for instance, should any emergency arise such as is quite supposable where young children abound. Many nice things may be quickly prepared for an early breakfast if the preparation is begun the previous day; for instance, potato or fish-balls, meat, or meat and potato hashes, etc.

If warm bread must be made, graham gems take least time, provided your oven heats quickly. If the oven is hot when the raw gems go into it, you can take them out, done, in twenty or at most thirty minutes.

PROFESSOR BLOT CONCERNING BREAD.—We expect to find some directions about bread-making in our recipe-books. I turned to see what our celebrated cookery instructor would say, and found only this: "It is next to an impossibility to make good bread in a small family range or stove; four times out of five the bread is too much or not enough baked. Good baker's bread, besides saving a great deal of time and labor, is as cheap as you can make it at home." That is all! and it edifies me more than I can tell. But please tell us where to find our "good baker's bread."

That reminds me of a new recipe for yeast which I have just received from the best bread-maker I know of—my own sister. After all, perhaps I ought not to call her the "best bread-maker." The author of "The Philosophy of Eating" would call her very light, very white, very sweet bread, made of superfine flour mixed with new milk, poor stuff compared with almost any kind of graham bread, because superfine flour is such worthless stuff in his estimation. But if he saw the rye and Indian bread that always accompanies this beautiful white bread to the table he would feel better, for he highly commends rye and Indian bread. I hope sister will send me her recipe.

YEAST.—Two cups of grated potatoes; one half cup of sugar; one fourth cup of salt. Place these in a pan and pour over the mixture one quart of boiling water, stirring meanwhile. Place the whole on the stove and let it boil up once. When cool enough—about blood heat—add half a cup of good yeast. Set in a warm place to rise. It is very light and foamy, and does not sour readily. Like all soft yeast, keep it in a covered vessel as cool as possible without freezing.

BOYS & GIRLS' COLUMNS.

Some "Very Wonderful" Plants.

There are a great many curious things told about plants nowadays. Some plants shut up and droop their leaves when touched, and some time ago I told you about a plant that kept its leaves in constant motion whenever the weather was warm enough. Then there is the Venus's Fly-trap of North Carolina, that actually catches flies and other insects and appears to absorb their juices, or as we may say actually feed upon animal food. These stories about plants are very wonderful, and there are others quite as strange; but they are true, and any one who will take the trouble can see for himself that they are true. But our great-grandparents and their grand- parents were told stories about plants that were many times more wonderful than any that I have ever told you. When they were boys and girls, and were allowed to have a peep into the rare old books of their day—for children were not then of consequence enough for any Doctor

Fig. 1.—THE GOOSE-TREE.

Gray of the time to write about "How Plants Behave" for them, or any other Doctor to tell them about things in the *Agriculturist*; indeed they had no *Agriculturist*. People talk about the "good old times," but I think they must have been very stupid old times for boys and girls. Depend upon it, we live in the very best possible times. But we must not forget to tell about the wonderful things the boys and girls of the old times saw when they were allowed to look at the books. Just think of a "goose-tree"! Yes indeed, a tree which bore eggs for fruit, and which always grew conveniently near the water, so that when the fruit was ripe and broke open the little goose that was inside could fall into the water and swim away as nicely as could be. "You do not believe it?"—Well, here is the picture which plainly shows the whole thing. Yes, as strange as it may seem, this story of the way in which some kinds of water-fowl were produced was believed not by ignorant people alone, but the men of two and three centuries ago who were considered the most learned of their time gave full and minute accounts of the matter, describing the tree, egg, and bird, and even claiming to have seen the young bird within the egg. I know of three different books, each of which has an engraving showing the same thing each in a different way. You wonder how these people could have been so deceived; but you must recollect that in those early days

Fig. 2.—THE TARTARIAN LAMB.

there was much less known about plants and animals than at present. Many a bright boy and girl who reads this really knows more about geography than Columbus did, and so with other things our young people know better how to use their eyes than did even the learned doctors of the old times. It is believed that this whole story grew out of the fact that there is a salt-water animal, a kind of barnacle, which has a white shell-like covering that is shaped something like an egg, and is perhaps as large as a robin's egg. Each of these has a sort of stem, twice as long as itself, by which it is attached to a piece of wood or any other support. The animal within this shell has curious feelers, shaped something like a

hand with many long and delicate fingers. This barnacle seems to be the foundation of the whole story. Those who saw that the shell contained something alive did not use their eyes and examine the matter carefully, but took the fishermen's stories about their hatching out birds to be true. Quite as absurd is the "traveler's tale" of the Tartarian Lamb, a most curious thing which was part plant and part animal.

Fig. 3.—A FERN ROOT.

According to the story, this lamb grew upon a stem about three feet high, which was attached to it at the belly. When the little lamb wished to feed, all it had to do was to bend the stem over until it could graze away at the grass all around it. This was a very pretty arrangement, as when satisfied with eating it had only to rock and dandle away upon its stem, a thing that the lambs of the present day are unable to enjoy. To be sure the contrivance had its disadvantages, for when all the grass within reach had been eaten up the poor little thing could only "up and die," and how any seed was preserved for the next year's crop the few travelers who had seen the plant fail to state. As the Tartarian lamb was only found in the far-off desolate plains of the Volga, it was a long time before the real truth of the matter could be made out. If you would like to know what the little lamb was like, here is a picture (figure 2) of one from a drawing made of a specimen in the British Museum. Its fleece was got "as white as snow," like the celebrated one that "Mary had," but was yellow, and it does not look much as if, like Mary's lamb, it was "sure to go." Like the goose-tree, this lamb plant when properly examined turns out to be a very simple affair. The underground stems of some of our native ferns look very much

like the one shown in figure 3. Perhaps some of you have seen in a plowed clearing fern stems that are a good deal like the figure—I have, hundreds of them—as they are a long while in decaying. This stem grows along underground, and the leaves come up from it year after year. This Tartarian lamb was made from a similar fern stem, which is, as some of them are, clothed with long, coarse hairs. When all but four of the leaf stalks are cut away, and the thing turned upside down, it can, with a little trimming, be made into a good enough lamb to serve as a foundation for the story. If those travelers who brought home the tale of this wonderful lamb had been taught to use their eyes properly when they were young they would not have been deceived by such a stupid trick—at least so thinks

THE DOCTOR.

A Strange Bird.

You perhaps think that the bird in the picture is not a beauty, but no doubt its mother thought it one of the dearest little chicks that ever came out of a shell. It is said, you know, that "every crow thinks her own young the whitest," and it is likely that this fondness for one's own was shared by the mother Dodo. Yes, Dodo is its name—don't call it doodo, it should sound like "so-so."—Its scientific name is *Didus*, but you had better stick to Dodo, for fear you should get the names mixed and say "dido," which every youngster knows is a very bad thing to "cut up." Why do we tell you about the Dodo? certainly not on account of its good looks; but it is very interesting for a reason that we will try to show. You are aware that in some places, especially on the Connecticut river, the rocks show the footprints of enormous birds. These birds trod upon the sand and, being heavy, made a deep track; the water brought down more sand and filled up these tracks, and after many years the sand became hardened into sandstone, and those who get out the sandstone to build brown-stone houses, every now and then came across these enormous foot-prints, made longer ago than any of us can think. Then again in some parts of the country there are found the bones of huge birds, which were much larger and different from any living birds; yes, even the bones of birds with teeth were found last year. All this goes to show that at one time there were birds (as well as other animals) quite different from any that are to be seen now, and all that we know about them is what can

be learned from their bones, or fossils as they are called. In the island of Mauritius there are bones of a very large bird, but the bird itself is not to be found. Unlike the birds that were just spoken of as having lived so long ago, this bird of the Mauritius was known to be living less than 200 years ago. It was discovered by the Portuguese sailors but a few years after the famous voyage of Columbus, and was later taken to Europe, where its portrait was painted several times, and it was described by several writers. A head and a foot saved from a stuffed specimen are yet in the British Museum. There is every reason to believe that this bird, not an individual of which is known to be living now, and which we can only know from its bones, was quite at home on the island of Mauritius, and so abundant that the sailors used to catch them for food, though they found them rather tough eating. Here we have a case in which a bird, now found only as a fossil, has lived until very recent times, and that makes the bird a very interesting one, and helps us to see in our imagination a few ages back, when the huge Shanghai-like creatures took their walks along the sandy shores of the Connecticut valley. The name Dodo was probably given by the Dutch sailors. Five paintings of the bird were known to be in different galleries and museums in Europe, and a few years ago a sixth was discovered, which has recently been figured in the London Field, from which we borrow the picture. The bird has evidently some unpleasant thing sticking to its bill from which it is trying to remove it by the use of its claw. The Dodo was evidently not a very swift bird; the naked part of its leg was as big around as it was long; it could not fly as it had no wings to speak of; its body was covered all over with a mouse-colored down and it had for a tail and wings a few long feathers; it weighed about 50 pounds. Naturalists have been puzzled to know in what family of birds the Dodo belongs, but they now consider it to be most nearly related to the pigeons than to any others. What nice pets a coop full of pigeons like this would be, and what a lot of corn such a bill would devour!

Aunt Sue's Puzzle-Box.

NUMERICAL ENIGMA.

I am composed of fourteen letters.
My 9, 7, 12, 10 is to suffer.
My 1, 2, 3, 11 is an article of dress.
My 6, 4, 5, 8 is the outer part.
My 13, 14, 2, 6, 11 is a building.
My whole is the familiar name of a bird. **KATIE.**

HIDDEN COUNTIES.

- Oh! Ed, get off, or don't kick so.
- Smith's cottage was burnt last spring.
- I was surprised to see that fop open the door.

THE DODO'S PORTRAIT.

- Indeed, Sal, I need a new book.
- I am glad to hear that the lost ark was found.
- She works hard in the shop all day.
- The meal was as bitter as gall at Indiana.

The First Lesson in Rowing.

Can you swim? Yes, Miss, we mean you as well as your brother. We believe that both boys and girls should be taught to swim. Boys generally, if they live near the water, learn to swim without much teaching. If they can swim, then they can learn to row, for we do not think that a boy should be trusted in a boat unless he is able to take care of himself if he should happen to get overboard. It is not only useful to know how to row, but rowing is most capital exercise. It calls a great num-

TAKING HIS FIRST LESSON IN ROWING.—Drawn and Engraved for the American Agriculturist.

CROSS-WORD.

- My first is in tact but not in skill.
 - My next is in dose but not in pill.
 - My third is in noun but not in verb.
 - My fourth is in spice but not in herb.
 - My fifth is in part but not in whole.
 - My sixth is in heart but not in soul.
 - My seventh is in won't but not in will.
 - My eighth is in note but not in bill.
 - My ninth is in pink but not in blue.
 - My tenth is in one but not in two.
 - My eleventh is in knoll but not in hedge.
 - My twelfth is in pin but not in wedge.
 - My thirteenth is in blue but not in pink.
 - My fourteenth is in speak but not in think.
 - My whole is a city of well-known fame:
- Study the letters and tell its name.

BLANKS.

(Fill the blanks with words pronounced alike but spelled differently.)

1. He was ordered to — out the — of the church.
2. The — does not grow on the island of —.
3. Will you — a — of apples for the child?
4. The — was a man of mean —.
5. I am afraid this — will not agree with the young —.
6. The child began to — for the —.

ITALIAN BOY.

HIDDEN NAMES OF ANCIENT GRECIAN DEITIES.—

1. Venus. 2. Castor. 3. Saturn. 4. Cybele. 5. Doris. 6. Oceanus.

ORNITHOLOGICAL AMPUTATIONS.—1. Powter, tower. 2. Plover, lover. 3. Snipe, pine. 4. Ortyx, Tory.

All contributions for the PUZZLE-BOX should be addressed to "AUNT SUE," Box 111, P. O., Brooklyn, N. Y.

AUNT SUE'S NOTICES TO CORRESPONDENTS.

HANNAH R.—Thanks for your "contribution," but as it may be found in most of the unabridged dictionaries it is scarcely worth our while to publish it.

Thanks for answers, letters, etc., to O. A. Gage, Miles P. J., Mary C. S., Maggie Cator, J. E. Frahm, W. H. S. F., James H. G., and Mamie W.

A Corresponding Society.—

One of our boys writes that he thinks that a corresponding society might be formed among the farmers' boys which would result in great benefit to its members, and sends us a notice calling for the addresses of those who wish to become members and asks us to publish it. This is a question to which there are two sides, and we hope that "O. F." will not think us unkind if we decline to publish his call. In the first place he takes no measures to satisfy us that there is such a person as "O. F.," and we do not know—although we do not think it—but it is a dodge of some one to get the addresses of hoys all over the country. Secondly, we do not think such a proposition would meet the approval of parents in general. We should not wish a son to be in correspondence with a circle of boys of whom we know nothing whatever. A forced correspondence of this kind is not likely to result in much good. If "O. F." is desirous of improving himself let him get together half-a-dozen or more boys in his own neighborhood and form a young Farmers' Club. He will find it of much more use than a wide-spread correspondence with strangers you never have seen.

ber of muscles into play, and not only exercises the arms, but the chest and, in fact, the whole body. Rowing is now very popular with college students, and crews from a number of the leading colleges have a yearly rowing match, which is the occasion of much excitement. They carry a good thing too far, but even that is better than horse-racing. The boy is fortunate if he, like the one in the picture, has an "old salt" for a friend, who will teach him how to handle the oars. Of course great skill can only be had by practice, but you can get along much faster with a little showing. It is amusing to see what work those make who are unused to rowing; they lay out a great deal of strength to little purpose, and get more tired in fifteen or twenty minutes than a regular oarsman would in all day. Some men who live in the lake regions make nothing of rowing twenty miles or more from one point to another. The boy in the picture has "caught a crab." Perhaps you don't know what that means. When one misses a stroke and instead of pulling his oar against the water pulls it against the air he is very apt to lose his balance and tumble over, and this is what sailors and water-men call "catching a crab."

Writing for the Paper.—

A number of boys and girls have written us articles that they wish us to print. Now, we are always glad to hear from any boy or girl of our large family; you may be sure of that. But we must be the judge as to the printing. There are but few very young people who can write what other young people would care to read. It might please the writers to see what they have written in print, but we do not often get an article from boys and girls that we think should be printed. "But should we not try?" Of course you should, and the very first one who writes what we think the rest would be pleased to see will have the article appear in the paper. You who can not yet spell all the words correctly must not think of writing for the paper. First learn to write a plain and neat hand without making a single mistake in spelling; the time will be much more usefully employed than in writing things that you hope may be printed.

Life Insurance.

THE large majority of men do not accumulate. They live in the present. They take care of to-day's wants with to-day's means. They use their capital, forgetful that it may at any time be made unavailable by disease or accident, or swept away entirely by death; forgetful also that, as the years roll on and the palsy of age steals over them, that capital which they have in life and health will gradually diminish and its incoming interest grow less.

These considerations, to the man who has only himself to care for, are but trifling. He knows that so long as he is able to work he will be provided for, and that when death comes he will receive the last offices of the living—whether kind and loving or merely formal matters little to him. But he who has a family should bethink himself that he liveth not unto himself alone; that he owes a duty to those who are dependent upon him. Of the capital which he has in his strong arms and his trained intellect, only so much belongs to himself as is necessary, by its use, to provide himself with the means of living, and that which remains belongs to those whose natural protector he is. He has no right, if he can in any way guard against the contingency, to deprive them of their rightful share of the capital. He may guard against that contingency, if he shall live long enough, by saving his surplus till it shall reach a sum sufficient for their support. It is well—nay, it is his duty—to do this. But in the way of its accomplishment stands that ominous "if." To-day he is strong, capable, with a long life apparently before him. His capital and that of his wife and children is to all appearance as secure as though it stood in United States bonds. To-morrow the skeleton hand of the grim messenger reaches for him, and his strength is impotent, his skill is naught. The man's capital is dissipated! To himself this is nothing, for he has no earthly wants to be supplied; but to his family his death is utter bankruptcy. For them "the strong staff is broken," and they are helpless.

Just here the beneficence of life insurance is made to appear. By accepting the offer held out by the United States Life Insurance Co. of this city, the man whose capital is all in himself may continue that capital for the use of his dear ones. There is no other investment so safe as this, and none more profitable. The Company has proved its stability through the most eventful quarter of a century in the history of this country. Its plans are liberal; its management honest and capable; and its security beyond doubt.

The Best Water Pipe,

also the cheapest, when strength and durability are considered, is the **TIN-LINED LEAD PIPE**, made by the **COLWELL LEAD CO.**, No. 213 Centre St., New York. Price 16½ cents a pound. Descriptive Pamphlets sent by mail free.

S. B. Parsons & Sons offer at Flushing, N. Y., Rhododendrons and other Trees and Plants at less than cost of importation.

BANKING & FINANCIAL.

BANKING-HOUSE OF FISK & HATCH.
No. 5 NASSAU ST., NEW YORK.

We buy and sell GOVERNMENT BONDS and GOLD at current market rates; buy Gold Coupons; buy and sell Stocks and Bonds at the Stock Exchange on Commission, for cash; receive Deposits and allow Interest at the rate of four per cent; make Collections, and transact a general Banking and Financial business.

We also deal in the **CENTRAL PACIFIC** and **WESTERN PACIFIC GOLD BONDS**, which, at present prices, are very desirable for investment.

We are also selling the **CENTRAL PACIFIC GOLD SIX PER CENT LAND BONDS** at 85 and accrued interest.

FISK & HATCH.

The finest and richest chromo ever sent out by any editor as a premium. It is no "cheap daub" or "meaningless picture," as is proved by the unanimous verdict of all to whom it has been sent.

JOHN J. THOMAS, Union Springs, N. Y., writes: "The common practice of offering Chromos to subscribers has nearly had its day—third rate ones being chosen for the purpose because they can not be otherwise disposed of. This one, however, is a very different thing—good as a work of art, and brilliant and refreshing as a picture. The fine display of fruit which it represents makes it very appropriate for the readers of the *Fruit Recorder*, and I think all will be pleased with it."

From JAMES VICK, Rochester, N. Y.:—"FRIEND PURDY: Accept my thanks for your pretty Fruit Chromo. It is well executed, and will be appreciated by all lovers of fruits and paintings. Next year, suppose you give us a Chromo of popular Small Fruits, in which you take so much interest."

From J. B. ROOT, Rockford, Ill.: "We shall hereafter have choice fruit in the house the year round, for your Chromo is fully equal to nature—one of the finest pieces for the drawing-room I ever saw."

We have similar testimonials from such men as T. G. Yeomans, Thos. Moolan, Ellwanger & Barry, William Barry, T. C. Maxwell, and hundreds of other subscribers who have received it—most of them going into ecstasies over it. Out of the twelve thousand we have now sent the Chromo to we have not received a single complaint. We doubt if this can be said of many chromos sent out as premiums. We offer to refund the money and stop the paper if any are dissatisfied with the Chromo or paper and will return them to us. We have the entire control of this magnificent fruit picture, and it can only be had by subscribing for

"The Fruit Recorder & Cottage Gardener" for 1874, a monthly, at \$1.00 per year, or \$1.25 with the Chromo. Specimen copies of the paper sent free to all applicants. A single copy will satisfy any one as to its being the most practical paper printed on this continent for the fruit grower, flower fancier, and market gardener. Club agents say they have found nothing like it and Chromo to work with, and that no publisher offers more liberal inducements. All necessary papers sent to such as desire to work for clubs on application. We also send out a book of 64 pages, called "The Small Fruit Instructor," which tells in a plain, common-sense way just how to grow small fruits in abundance for family use and market. Price, post-paid, 25 cents. Address

(CIRCULAR.)

Consumers Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers Importing Tea Co.,

No. 8 Church Street,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D. C.

NEW POTATOES.

COMPTON'S SURPRISE.

Showing the product from a single eye in the grounds of F. SEILER, Veroua, N. Y., who raised 384 pounds from one pound of seed.

To the two popular varieties, **Extra Early Vermont** and **Compton's Surprise**, introduced by us last Spring, we take pleasure in adding two new varieties, **Snowflake** and **Brownell's Beauty**, as medium sorts maturing between the two, their equal in quality and productiveness—and the most beautiful varieties in cultivation. The great popularity of the **Early Rose**, **Peerless**, and others of Breese's seedlings first offered by us, and their general adaptation to the various soils and climates of the civilized world, have induced thousands in all parts of the country to experiment in raising seedlings, in hope of producing a better one, a large number of which have been sent to us for trial. After being carefully tested by ourselves as well as several of the most experienced cultivators in the country, the above named varieties have been selected, which we offer to our patrons, fully confident of their superiority.

In addition to the many valuable testimonials received from growers of the above varieties in our own country, the following favorable note is received from Dr. Masters, the talented and well-known editor of the **London Gardeners' Chronicle**, which shows the high estimation in which **Brownell's Beauty** and **Extra Early Vermont** are held in England:

GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE }
OFFICE, London, England, October 7, 1873.
GENTLEMEN: Last year you were good enough to send us for trial some of your new kinds of Potatoes. As a large trial of over 300 sorts was projected to be carried out at the

Royal Horticultural Society Garden, at Chiswick, this season, I thought the fairest way would be to send your samples to be tried with the rest. I sent them under numbers, so that no one but myself knew either the names of the varieties or the senders. I have now the pleasure of telling you that a **First Class Certificate** was awarded by the judges to your **Extra Early Vermont** and to **Brownell's Beauty**. No doubt you will obtain official notice of this ere long; meanwhile I thought you would like to know how much appreciated your potatoes were.

I am, gentlemen, your obedient servant,
(Signed), MAXWELL T. MASTERS.
To B. K. BLISS & SONS, New York.

Prices for **Brownell's Beauty** and **Compton's Surprise**.—
Per lb., \$1; 3 lbs. to one address, \$2, by mail, prepaid.

**ARE YOU GOING TO PAINT?
OVER 200,000 HOUSES**

PAINTED WITH THE

Averill Chemical Paint.

White and all the fashionable shades mixed ready for use and sold by the gallon.

EXTRACTS FROM OUR LETTERS.

HON. JAS. NEGLEY, Pittsburgh, Pa.: "Altogether I find the 'Averill' the cheapest and best."
 PETER HENDERSON, Esq.: "The 'Averill' has proved superior to lead and oil."
 C. W. SPOONER, Treas., Cordage Co., Plymouth, Mass.: "The 'Averill Chemical' has proved good."
 C. A. ALLYN, Esq., Palmyra, N. Y.: "The 'Averill Paint' is as bright to-day as when applied three years ago."

Hundreds of testimonials from owners of the finest residences in the country, with Sample Card of Colors, furnished free by dealers generally, and by the

AVERILL CHEMICAL PAINT CO.,
 32 Burling Slip, New York; or 132 East River St., Cleveland, Ohio.

**Carbonized Enamel
IS AS PURE AS GLASS.**

The Bridgeport Mfg Co.,
 OF BRIDGEPORT, CONN.

(Office, No. 88 Chambers St., New York), have the exclusive control of this valuable enamel, and are using it to cover all of their celebrated

American Submerged Force Pumps.

They also enamel pipe inside and out, which delivers the water chemically pure. The Enamel is composed of vegetable matter, baked on so hard that a blow does not break it, and it resists acids that eat gold.

Gentlemen: I have examined the sections of Carbonized Enamel Pipe submitted to me by you. It is superior to any pipe I have ever seen for resisting acids and conducting water from springs or for use in connection with pumps, etc. The Enamel adheres with astonishing tenacity, withstanding even heavy blows; and the surface of the metal where the enamel is beaten off seems to be protected against the ordinary action of water.

M. C. WELD,

Late Associate Editor *Am. Agriculturist.*

MUDGE & WOODS, No. 88 Chambers St., N. Y., are the exclusive selling agents of the Bridgeport Mfg Co. for the Licenses of States, counties, and towns rights for the American Submerged Suction and Force Pumps.

The Pulsometer or Magic Pump.

The simplest, most durable, and effective steam pump now in use. Adapted to all situations, and performs all the functions of a steam pump without its consequent wear and tear. No machinery about it. Nothing to wear out. Will pump gritty or muddy water without wear or injury to its parts. It can not get out of order.

C. HENRY HALL & CO.,
 20 Cortlandt Street, New York City.

GRAPE - VINES

OUR SPECIALTY.

TO FARMERS & PLANTERS.

DOUBLE REFINED POUDETTTE for sale in lots to suit customers. This article is sold for half the price of other fertilizers, and is cheaper for Cotton, Corn, Tobacco, and Vegetables than any other in the market. Price, delivered on board in New York City, \$25 per ton. Ask attention to the following testimonials:

CHARLES A. MESSENGER, Providence Co., R. I., writes: "The Double-refined Poudre I bought of you has given satisfactory returns, and I consider it the best of anything I can use for an early crop."

THOMAS W. LATHAM, Providence Co., R. I., writes: "I would rather have your Double-refined Poudre than any phosphate I ever used. Where I used it on Potatoes it was far ahead of any other manure."

L. H. SHELDON, Sup't of the New Jersey State Reform School, writes: "We have used Poudre for several years upon our farm crops, and for the money invested we have found nothing that has done us so much service."

S. J. KELLY, Burlington Co., N. J., writes: "I used Double-refined Poudre on Rutabaga Turnips alongside of Peruvian Guano and Hen Manure. Where the Poudre was applied the increase was thirty per cent over the others."

WILLIAM H. CADY, Ocean Co., N. J., writes: "I used Poudre on Corn, Sweet and round Potatoes, Onions, and Lima Beans. It brought forward my crops two weeks earlier. I think it the best manure I ever used, giving better results than Peruvian Guano, at much less cost."

VAN ANTWERP AND VAN BUREN, Montgomery Co., N. Y., writes: "Poudre has been used in this locality for ten years past, mostly on Corn, and those who have used it say they have from 1/4 to 1/2 more Corn by using the Poudre."

W. F. GERKIN, of Essex Co., N. Y., writes: "I have used the Double-refined Poudre for the last five years, and I consider it the cheapest fertilizer I can buy—giving the best results for the cost."

MILTON STRONG, Suffolk Co., N. Y., writes: "I gave Poudre a thorough trial this year, using it upon Corn, Potatoes, Lima Beans, Tomatoes, and Vines, and I have never raised better crops. My Corn will yield 100 bushels of ears per acre, and my garden was the surprise and admiration of all who saw it."

HENRY T. HORTON, Cheshire Co., N. H., writes: "I find, from experiments made last year, the Double-refined Poudre is the cheapest fertilizer to use on Tobacco. I put it beside Peruvian Guano with equal cost of both, and the Tobacco was 30 per cent better where I used Poudre."

W. H. REMINGTON, Hartford Co., Ct., writes: "I have used Poudre on Corn, Potatoes, and Tobacco. There was but one piece of Corn in the place equal to mine, and that had 30 loads of manure per acre and mine none. The Tobacco started as soon as set and grew luxuriant."

WM. S. POMEROY, of Hartford Co., Ct., writes: "I have used the Double-refined Poudre for several years on Tobacco, and I think it one of the best fertilizers made for this crop."

A Pamphlet giving full directions, etc., sent free on application to **JAMES T. FOSTER, 66 Cortlandt Street, New York.**

PRICES OF HAND MOWERS.
No. 1.—Width of cut, 9 in., \$15
" 2.—" " " 12 in., 20
" 3.—" " " 15 in., 25
" 4.—" " " 18 in., 30

The New EXCELSIOR is simple and durable. The gearing securely increased and will not clog. Has a full roller, without which no machine is perfect. A pawl ratchet (noiseless), needs no oiling. The front rollers are adjustable, to vary the height of cut. Open balance wiper—with steel knives—the only practical means of securing strength and ease of draft. Patent adjustable wrought iron handle, attached to each side of the machine, being much superior to the single wooden handle used in other machines.

THE FIRST DIVISION
OF THE
St. Paul & Pacific
RAILROAD COMPANY
OFFER THEIR
LANDS
FOR SALE

At moderate prices and on 10 years' credit, if desired, and also TOWN LOTS in Towns at R.R. Stations. They will also sell PRAIRIE LANDS at low prices on 3 1/2 years' time without interest, provided the purchaser will make satisfactory improvements.
GOVERNMENT LANDS
Are still to be had under the HOME-STEAD and TREE CULTURE laws near the lines of this Company; 240 acres can thus be secured FREE, except the regular Land Office entry fees.
The State of MINNESOTA pays a bounty of two dollars (\$2) each year for 10 years, for every acre of trees planted and cultivated, and two dollars (\$2) per year for 10 years for every half mile of trees planted and cultivated along any Highway.
For particulars, address
HERMANN TROTT,
Land Commissioner, St. Paul, Minn.
EDWARD D. ATWATER, Secretary.

Adams' Celebrated Universal GLASS CUTTERS

Warranted the best in market. They cut glass better than a Diamond. Are very simple and durable. Any one can use them, and everybody needs one. We make three styles: Putty Knife, Ruler, and Ornamental. Either one sent to your address on receipt of 50 cents. A liberal discount to Agents. None genuine but those manufactured by
B. F. ADAMS & CO., Springfield, Mass.

PRAIRIE, TEN MILES EAST FROM LINCOLN, NEB.

A FINE REPRESENTATIVE VIEW OF FARMS AND CULTIVATED GROVES ON ROLLING PRAIRIE.
IF YOU WANT A FARM OR HOME,
YOU SHOULD BUY OF THE

BURLINGTON AND MISSOURI RIVER RAILROAD CO.
 IN IOWA OR NEBRASKA.

- BECAUSE**—Their prices are low, ranging for the best land from Three to Ten Dollars per acre.
- BECAUSE**—No payments are required of the purchaser for four years, except interest at six per cent.
- BECAUSE**—After the fourth year only one seventh of the principal is payable annually till the whole is paid.
- BECAUSE**—You are not required to go into a wilderness, these being well-settled States, the population of which is rapidly increasing.
- BECAUSE**—The mildness of the climate and fertility of the soil is such that the settler can pay for his farm from the products raised upon it long before the time when the principal becomes due.
- BECAUSE**—Failure of crops from drouth is unknown.
- BECAUSE**—Large allowances are made upon fare and freight, thus giving low rates on both to purchasers of this Company's lands.

AND YOU SHOULD BUY THIS YEAR.

- BECAUSE**—Purchasers during 1874 who cultivate one-half their land within two years from their purchase are allowed a reduction of twenty per cent on its price.
- LARGE DISCOUNTS** also, FOR CASH, within One, Two, or Five Years.

Send for Circulars, with full information on all points, to

GEO. S. HARRIS, Land Commissioner,
 At Lincoln, Nebraska, for land in Nebraska. At Burlington, Iowa, for land in Iowa.
JAS. R. WOOD, General Agent, 59 Clark St., Chicago, Ill.

Or to **W. D. COWLES**, General Agent, 317 Broadway, New York.

BENJ. F. WELLS, Sole Agent,
 47 Dey Street, New York.

New Scheme of Easy Payments

FOR

MASON & HAMLIN

CABINET  ORGANS.

The MASON & HAMLIN ORGAN COMPANY have arranged a new system, under which they now offer their well-known Organs

For Rent, with Privilege of Purchase, at prices and on terms extraordinarily favorable.

Payments may run through one to four years.

All Rent which has been paid allowed and deducted on Organs purchased and paid for within one year.

An Organ may be returned after six months at cost of only reasonable rent, if for any reason it is not wanted longer. If an Organ be retained, and rent paid four years, it becomes the property of the party hiring, without further payment.

Organs will be rented on this plan to any part of the country accessible to our warehouses or agencies. Only knowledge of the unrivaled excellence of our Organs, and practical experience that they will be found so attractive in use that scarcely any of them will ever be returned, warrant this offer to supply them on such terms.

Terms of Renting, containing full particulars, with descriptions of Styles, Rents, and Prices; also, Illustrated Catalogues and Testimonial Circulars, sent Free. Address

MASON & HAMLIN ORGAN CO.
BOSTON, NEW YORK, OR CHICAGO.

The Rural Kansan

Published monthly, at Humboldt, Kansas, at \$1 per annum, contains 32 large columns, 3 columns to the page, and is the only publication in the country that has a large department devoted exclusively to

Land Question,

in which the laws, decisions, and rulings relating to the various Acts of Congress for the disposal of the public lands are published, and all questions of inquiry relating to lands in the West answered without charge.

It is invaluable to those desiring to avail themselves of the Homestead, Pre-emption, or other Acts of Congress.

Send 10 cents for specimen copy. Address

RURAL KANSAN, Humboldt, Kansas.

A SUCCESSFUL BOOK.—The *New York Evening Post* says: "We learn from the best authority that the amount paid to the heirs of William H. Seward for copyright of the first six months of *Seward's Travels Round the World*, was over *Forty-one Thousand Dollars*. The second six months began on the 1st of August, and the sale of the work continues constant and large. Such a profit for such a time is probably without a parallel in this country, if it has ever been equaled anywhere." * * * The above work makes a large and handsome Octavo of 800 pages, and 200 illustrations. It is sold only by Subscription, and is the best selling book of the day.

A few desirable Agents can secure good territory by applying soon to the publishers.

D. APPLETON & CO.,

DO GOOD

AND

MAKE

MONEY.

The Publishers of American Agriculturist and HEARTH AND HOME take pleasure in presenting in the adjoining Table, their new general Premium List for 1874. The Premiums which they have offered in past years have engaged the attention of a very large number of persons of all ages and both sexes. Many thousands have secured Premiums, and very many of these, who at first had small hopes of success, have been themselves astonished at the ease with which they have raised large clubs and secured valuable Premiums.

Here is pleasant and profitable work for all. Any one who wishes to do good and make money, can do both by going to work as here invited by the publishers of these two most valuable journals, American Agriculturist and HEARTH AND HOME. You need only to show specimens of the papers, promise the beautiful Chromos, which are now ready for delivery, according to the publishers' offer, and forward your subscriptions. TRY IT.

Explanatory Notes.

N. B.

Read and carefully

Note the following items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But... (b) Tell us with each name or list of names sent, that it is for a premium... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have any time, from now until July 1st, to fill up your list... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers... (f) Specimen Numbers, etc., will be supplied free as needed by canvassers, but they should be used carefully and economically, and where they will tell... (g) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd Company, or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk; otherwise it is not.

[In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 a year for American Agriculturist, and \$3.00 a year for Hearth and Home; also at the club rates of \$1 and \$2.50; also at the rates of \$1 a year for both papers together.] Description of Premiums sent free to applicants.

N. B.—In all Premium Clubs for either paper, TWO copies of American Agriculturist (English or German) at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the 2d and 4th columns, or from the 3d and 5th, or wholly from the 6th column.

Table of Premiums and Terms For American Agriculturist, and for Hearth and Home, for the Year 1874. Open to all—No Competition.

Table with 6 columns: (1) No., (2) Names of Premium Articles, (3) Price of Premiums, (4) American Agriculturist only, (5) Hearth and Home only, (6) Both Papers together. Includes items like Moore's Floral Set, Gold Pen, Revolving Pencil, Butter Cooler, Knives and Forks, Sewing Machine, etc.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 2 to 8, 27 to 33, 55 to 78, and 81 to 93, inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-offices or express office nearest the recipient) to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance desired. Description of Premiums sent free to applicants.

Up for Repairs,

A Beautiful, New Picture FOR EVERY SUBSCRIBER

TO THE American Agriculturist FOR 1874.

The great satisfaction which has been expressed by tens of thousands of subscribers to this paper who have received the picture entitled "Mischief Brewing," has led the Publishers to provide another beautiful Gift for their patrons for the coming year.

An exquisite Oil Painting by the celebrated American Painter, Mr. B. F. Reinhart, executed expressly for the American Agriculturist and entitled

"UP FOR REPAIRS,"

has been most successfully reproduced in Chromo by the well-known firm of Bencke & Scott. It is a picture of a scene in childhood, which many will recognize as what they have themselves witnessed or been actors in, and can not fail to please both old and young. The Chromo is so perfectly done as scarcely to be distinguished from the original.

The Publishers will give this beautiful Chromo

To Every Subscriber

to this paper for the year 1874 received after this date, as detailed below. It is ready for immediate delivery at 245 Broadway, Free of Charge.

If to go by mail, 10 cents must be sent to cover cost of packing and postage. For 25 cents it will be Mounted, Varnished, Packed, and sent Post-paid.

N. B.—The Chromo will be delivered: At the Office, Unmounted, Free. " " Mounted, 15 cents extra. Sent by Mail, Unmounted, 10 cents extra. " " Mounted, 25 cents extra.

We advise all to have them mounted before leaving the office, as in the large quantities we put up we are able to mount them for a quarter of the cost of doing it singly, and better than it can usually be done elsewhere.

The picture is designed for every subscriber upon the terms stated above, which please read carefully; and on these terms all are alike entitled to it, whether their names come singly at \$1.50 each, or in Clubs of Four for \$5, or Clubs of Ten at \$1.20 each, or in Clubs of Twenty or more at \$1 each. Subscribers in Premium Clubs will also thus be entitled to it.

N. B.—A few of the beautiful pictures entitled "MISCHIEF BREWING," which have been given to so large a number of subscribers, are still in stock, and, while any remain, subscribers to the American Agriculturist can have their choice between this and the new Chromo "UP FOR REPAIRS;" but the choice must be named at time of subscribing.

ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

Play and Profit IN MY GARDEN.

PEAR CULTURE

FOR PROFIT.

By P. T. QUINN,

PRACTICAL HORTICULTURIST.

ILLUSTRATED.

If one wishes to raise pears intelligently, and with the best results, he must know first the character of his soil, the best mode of preparing it, the best varieties to select under existing conditions, the best mode of planting, pruning, fertilizing, grafting, and utilizing the ground before the trees come into bearing, and finally, of gathering and packing for market.

The hope of furnishing practical information on all these points has induced the author to endeavor to draw for others the same lessons which years of practical experience have afforded him.

Contents:

Chap. I. Varieties.	Chap. IX. Varieties to Plant.
“ II. Aspect.	“ X. Pruning.
“ III. Preparation of the Soil.	“ XI. Manuring and Mulching.
“ IV. Distance Apart in Planting.	“ XII. Gathering Fruit.
“ V. Dwarfs and Standards.	“ XIII. Marketing Pears.
“ VI. Planting-Time.	“ XIV. Profits.
“ VII. Nursery Trees.	“ XV. Propagation, etc.
	“ XVI. Practical Suggestions.
	“ XVII. Orchard Record.

ORANGE JUDD COMPANY, 245 Broadway, N. Y.

THE BEST COMPANY

In which to obtain the Best Life Insurance upon the Best
Plan is (in our opinion) the **TRAVELERS INSURANCE
COMPANY**, of Hartford, Conn. Its rates are low, its
security is unquestioned, its management is prudent
and conservative, its reputation is first-class, it grants
life insurance of the very best quality upon rates and
conditions highly favorable to the insured. The con-
tract is plain and definite, without complication, mys-
tery, or uncertainty. The policy is always worth its face,
the premium never increases.

JAS. G. BATTERSON, President.
RODNEY DENNIS, Secretary.

CHAS. E. WILSON, Ass't Secretary.

GEO. B. LESTER, Actuary.

Agents everywhere.

RUPTURE.—Since the Elastic Truss, 683
Broadway, New York, which soon cures rupture, has
annihilated metal spring trusses, the finger-pad fellows steal
the name, and sell bogus elastic trusses, worthless rupture
belts, and stretchy "band trusses" to ignorant persons.
Beware of them. Highest medals at American Institute
and at the great Cincinnati Exposition. 28 branch offices.
Patronized by the Surgeon General and the U. S. Govern-
ment. This new truss is sent by mail at a cheap price, and
circulares furnished free by The Elastic Truss Co., 683 Broad-
way, New York.

INVENTORS Who wish to secure
PATENTS should
write to **MUNN &
CO., 37 Park Row,**
New York, for Advice and Pamphlet, 10s pages, FR12.

**PRETTY
MRS. GASTON,**

AND OTHER STORIES.

BY

J. ESTEN COOKE,

Author of "The Virginia Comedians," "Dr. Van Dyke,"
"Surry of Eagle's Nest," etc.

NOTICES BY THE PRESS.

The narrative is ever animated, and here and there touch-
ed with warm, tender, yet natural emotion. — *College
Cowan*, New Haven, Conn.

The principal figure of the story, the pretty widow Mrs.
Gaston, is well drawn and attractive, and the author has
displayed in the treatment of this character much care and
ingenuity. — *Boston Traveller*.

The style of Mr. Cooke's writings is smooth and fascinat-
ing, and whoever commences the perusal of them will never
regret the undertaking. — *Westfield News Letter*.

A romance with a most delightful complication of matrimo-
nial purposes, as well as having a villain, forger, gambler and
detective to assist in the action. — *Boston Post*.

The plot of the principal story is finely wrought out, full
of incident, and there is a sort of fascination about the style,
which claims the attention of the reader until the close. —
Salem Gazette.

A very lively and amusing book. — *Country Gentleman*.
The story is written in popular style—a little plot, a little
mystery, a little love—and is sure to attract a large number
of readers. — *Reading (Pa.) Eagle*.

Price, Post-paid, . . . \$1.50.

Calendar for May.

Table with columns for Day of Month, Day of Week, and sunrise/sunset times for Boston, New York, Philadelphia, Washington, and other cities.

PHASES OF THE MOON.

Table showing moon phases (Full, 3rd, New, 1st, Full) and times for Boston, N. York, Wash'n., Cha'ston, and Chicago.

AMERICAN AGRICULTURIST.

NEW YORK, MAY, 1874.

May is a busy month. In fact we know of no month in the year when a farmer can not find plenty of work that ought to be done. When we speak of winter being a season of comparative leisure, we simply mean that we can, if we choose, postpone our work for a few days or weeks. On a well-managed farm there is always work that can be done to advantage. Farmers often complain that their work is never done. We would not wish it otherwise. Without honest work there can be no honest pay. He that won't work neither shall he eat. How often does a man say, "if I could only get work I should be happy." A farmer need never say this. He is never in the condition of a briefless lawyer, or a minister without a charge, or a doctor without a patient. His store never leaks customers. His factory need never be run on half time. For this let us be thankful.

On our own farm, and we presume it is so on others, it is almost impossible to get ahead of the work. The seasons are short and the weather uncertain. The land is too wet to plow this week and too dry and hard to plow the week after. We must be prompt. We must be systematic and orderly. Plows, harrows, rollers, cultivators, drills, stone-boats, crow-bars, chains, spades, forks, wagons, carts, harness, bags, pails, baskets, ropes, whippletrees, elevators, bolts, monkey-wrench, ax, hammer, nails, and a score of other things that are likely or unlikely to be wanted should be all ready for use and just where you can lay your hand on them in the dark if needed. We must be ready at any moment to change from out-door to in-door work—to plow and harrow or grind hoes and oil harness; to draw off stones, sow plaster, build fence, dig, underdrain, or to eut feed, sort potatoes, repair tools, whitewash walls, or paint implements. To do all this without loss of time, and a hundred other things connected with good farming, requires a clear head, great patience, much self-denial, untiring energy, systematic and prompt industry, and constant personal supervision.

Hints about Work.

Horses need to be well looked after at this season. Much depends on their ability to do a good day's

work. They require not only good feed, but good digestion. Neither man nor horse can work well unless he eats well, sleeps well, and digests his food. Horses suffer more from indigestion than from any other one thing. At this season we are apt to keep them too many hours in the field. We know horses that are taken out to plow at six o'clock in the morning, are brought to the stable at noon, the bits taken out of their mouths, but the harness not removed. They are given a few ears of corn, and have some long, dry hay thrown into the racks; are again taken to the field at half-past one, and kept there until half-past seven at night. The horses are tired and exhausted when brought in at noon, and before there is time for the process of digestion to commence they are again put to hard work.

Three-Horse Teams are becoming more and more common, and can not be too earnestly recommended. A man can drive three horses as easily as he can two. Where it takes the strength of one horse to draw the empty wagon, three horses have double the effective force of two horses.

Plowing is often hard work. This is especially true in striking out the first furrow. In sod land we should always put on three horses, or else strike out a light, narrow furrow. On stubble land we throw up a light furrow and then turn it back again. This plows the whole land and does not overtax the team.

When the Horses are Brought Home at Noon give them a pail of water with a pint of corn or oatmeal stirred in it. Take off the harness. Wash the shoulders. If sweaty, rub them dry with straw, curry off the mud and dry sweat, and rub them down with a brush. Then feed them, and let them eat while you are at dinner.

Better Grooming in the stable and less idle time in the field is what we aim at on our own farm.

Cut Feed, moistened with water and mixed with meal and a little bran, can be eaten more rapidly than long hay, and leaves more time for rest and digestion. We mix a bushel of cut hay, four quarts of corn-meal, and two quarts of bran together, and let the horses have all they will eat of the mixture, and give them a little long hay in the racks.

Keep the Mangers Clean and Sweet.—As soon as the horse stops eating the cut feed remove all that is left from the manger. This is very important. Give a little salt in the manger every day. The horses will not eat too much if they have it regularly.

For Chafed Shoulders wash with warm soft water and castile soap and then dress with crude petroleum. If ulcerated, wash them with carbolic soap and apply petroleum afterwards. If possible, let the horse rest a few days.

Planting Corn is the important field work of the month. Corn is not likely to be as low next year as it has been for a year or two past. We think it a good time to plant freely.

Better Cultivation is, however, more desirable than a larger area. Wet land and weeds are the great enemies of the corn crop.

Early Planting is desirable, provided the land is warm and in good order.

On Rough Land we would plant in hills 3 1/2 or 4 feet apart. We can then cultivate both ways and clean and subdue the land with little hoeing.

On Clean, Smooth, Rich Land we think it pays to drill in the crop. When the stalks are valuable for fodder, and the land is rich enough, we are sure that drilling is more profitable than planting in hills.

Drilling has one great advantage. The work is not only done much more expeditiously and cheaply, but you can put in the seed every day as fast as the land is plowed and harrowed, and thus avoid delay from wet weather. A drill that would drop in hills so as to have the rows straight both ways would enable us to do the same thing, but we have never yet found a drill that will drop the seed exactly in the hills.

Wheat can be sown either broadcast or dropped

on the hills after planting, or dusted on the leaves of the young plants. If there is a manure attachment to your drill, it is a good plan to drop the plaster with the seed.

Mangel-wurzel should be sown as early as the land can be got in good condition. We sow in drills about 30 inches apart, with an ordinary grain drill. The land should be rich, and then 300 lbs. of good superphosphate mixed with coal-ashes and drilled in with the seed will be a great help. Sow 4 lbs. of seed per acre. Thin out the plants to 12 or 15 inches apart in the rows. If you sow by hand, soak the seed for 48 hours in rain-water, changing the water every 12 hours. Cover the seed from one to two inches deep. Roll the land before and especially after sowing the seed.

Potatoes as a rule, especially Peachblows, do best when planted early; but we have had a good crop of Flukes planted as late as the first of June. A clover sod on light loam is considered best for potatoes. If the land is dry and rich, it does not matter what the previous crop may have been. Mark the land carefully three feet apart each way, and drop one large potato or two sets in each hill. Cover two or three inches deep with a hoe. A spoonful of plaster dropped in each hill frequently has a beneficial effect. We have known it increase the crop 50 bushels per acre. If planted in drills, drop the sets 15 to 18 inches apart. We make the drills with a light steel plow, 3 feet apart for Early Rose and 3½ feet for Peachblows. Cover with a plow three or four inches deep, and as soon as the weeds begin to start, or before, harrow the land with a Thomas or other light harrow. See Hints for last month.

Beans are sown as soon as we are through planting corn. They are usually sown on a clover sod. Rows 2½ feet apart, and four or five beans in a hill 12 or 15 inches apart, or if drilled in with a grain-drill, drop the beans about two inches apart. Plow the land carefully and harrow very thoroughly, and roll before planting. Use the cultivator freely and keep the crop clean. If you can not do this do not go extensively into bean growing.

Mowing Land should be got ready for the machine. Pick off stones. Put a stake by the side of any stone that can not be removed, so that you will not run the machine against it.

Sow Plaster on clover and on dry upland meadows—say one to two bushels per acre.

Pastures are frequently injured by turning stock on to them before the grass has got a good start. Keep the stock on grass land intended for corn, potatoes, or beans until the regular pastures afford a good bite.

Young Clover, when the dew is on, is very apt to produce hoven in cattle when first turned out to pasture. The green, wet clover ferments in the stomach.

Milch-Cows will be longing for green grass before it is ready for them. We do not believe in the notion that if they once taste grass they will not eat hay afterwards. It is not true. Cut up hay, moisten it with water, sprinkle on a quart of corn-meal and a quart of bran to each bushel of the hay, and let the cows have all they will eat, night and morning. Continue this feed after the cows are turned out to pasture as long as they will eat any of it. It will pay.

Calves should be fed liberally. Nothing, of course, is so good as new milk; next fresh skimmed milk, with flaxseed tea or oil-cake tea. A little nice early-mown hay, bran, oatmeal, corn-meal, oil-cake, sliced mangels, carrots, or parsnips are all good for calves in addition to a run in a sunny, sheltered pasture.

Sheep.—Let ewes and lambs have the best of pasture, and give a daily feed of clover hay and sliced mangels if you have them. Dock and castrate the lambs when three or four weeks old. Tag the old sheep, and keep a sharp lookout for any symptoms of foot-rot. If any are affected, pare and dress the feet of the whole flock immediately with crude carbolic acid or a saturated solution of blue vitriol.

Do the work thoroughly, and repeat in three or four days.

Swine should have rings in their noses and be turned out to pasture every day. Clover is best for them, but they will do very well on grass. Young, growing pigs should have some grain in addition to the grass. Pork is likely to be high next winter, and it will pay to feed liberally.

Work in the Horticultural Departments.

In all sections wherein gardening is carried on May will bring plenty of work. There will be the planting of the general crops, besides the numerous odd jobs of which every garden has its share. There will also be an abundance of weeds to contend with, which will give constant employment. Aim to always keep in advance of the work. If the weeds are once allowed to become established the labors of the coming season will be more than doubled. Keep the cultivators, hoes, and rakes moving rapidly. This will be all the more necessary should a long season of drouth ensue. Then, watering is impracticable, and all that can be done is to stir the soil as often as possible. Keep a record of the daily operations. It will take but a few minutes each day, and will be of much value for reference in the future. Put down the date the different crops are planted, kind of manure applied, and any other items of interest.

Orchard and Nursery.

Root-Grafts should be got out at once, setting them in rows four feet apart, and the grafts twelve inches in the rows, taking care to press the earth firmly around the lower part of them.

Planting of all fruit trees must be completed as rapidly as possible. If properly heeled-in, they can be set out a week or two after those in the nursery have started. If crops are to be raised between the rows, supply plenty of manure so that the trees will not be robbed of nutriment. In planting, have the trees set out in straight rows. Nothing looks more slipshod than trees planted irregularly.

Trees received from the nursery should be buried root and branch for a few days if their bark is shrivelled; this will usually restore them. If the buds have started from too much heat and moisture, cut back severely before planting.

Mulch.—If orchardists would mulch their newly-planted trees as soon as set out, there would be less complaint that nurserymen send out poor stock. The mulch prevents the soil over the roots from drying, and insures a vigorous growth.

Insects.—It is not yet too late to look after the eggs of the tent-caterpillar. It will require less time to destroy them now than when they are hatched. Wild-cherry trees serve as breeding places for caterpillars, and if any are allowed to remain they too should be kept clear of them.

Seedlings should all be set out this month and the rows kept clear of weeds. Seeds should be sown at once in fine soil. Collect seeds of Maples, Elms, etc., as soon as ripe, and sow at once. Evergreen seeds require to be sheltered with lattice-work or brush; otherwise the sun will kill the young plants as soon as they get above ground.

Grafting should be finished this month if not completed last. It is best to set the grafts just before the leaves start, but where there are a great many to be set this can not always be done.

Fruit Garden.

Planting.—The directions given above will serve in this department as well.

Packages.—Where fruit is marketed, provide a supply of crates and baskets, and see that they are in order for immediate use and properly marked.

Cuttings of currants and gooseberries buried last fall may be set out, and after one season's growth will be fine young plants. Press the earth firmly around the cuttings.

Grape-Vines.—Be careful not to injure the buds

when working among the vines. Allow only one cane to grow on newly-planted vines the first year; select the strongest, and remove the others.

Currants.—If borers have worked in the bushes, cut out all the injured portions and burn; their work will be shown by the yellow, sickly appearance of the bush. Dust the leaves with powdered white hellebore if the currant-worm appears. Mulch both the old and newly-planted bushes.

Strawberries must be set out as soon as the ground will allow. Use only strong plants from runners. Keep the beds, both old and new, clean and well mulched, to prevent weeds from growing, and to keep the berries from being soiled with earth. Cut off all runners unless plants are wanted.

Raspberries and Blackberries should have been set out last month, but if not attended to then do it as early as possible. Tie up the last year's growth to stakes or trellises, and apply a heavy mulch.

Kitchen Garden.

Such of the hardier vegetables as were sown last month will now be growing, and should be kept free from weeds, and, as soon as large enough, thinned. In most localities, all the varieties of vegetables, except perhaps tomatoes and egg-plants, may be planted in the open ground now.

Asparagus.—Do not cut until the plants are two years old, and if they can be left until three all the better for the future of the bed. Set new beds now.

Beans.—Do not plant until all danger from frost is over; then plant in rows three feet apart. Limas started on sods under glass may be set out when cool nights are over; and when the ground becomes dry and warm seeds may be put in.

Beets.—Thin out the early plantings and keep carefully hoed; the thinnings make greens, preferred by many to spinach. Plant for a succession.

Cabbages, Broccoli, Cauliflower, etc., all need the same general treatment when young. Set out early plants from the hot-bed or frame, and keep well hoed. Sow for late crops in the open ground.

Carrots.—Sow the main crop when the soil is warm, and keep clean from the start, or the weeds will soon exceed the carrots in size, and the crop be injured.

Celery.—Sow seeds, if not already done, in open ground.

Corn.—Plant as soon as all danger of frost is over in drills 3½ to 4 feet apart. Plant every week or ten days for a succession.

Cucumbers.—Plants started on pieces of sod may be set in the open ground and covered at night with frame or even a paper to prevent their becoming chilled. Sow seeds in open ground as soon as warm, and dust the plants when up with plaster or ashes to prevent the "bugs" from working on them.

Egg-Plants.—Do not set out until cool nights are over and the ground becomes thoroughly warmed; then set in rich soil two feet apart each way.

Lettuce.—Keep the soil around early-set plants loose and free from weeds. Set out new beds and sow seed for a later crop.

Melons require the same treatment as cucumbers. When growing well, give liquid manure once or twice a week.

Onions should have been sown last month to insure a good crop. Weed as soon as up and keep the soil stirred often. Ashes worked in between the rows, and worked in with a hoe, and a dressing of salt are beneficial.

Parsley.—Soak the seed in warm water and sow in open ground, patting down the earth well.

Peas.—Bush before they fall over. Earth up a little when hoeing. Plant late sorts in rows four to five inches deep, so that they will not dry out during warm weather.

Potatoes.—Finish planting for general crop, and hoe the early sorts as soon as up. Just before the potatoes appear above ground draw a harrow over the rows; this will destroy numerous weeds.

Radishes.—Sow every week for a succession, and keep clear of weeds.

Parsnips.—The earlier these are sown the better the crop is likely to be. Use only last year's seed. Hoe and weed as soon as the plants appear.

Rhubarb.—Do not gather from plants set last year. Cut off all flower-stalks as soon as they appear.

Squashes for late use should be planted by the middle of the month in rich soil. Treat the early sorts the same as cucumbers.

Tomatoes.—Transplant as soon as warm enough to the open ground, setting the plants 4 feet apart.

Turnips.—Dust air-slaked lime or ashes on the young plants as soon as up to destroy the black fly which attacks them.

Flower Garden and Lawn.

Planting will form the main work in this department for the first part of this month. Evergreens succeed best when planted some time during this month. Great care must be used not to allow the roots to dry by exposure to the winds, as when this happens the tree seldom survives. Set out ornamental trees at once before they commence their growth. If any trees need moving attend to it at once.

Lawns.—Clear up all dead leaves, sticks, etc., if not done before. The lawn should be cut often in order to keep the surface neat and smooth. If the grass is not too thick allow it to remain on the ground; it will serve as a fertilizer, and also prevent the sun from drying out the roots.

Shrubs.—A selection of early flowering shrubs will give a place an attractive appearance in spring before the leaves have started on the ornamental trees. Shrubs flower better if properly pruned.

Edgings around walks and beds should be kept neatly cut, and no grass or weeds allowed to grow on the paths.

Paths.—If any new paths or drives are needed make at once, and use plenty of broken stone as a foundation, and finish with gravel.

Annuals.—Sow as soon as the ground becomes warm—at least by the middle of the month. Keep the beds clear of weeds.

Perennials should be planted in a separate bed from the annuals. Sow seed of those now coming into flower as soon as ripe.

Bulbs.—Set out Gladiolus, Tiger-flower, and Lily bulbs in rich soil. Tuberoses do best if planted in pots and started in the house before setting out.

Climbers.—Sow seeds of Sweet-pea, Cypress-vine, Morning Glory, etc., where a screen is needed and for covering trellises.

Dahlias started in the house may be planted out now, and as soon as they commence their growth they must be tied to stakes.

Greenhouse and Window Plants.

Do not put all the greenhouse plants out of doors, as is sometimes done, but keep the house looking well the year round. This can easily be done if a little pains is taken with shading.

Shelter.—Some shelter is needed for Camellias and other greenhouse evergreens when they are placed out of doors during the summer. The best thing is a sheltered spot surrounded by trees, but not under their drip, and the ground where the pots are to be placed covered with coal ashes to keep out worms. Florists use a lattice-work shed built for the purpose.

Plunging is sometimes resorted to with plants which it is not expedient to turn out of the pot, and also when it is desirable to use greenhouse plants for decorating the lawn. Such plants as Palms, Yuccas, Ficus, and other subtropical things, may be used for this purpose with fine effect.

Bedding Plants.—Do not set out until settled warm weather, and then in good soil, and give water until the plants are well established.

Summer Propagation may be carried on in a cool greenhouse kept shaded during the middle of the day.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, from our daily record during the year, show at a glance the transactions for the month ending April 13th, 1874, and for the corresponding month last year:

Table 1: TRANSACTIONS AT THE NEW YORK MARKETS. Receipts and Sales for Flour, Wheat, Corn, Rye, Barley, Oats.

Table 2: Comparison with same period at this time last year. Receipts and Sales for Flour, Wheat, Corn, Rye, Barley, Oats.

Table 3: Stock of grain in store at New York. Wheat, Corn, Rye, Barley, Oats, Mill.

Table 4: Exports from New York, Jan. 1 to April 9. Flour, Wheat, Corn, Rye, Barley, Oats, Peas.

CURRENT WHOLESALE PRICES.

Table of current wholesale prices for various commodities including Flour, Wheat, Corn, Rye, Barley, Oats, and other grains and oils.

Gold has been up to 113 3/4 and down to 112—closing April 11th at 113 3/4 as against 112 on March 12th. The receipts and sales of Breadstuffs have been on an extensive scale for the season. The arrivals of Corn have been unusually heavy. The demand for Flour, Spring Wheat, and Corn has been active, largely for export. Prices have been variable, closing generally with more firmness. The dealings in Oats have been quite liberal, and the market closed strong; prime samples of both Mixed and White, scarce, and wanted for trade purposes. Rye has been in better request, and much firmer toward the close. Barley has been plenty, and seriously depressed in price, with less inquiry for sup-

plies. Spring Wheat and Mixed Corn has been sold to a considerable extent for forward delivery at the ruling figures. There has not been much call for Wheat, millers having been the principal buyers, and purchasing only to meet urgent wants. The rise in ocean freights toward the close tended to check operations on export account. Provisions have been more active, the transactions in Pork, Lard, and Bacon having been largely on speculative account at firmer rates. Beef easier; Butter and Eggs much cheaper; Cheese about steady. There has been a fair movement in Cotton for prompt and forward delivery, closing, however, in favor of buyers. Tobacco, Seeds, Hay, and Straw have been moderately sought after within our revised range. Wool has been in fair demand, and though somewhat irregular during the month closed rather stronger, with very scant supplies of really desirable grades available. From California the reports are that shearing is now quite general, and that the San Francisco market will be quite liberally supplied in the course of a few weeks. A lot of 48 bales new Spring Clip has been sold in San Francisco at 25c., gold. The Wool was from Santa Cruz Island, light condition with few burs. According to recent advices, fully a fourth part of the sheep in Northern California has been lost, which loss, however, will probably be made up by the increase of the clip in Southern California, so that the quantity of Wool raised in 1874 will doubtless about equal the clip of 1873. Hops have declined materially, on a very dull market. In most other articles trade has been without notable activity.

New York Live-Stock Markets.

Table of New York Live-Stock Markets showing week ending receipts for Bees, Cows, Calves, Sheep, Swine, and Total.

Average per week for Bees, Cows, Calves, Sheep, Swine. Do. do. last month. Do. do. prev's month.

Beef Cattle.—The regularly increasing supply of cattle has to some extent prevented an advance in prices that the good demand might have warranted. At the close of last month an increase of over 1,000 head per week broke the market, which remained dull until the still further increased receipts at the beginning of April reduced prices fully 1/2 c. per lb. Prices are yet too high for liberal consumption, and the market is sustained only by the unexpectedly good demand. Trade has been active during the month since our last report, and as we close we have to note a falling off in the demand and a shrinkage in prices, extra heaves selling at 12 1/2 c. @ 13c. to dress 60 lbs. per cwt.; steers and oxen bringing 10c. @ 12 1/2 c. to dress 56 to 58 lbs.; and rough cattle, dressing 55 lbs., selling at 9 1/2 c. per lb.

The prices for the past four weeks were as follows: Table showing week ending range and average prices for Large Sales.

Milk Cows.—The demand has been steady, with a fair promise of advanced prices; but the heavy receipts of March 29 were too much for the trade to dispose of without a reduction, and prices were marked down \$5.00 per head. At the close the market was tame, with a little better feeling, the range being from \$40 to \$80 for cow and calf. Calves.—The receipts of this stock have been steadily increasing, but the demand has been steady also, and prices remain firm at 8c. @ 10c. per lb. for veals and 11c. @ 14c. per lb. for hog-dressed. Sheep and Lambs.—After a week or two of dullness, the market has fully recovered its tone, and sellers ask full prices, without, however, raising quotations. Buyers can get no reductions, and sales are about equal to supply. Unshorn sheep sold at the close at 7 1/2 c. @ 9 1/2 c. per lb., and spring lambs of poor quality brought \$6.50 @ \$8.00 per head. Swine.—The market for live hogs has been practically dead; there have been no offerings for many days, and those offered early in April were not good. Thin Ohio hogs averaging 121 lbs. brought 5c. per lb., and good hogs would bring 6c. Dressed hogs have been easy throughout, and the quotations as we close are 7 1/2 c. @ 7 3/4 c. per lb., with 7 1/2 c. as the ruling price.

As to Breeding Sows.—"D. L. G." Honey Creek, Mo. Although it is stated by some writers upon "the pig" that if a sow is not brought to the boar when her pigs are two or three days old she will not breed again until the pigs are weaned, that is not always the case. On the contrary, sows are sometimes brought to breed when their pigs are four weeks old, as in your case, but more frequently they are not. If the sow is allowed plenty of exercise, and is well fed, she will less often fail to breed than when kept up in a pen. No directions can be given for spaying sows. The operation must be learned by practice only.

DO YOU WANT ONE OF THE VALUABLE PREMIUMS? TWO MONTHS MORE.

May and June are the two months remaining, during which any person who wishes to obtain one or more of the useful and valuable articles offered in our Premium List (of which a copy will be sent free to any applicant, see page 199) can easily get them. This has already been done by more than 14,000 persons, who during years past have tried with success the raising of Clubs of Subscribers for our papers, and availed themselves of the liberal offers of Premiums made by the Publishers.

We invite all our Subscribers to take hold of this work and secure a Premium while the offer is open. Specimen copies of both papers will be sent to any wishing to show them for this purpose.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money:—Checks on New York City Banks or Bankers are best for large sums; make payable to the order of **Orange Judd Company, Post-Office Money Orders** for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

Postage: On *American Agriculturist*, 12 cents a year, and on *Hearth and Home*, 20 cents a year, in advance. Double rates if not paid in advance at the office where the papers are received. For subscribers in British America, the postage, as above, must be sent to this office, with the subscription, for prepayment here. Also 20 cents for delivery of *Hearth and Home* and 12 cents for delivery of *American Agriculturist* in New York City.

Bound Copies of Volume Thirty-two are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the last seventeen volumes (16 to 32) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Clubs can at any time be increased by remitting for each addition the price paid by the original members; or a small club may be increased to a larger one; thus, a person having sent 10 subscribers and \$12 may afterward send 10 more subscribers with only \$8; making a club of 20 at \$1 each; and so of the other club rates.

The German Agriculturist is published at the same price as the English edition, and is mainly a reproduction of that paper, with a special department edited by the Hon. F. Münch. Will our readers kindly mention this to their German friends? Perhaps some who employ Germans as gardeners, laborers, etc., would be glad to supply them with useful reading matter by subscribing for the German edition for them.

Gardening for Profit.—New and enlarged edition. The success of Mr. Henderson's work has been something unparalleled in the history of rural literature. No work of its class has in this country, and probably not in any other, had anything like the sale this has met with. The reasons for this are that it met a want which no other book did, and the author told all the secrets of the business without any reservation. The publishers intended to bring out a new edition next fall, but the demand during the past few months has been such as to make it necessary to produce it at once.

Several new chapters have been added, and, in the selection of varieties, much has been changed, though the plan of the work is the same as before. The new edition, now in press, will probably be ready by the time this reaches our readers, or a few days after. Though over thirty pages larger the price will remain the same, \$1.50 by mail.

Our Western Office.—Our friends in the West are reminded that we have an office at No. 4 Lakeside Building, Chicago, Ill., in charge of Mr. W. H. Busbey. Subscriptions to *American Agriculturist* and *HEARTH AND HOME* are taken there, and sample copies of the papers and chromos are delivered, and orders received for advertising on the same terms as in New York. All our books are on sale at the Western Office. Please call and examine, buy, subscribe, and advertise.

Prize Essays on Lawn Management.—The makers of the "Philadelphia Lawn Mower" offer prizes for the best essays on the management of lawns. There are nine prizes, amounting in all to \$368. The competing essays must be received at the office of the makers, 631 Market street, Philadelphia, before the first of June.

Black Ash Shingles.—"A Constant Reader," West Shelby, N. Y. We know of nothing that will prevent black ash shingles from warping; it is their nature to warp. If we had no choice but to use this timber we would work it up into what are called "shakes," strips two feet long, eight inches wide, and three quarters of an inch thick at the butt, and use them.

Cabbage for "Crout."—"H. C. C.," Adams Co., O. Any hard-headed cabbage is used for making sauer-kraut. The Flat Dutch and Bergen Drum-head are used about New York, but any one adapted to your soil will answer.

Bugs on Grape-Vine.—E. O. Wetteyer. The insects that eat off the blossoms of your grape are no doubt rose-bugs. The only remedy is to shake off early in the morning, catch in a dish with water, and kill.

The Michigan Bee Association will convene at Kalamazoo, May 6th, 1874. Arnd C. Balch is President.

The Horticultural Exhibition of Lyons, France, is now one of the most important held in Europe; a note from the Secretary of the Cerele Horticole informs us that the next annual exhibition will be held in September next, 17th to 20th.

Buried Pork.—"C. W. N.," Essex Co., Mass., in digging a cellar, discovered a fat hog which he had buried four years before, and found it in a state of almost perfect preservation. He asks why it did not decay. Fat buried in this manner decays very slowly indeed, and there was probably enough to protect the other parts of the animal. Oily seeds, when buried deeply in the soil, are preserved for a very long time. It often happens that fat, and even flesh, when buried, is converted into a peculiar substance called adipocere, and in this state bodies are found after very many years, with their form almost perfectly preserved.

Size of an Acre.—"J. D.," Brooklyn, N. Y. A piece of land 210 feet on one side and 207 feet 5 inches on the other, will make an acre. If an exact square is desired the side will be 208 feet 8 inches and $\frac{6}{10}$ of an inch. Upon newly broken prairie sod a crop of 20 bushels of wheat is a fair yield; with every favorable circumstance this yield may reach 25 to 35 bushels per acre. Even more than this has been occasionally raised.

Sending Plants by Mail.—"A. C. S.," Factoryville, Pa., writes—"I sent some strawberry, raspberry, and other plants to my son in Washington Territory by mail, packed in the following manner. I took common quart oyster cans, cut out one end to make room for packing, moistened the plants, filled the cans, putting some damp moss on top. Cut a piece of tin the right shape to cover the end of the can, and soldered it tight. Put paper around the whole for convenience in directing. Although they were nearly four weeks on the way, yet they arrived in good order, and nearly all lived."—This will answer in cold weather with dormant plants, but had the weather been warm, or the plants in a growing state, they would have been decayed and useless.

Newburgh Bay Horticultural Society.—This wide-awake society announces its annual exhibition for September 22d to 24th. Aside from the

great shows at Boston and Philadelphia such a fine display of fruit can not be seen elsewhere.

SUNDRY HUMBUGS.—In fulfilling our duty in looking over the mass of humbug material, one is reminded of a certain resemblance these affairs have to plants. We hope the plants will excuse us for mentioning them in such company, but it is only in the matter of duration that humbugs resemble them. Some plants perform their career in a day, others take weeks and months. Again, some endure for a year and two years, while many continue from year to year indefinitely. The humbugs are many of them too lovely to last, and have almost the evanescence of the mushroom. Of this kind is the Magnolia (Iowa) "Library Concert," run by the promising Maynard. We mentioned last month its removal to Chicago, but before the article reached our readers the "moral" youth was stopped; the hard-hearted officers, who had no "music in their souls," arrested Mr. Library-Concert-man, and thus this affair went out almost as rapidly as a puff-ball under a hot sun. Of the annual kind the majority of the quack medicines are good examples, as the average duration of these is not more than a year. Now and then one of these turns out a perennial, but they rarely flourish after the first winter. The most lasting humbugs are those which are on the border line between rascality and respectability. The Kentucky Public Library Lottery is an example in which a scheme is kept along by the aid of names that have heretofore been considered respectable. This is a perennial, the existence of which depends upon the season. So long as there are showers of greenbacks every few months this disgraceful affair will survive, but when people become tired of throwing away money upon it there will be an end.

THE CRIES OF THE WOUNDED

after a battle is one of the saddest things about war, and it is really the sober side of our humbug matters. However vexed we may feel that a person should be so stupid as to trust his money to swindlers, whose promises every sensible person must know can never be made good, yet after all we read the letters of the victims with sadness. There is often a touch of the pathetic in the complaints of those who could ill afford to lose; but there is hope for them, as they generally request us to publish their cases as warning to others. The victims of the Union Furnishing Co., of Chicago, have not yet ceased to cry out. All the consolation we can give them is that Geo. B. Hodge & Co. are closed, and that they have thousands of companions in suffering. These letters are sad, but one from a man in Vermont is

A HORSE OF ANOTHER COLOR.

This gentleman likes the *Agriculturist* because it exposes humbugs, but he is on the lookout for a "gift enterprise" that is reliable. He sends us a circular of one which claims to have done business for ten years, and says, "If I could see any one who ever drew anything of any account, or a large sum of money and got it, I might have some faith." Faith in a gift enterprise! Here is a confiding gentleman. Why, bless your dear Green Mountain heart, the object of these men is to get money, not to give it. There are many things in which one may have "faith." To take no higher view, you may have faith that honest work will bring honest money, that a dollar earned will do you in the end more good than a hundred dollars cheated out of other people, as it would be if you drew it in a lottery—but "faith" in a "gift enterprise" never!... Here we have it:

"DOCTOR MARTELLUS IMPROVED MAGNUM OPUS."

What Dr. M.'s "big work" was before he improved, we don't know, but now it is a "chemical preparation for making all explosive fluids non-explosive." What mischief this will play with the nitro-glycerine business. And then "this preparation not only saves lamps from exploding, but prevents chimneys from cracking and breaking." It will not mend a cellar door and put a baby to sleep yet, but when this "magnum opus" gets "improved" a few more times we can't say what it may do. Such things as these are hawked about the country by plausible, glib-tongued fellows, who can convince nine people out of ten that the claims are true, and apparently prove it by experiment.

Gumption is not an elegant word, but it is the only single one that we know of that expresses in short "an intelligent and practical knowledge of matters and things in general." If *gumption* could be imparted at schools, if a majority of people had it, these multitudinous humbugs would have "no show." Alas! the lack of *gumption*. Once in a while these vendors meet the wrong customer. The chap with the "magnum opus" happened at Tiffin, Ohio, to meet with a man with *gumption*—but we will let him tell his own story: "This evening a young man called at my house selling a compound (see the inclosed circular). After putting some of his preparation into the lamp, he lighted the wick and stuck it in the lamp, but coal-oil of the proper standard will admit

of that. When he came to test the chimney, he dipped it in cold water, then put it on the lighted lamp, and as soon as he could be commenced throwing cold water on it without its breaking. I asked him to let the chimney get thoroughly heated, and then apply the cold water. The result was a broken chimney. Before he commenced his experiments I asked him what was your opinion and also that of Munn & Co. His answer was it was something new. He acknowledged before he left that he gave up all hopes of selling any to me after my asking the opinion of the agricultural and scientific papers."

If any live where they can not get this "magnm opns," we can tell them that a little *silicic oxide* or *calcic carbonate*, which the unlearned call sand and chalk, if put into a lamp, exactly 23 grains of each, will prevent all danger to the lamp—provided the right kind of oil is used. It may be well to say here that even very dangerous oil will extinguish a lighted match—oil does not explode; it is the vapor from the poor oil mixed with air that explodes.

DOUBTFUL CASES.

We have already stated that we keep many cases under advisement awaiting investigation, and when the suspected parties are at distant points this often takes a long time. Among the concerns that we have had inquiries about are several that look suspicious; but we can not give definite answers. If the writer of either of these inquiries should go to a merchant to buy goods upon credit, he would be asked at once for his references. Every man who has money should put himself in the position of the merchant who has goods to dispose of, and before he lets his money go out of his hands into those of an unknown person, demand references, or some assurance that he is to be trusted. The gentleman who inquires about the "Mississippi Valley Manufacturing Co." should not send money until he first finds out if there is such a company; which he can do by writing to the mayor or city clerk of the place..... If there is such a concern as the "Empire City Paper Co.," it does its business in a room far up-stairs, with a hole in the door for letters. We hope our Tennessee friend will get his paper..... The "Five Dollar Sewing Machine" chaps are—as the market reporters say—much inquired after. We have yet to see a \$5-machine worth the money, and we have tried very hard. At one time we had a curious collection of these rattle-traps. We have just now but one, that sent out by A. Cateley, Supt., corner Greenwich and Cortlandt streets. If any one wishes to buy this for something less than \$5, we are open to an offer "on account of whom it may concern." We are asked if this Cateley is the same Cateley & Co. who offer cheap watches in another part of the city.

OFFERS OF COUNTERFEIT MONEY

still continue. We say offers, for these people are not fools enough to have or part with any. If they get a poor weak fellow into their hands, they will get his money and give him nothing in return—well knowing that one who enters into a bargain with them dare not "sneal." It is of no use to publish the names under which their circulars are sent, as each one of the gang has a dozen aliases, and they are changed so often that it can help nothing. The postal law checked the flood of circulars for a while, but the chaps send them to be mailed at small places where there are no detectives. The business presents no novel features.

MEDICAL HUMBUGS.

Almost every month there is some interesting novelty in this class of humbugs, but the spring styles do not open very attractively..... A young man asks our opinion of "Diftenbangh's Remedy."—We do not give an opinion of secret remedies of any kind. If he wishes advice, we will say—let them alone..... Here comes J. W. Van Namee, M.D., all along with a lavender-colored pamphlet about "Psychometric and Clairvoyant Powers to Locate and Diagnose Disease." There! if that isn't "pooty tasted," we don't know. The whole subject is too much for us, and we turn to something more tangible. "The Good Samaritan," published by E. Andrews, Albany, N. Y. The great trouble about many of these incarnations of evil is that we can not tell just how bad they are without polluting our pages. Here is this Andrews, who blasphemously uses the name of Jesus, and on the next leaf proposes to do that which we can not mention. The pamphlet *irly* reeks with foulness, deceit, and humbuggery. The wretch claims to have healed diseases "at the Holy Sepulchre, at the Well of Siloam" and numerous other sacred spots upon one page, and upon the next offers to tell how to catch fish without bait or net. He claims to have lived in Albany for over a quarter of a century, which shows what a city in the present day may tolerate and not meet with the fate that befell Sodom and Gomorrah.

THE "NATIONAL SURGICAL INSTITUTE."

A gentleman writes from Indianapolis that he highly

approves of our course in showing up "humbugs," but thinks we ought not to include the above named concern, as he believes that it is doing "a great deal of charitable work, pecuniarily and professionally." If the persons managing this "institute" had not claimed in their circular to be regularly educated physicians, we perhaps should not have noticed it. We judge the "institute" solely by the manifestoes it sends out. Let us ask our correspondent what he would think if he received a circular like this: "The National Church, served by first-class, regularly ordained Ministers, open every day to attend to the cases of sinners. The most hardened that have been to other churches, and not converted, are advised to try here. We have several remarkable sermons on hand, of a kind not preached in any other church." Following this an enumeration of particular sins; then a lot of portraits—A B before attending, A B while being preached to, and A B after conversion. Besides this, the pattern of the clergyman's gown, three or four styles of baptismal fonts, and an exact representation of the communion service. Imagine a whole broadside covered with engravings of this kind to match an equal space on the other, covered by the most ridiculous claims for the peculiar efficacy of this church over all others. Would not our Indianapolis friend be simply disgusted with a circular of this kind? Would he not feel not only that the claims were absurd, but that the pictures were of things that should not be presented to the public eye? Would he not say, "If this church is not a humbug, and its ministers quacks, why do they act in a manner to make people think they are?" That is all we have to say about this institute. If the persons connected with it are educated men, why do they act like quacks? If properly educated physicians, as they claim to be, how horribly must they feel when they see the circular, which is absolutely repulsive with its human deformities and snfering and is in form and manner like the advertisements of quacks and impostors.

Butter-working Machinery.—"J. A.," New York. The "Dake" process of working butter is as well adapted to the purposes of country stores, where butter of all kinds is received, as any we know of, and perhaps better. Such butter of various colors and qualities is not salable in the market except at a low price, but if well mixed and brought to a uniform color it is more readily salable, and fills the demand for a low grade by the poorer class of consumers. This is accomplished by this process. The address of the party is D. W. Dake, Beloit, Wis.

Patent Phosphate.—"T. M. H.," Hunterdon Co., N. J. There can be no patent upon a so-called superphosphate made by mixing 600 lbs. bone-dust with 200 lbs. oil of vitriol, and seven bushels of earth with some salt, gypsum, and nitrate of soda. It is wanting in novelty, as such mixtures have been made for years back by hundreds of people.

Milk Fever in Cows.—This disease is to be feared amongst cows over four years old that are well bred and good milkers, and that receive more than ordinary care and attention. The system in a vigorous condition, filled with rich blood, and not having the elasticity of that of a younger and growing animal, is suddenly subjected after calving to a reflux of the blood which has been circulating through the system of the calf. The drain upon the mother's system consequent upon the support of the calf's life is stopped, and a great reaction occurs. The parts of the body which have been excited during the birth of the calf suffer from the reaction, and the womb and udder and frequently the bowels become inflamed. Sudden changes of the weather also increase the difficulty, and after a fit of shivering, which may occur from the first to the third day, a fever sets in, the appetite fails, rumination is stopped, weakness across the loins causes a staggering gait or an inability to rise, the udder is hard, hot, and swollen, the animal groans, looks wild, and frequently falls into convulsions, or becomes frantic and dashes her head about violently. When these last symptoms occur, rapidly following the first, recovery is very doubtful. To prevent an attack of this disorder, the cow's feed should be reduced some time before calving, and only hay and bran gruel be given to her. The bowels should be kept loose by a few handfuls of linseed meal, and plenty of salt should be given. If the cow is in good flesh she should have one pound of Epsom salts with half an ounce of ginger a week before her time is up, and as soon as she shows signs of calving in the relaxation or looseness of the hinder parts, she should be kept in a quiet and well-sheltered part of the stable; a loose box or stall being the safest place, in which she need not be tied up. If there is a flow of milk it should be drawn from the udder. If the cow has had this fever previously, or her symptoms cause an attack to be expected, she should be given twenty-five drops of tincture of aconite three or four

hours after calving, repeating the dose every six hours until four doses have been given. If, in spite of all precautions, an attack occurs, the aconite, as previously mentioned, should be given along with two drams of powdered opium in a bottle of thin gruel immediately. A pound of Epsom salts with half a pound of common salt dissolved in water, with some sugar or molasses to flavor it, should be given soon after. Cloths dipped in hot water should be placed across the loins, and the cow should be covered with blankets. All the cold water she will drink should be given as frequently as may be needed, and she should be kept as quiet as possible. The milk should be drawn every few hours. Pure, fresh air is also indispensable.

Seven-Months' Calf.—"Subscriber," Westchester, N. Y. It is not impossible for a cow to produce a perfect calf in seven months. Cases occasionally occur the authenticity of which is undoubted.

Eggs all the Year Round.—"W. H. H.," Jersey City, N. J. It can not be expected that a hen should lay continually. The productive capacity of a hen is enormous when she lays moderately well. If she lays 120 eggs a year she produces fifteen pounds, or thrice her own weight. Some time for rest is therefore necessary. But if hens are allowed to set and produce a brood of chickens, their time is not only profitably employed, but by skillfully arranging the time of setting, some may be brought into laying while others are "laying off." Some hens may be set early in the summer and they will lay in the fall, and some may be set later and they will lay during the winter if fed generously and kept warm.

Cross-bred Fowls.—"W. H. H.," Jersey City, N. J., writes as follows: "A neighbor of mine crossed a Black Spanish hen with a White Leghorn cock. Some of the chicks were black and some white, but the most of them were a mottled gray color, which have made very fine fowls, and have proved themselves remarkably good egg-producers. The pullets commenced laying December 26th, and by March 1st the flock of twenty-five had laid 586 eggs.

As to Bots.—"D. J.," Ontario. Bots are the larvae of the horse gad-fly (*Cestrus equus*), and are in a condition exactly equivalent to that of the caterpillar of a moth or butterfly. They therefore can not breed or reproduce themselves in the stomach of a horse, being imperfect insects and incapable of breeding. It is easier to prevent their presence in the horse's stomach than to get rid of them. If the yellow nits or eggs which may be seen upon horses' knees or shoulders in July or August are washed off with warm water, or scraped off with the edge of a knife, the horse can not lick them off and carry them to their temporary resting-place. Every farmer should learn the natural history of the insects and animals with which he comes in contact; then he would know how to treat them with propriety.

To Kill Lice.—"D. J.," Thornhill, Ont. Whale-oil is fatal to lice and not hurtful to cattle. An ointment of three parts of lard and one of sulphur liberally applied is also destructive to lice.

Wheat Growing in Minnesota.—The St. Paul and Pacific Railroad Company have instituted a novel method of disposing of their lands in Minnesota. They sell 640 acres to one or four (not more) persons at \$6 per acre without any payments until the third crop has been harvested. The terms of sale are that the purchaser shall fence the whole of the purchased tract, break up the surface, excepting that part which may be too wet for tillage, plant forty acres in timber, and cultivate the rest in crops each year. The cost of the improvements by contract is as follows: breaking, \$3.50 per acre; sowing with wheat and seed, \$2.87½; harvesting, \$3 per acre; thrashing and hauling to depot, 14½ cents per bushel. The average yield of wheat is 20 bushels per acre, and the price from 70 cents upwards. Persons with a capital of \$5,000 are now engaged in raising wheat in Minnesota upon lands purchased on this plan, with every prospect of raising the purchase money out of the land before the time of payment shall arrive.

Spent Hops as Manure.—"W. B. C.," Sandusky City, Ohio. Spent hops are a very valuable fertilizer and are worth drawing 5 miles. They may be used as an absorbent in the stable or be composted with the manure, or piled up until rotten, being frequently turned to prevent dry rot, and then baled to the field and spread and harrowed into the soil. As a general rule manure should not be plowed under unless the land is to be soon cross-plowed, in which case the manure is brought near the surface again; and this is the best place for it.

Artificial Manures upon Poor Land.—"R. H. S.," Fayette Co., Pa. It would not pay to buy guano or superphosphate to apply to a corn crop without there was something in the soil to aid the effect of those fertilizers. They start the crop and it looks promising, but if the soil is not able to carry it out to maturity they can not do it alone, and the crop falls off and fails to pay their cost. This is beginning at the wrong end. The first thing to be done is to save the manure you are now wasting as you say by exposure to rain. It would certainly not pay to borrow money to buy guano in this case at \$110 per ton; but it might pay to buy some extra feed for your stock and improve the quality of the manure, and to make improvements in your stables and yards to prevent its waste.

Experiments with Waste from Wool-scouring Vats.—"G. P. L.," Philadelphia, favors us with the following experience with the waste from vats in which wool had been scoured. He pumped the water into a tight wagon box, holding 10 barrels, and hauled it on to the fields, where it was spread. A timothy meadow, to which it was applied, yielded 3 tons of hay per acre, and very good fall pasture. The crop of corn was increased by it one fifth, in yield of grain and largely in fodder. Potatoes failed partially; mangels failed entirely, and Hungarian grass, sown upon the same ground as a substitute, also failed. The waste contained the loss of 20,000, in shrinkage of 50 per cent on 40,000 lbs. of wool, which consisted of yolk and sand mainly; 5 casks of soda ash, 10 barrels of urine, and 5 barrels of cotton seed oil soap. (We should like to know upon what extent of land this was spread.)

Agricultural Plaster.—"J. V. V.," Salado, Texas. The sulphate of lime used for manure, is not calcined, but is simply the rock, crushed and ground fine. It is worth about \$7 a ton in New York.

Bones.—"E. R. S.," Greenbrier Co., W. Va. The best method of reducing bones for use in a garden is to place them in barrels in layers along with unleached wood-ashes and keep them moist for several weeks, when they may be readily pounded fine enough for use.

Plaster for Market Gardens.—"M. J.," Cherry Grove, Pa. We have no reason to believe that plaster would be of great service upon market gardens. It is a special manure valuable upon clover, peas, corn, and other broad-leaved crops grown in the field, but it is not sufficiently stimulating for the purposes of the market gardener; certainly not if used alone, but if used along with others it might be worth while trying with cabbages, potatoes, or corn. When sprinkled upon young cabbage plants, beans, melons, or turnips, it is often of use to drive off the flea or the squash bug.

Ashes for Top-Dressing Wheat.—"R. W. T.," Wicomico Co., Md. Wood-ashes may be applied to wheat as a top-dressing at any time. They will not injure either bones or superphosphate that may have been applied at the sowing of the wheat.

Shallow Plowing for Corn.—"R. H. S.," Dnnbar, Pa. It was once said by an intelligent farmer that the soil should not be plowed deeper than it could be manured. There is much truth in that idea. Upon that principle it would not be well to plow a sod for corn so deep that the sod is buried beyond the reach of the roots of the corn. The depth of the plowing depends altogether upon the character of the soil, and what may be right for one soil may not be so for another.

Peas.—"L. W. F.," Chambersburg, Pa. There are two varieties of peas known as Canada peas, one the Black Eye Marrow Fat and the other the Gray pea. The first is suitable to a rich soil, upon which it makes an extraordinary growth of fodder. The second is a pea with a less developed vine and smaller seed, but it will yield a crop where the first would be unprofitable. Any produce dealer or seedsman in New York could supply the seed. It arrives in this market in barrels, and is now quoted at \$1.25 per bushel.

Poland China Hogs.—"L. G. C.," Hawcahon, Ill., writes that he has sold his last July Poland China pigs in February of this year, and they weighed from 225 to 240 pounds. The spring pigs of the same breed were sold in the fall, and averaged 300 pounds each.

The Slide Gate.—"J. A., Jr.," Morrow Co., Ohio. The simple plan of sliding a gate upon a roller or a bar placed between two posts has been in use for many years. But there have been many patents taken out for peculiar rollers to be adapted to the sliding gate. We have frequently cautioned our readers

against giving notes to swindlers who claimed patent rights which do not belong to them, etc. If any device has been in use two years before a patent covering it was procured that patent can not be sustained, and if any person claims a patent right upon a gate, simply sliding upon a bar or an ordinary roller, which has been procured within 20 years past, he claims more than he can sustain at law. When one of these patent claimants comes along do not be frightened or let him bully you into paying anything. Ask to see his patent. If he can not show it, get the name in which it was issued and precise date of issue and tell him to call again. If he is an impostor he will bluster and will not be heard of again. If he is a real owner of a patent that you have unintentionally infringed, he will behave like a gentleman and give every opportunity for you to find out if his claim is a just one. For a small fee a copy of the patent can be had from the patent office. Recollect that the farmers have some rights that even owners of patents are bound to respect, and that the law was not made to oppress honest and innocent people.

Curdy Milk.—"A. A. B." When a cow's milk curdles while sweet and her yield suddenly falls off three fourths, it is evident that her health is seriously affected, but how or why, it is impossible to say without knowing something more than this bare fact.

Catarrh in Sheep.—"R. S.," Wayne Co., Michigan. Sheep if kept too warm in the winter will take cold and run at the nose. There is danger that this may affect their lungs and cause fatal disease in the spring. The remedy is to keep them during nights in an open shed with a yard attached to it, so that they may have the choice of in-doors or out-doors as they desire. They will generally choose the outside of the shed. A tea-spoonful of pine tar placed upon their tongues and one upon their noses will be some help. During the day they should have, at least, some hours' exercise, in a field or in a large yard in which there is no manure.

Pure Light Brahmas.—"A. L.," York, Pa. The description of a pure Light Brahma, according to Tegetmeier, is as follows: Head white, neck white with black stripes down the center of the feather, breast, belly, and thighs white, back and shoulders white, saddle white striped with black, wings white with a black stripe on the edge, formed by the black feathers known as "primaries," tail black, legs bright yellow, feathered with white feathers slightly mottled with black.

To Destroy Lice.—"J. H. F.," Colony, Mo. There is no really effective method of destroying lice upon any animal without oil or grease of some sort. In some recent experiments in England a mixture of one part of sulphur with three parts of lard and a mixture of one part of oil of tar with three parts of linseed oil destroyed the lice to which they were applied almost immediately, while corrosive sublimate, mercurial ointment, arsenious acid and carbolic acid were without any effect at the end of two hours, and tobacco water destroyed the vermin at the end of an hour. We have found a mixture of lard and kerosene oil to completely destroy lice both upon poultry and calves without any injury to the animals whatever. Kerosene oil alone will severely injure the skin.

Feed for Pigs.—"H. D.," Madison Co., Iowa. There are no roots so valuable for feeding to hogs, cooked, as potatoes. The prolific coarser varieties as the Harison, Peerless, or Garnet Chili would be the best to plant. The best green crops for summer feed are clover, peas and oats mixed, vetches or cabbages. Rye would answer for early spring feed. Hogs might, no doubt, be profitably pastured within hurdles, as is commonly done with sheep.

Care of the Poultry Yard.—"S. P. T.," Susquehanna Co., Pa. We have not sufficient room here to give full directions for managing a poultry-yard with all sorts of fowls and under all circumstances. Few books even can do all that, but "Wright's Poultry Book" will be found to contain as much as any other book we know upon these matters. Price \$2.00.

Food for Sheep and Lambs.—"E. P.," Otsego Co., N. Y. Roots should always be provided for sheep, yet they must not be fed in excessive quantities during the winter, as they then become indigestible and dangerous from the large amount of water they contain, which reduces the temperature of the stomach, and in the case of ewes in lamb have often caused death. For 100 sheep two bushels of roots, sliced and sprinkled with bran, may be given at a feed. Hay or straw should always be fed between the feeds of roots. The best roots are sugar beets and ruta-bagas. Mangels

are considered less valuable than these. Young lambs may be fed a small quantity of bran and ground oats, scattered thinly in a broad flat trough so that one can not get more than its share.

Impregnation of Turkeys' Eggs.—"T. Burr Marsh," Tewkesbury, Mass., states that in the spring of 1870 he purchased a flock of hens and with them a hen turkey which laid 15 eggs, and then wanted to set. The eggs were placed under hens; the turkey was broken up, and soon commenced to lay again. The second laying of eggs upon being set under hens proved fertile although there was no turkey cock in the neighborhood. Several other correspondents have related similar experiences, which shows that one impregnation fertilizes the eggs of a second brood of a turkey hen.

Nests for Early Chickens.—"J.," West Vincent, Pa., says that hens' nests for early hatching at this time of the year should be lined with clay. They are thus made warmer, being air-tight, and are cleaner than if of any other material.

Beans for Feed.—"Inquirer," Clinton, Co., N. Y. Old or discolored and unmarketable beans may be ground and fed to stock, either cows, hogs or poultry, with profit. But unless ground they are not readily eaten. For hogs or poultry the meal should be cooked and fed in thick mush, cold; for cows the meal should be stirred in hot water and given as a drink when nearly cold, or may be mixed with cut hay.

Sheep in the Orchard.—"B. S. H.," The obviously best cure for a sheep that barks apple-trees is to keep it out of the orchard. It is their nature to do this whenever they have an opportunity.

Duration of Scab.—"G. W. C.," Potter Hill, N. Y. It requires at least two years before the pasture or the yards which have been occupied by scabby sheep will become safe for the occupation of a healthy flock. Those places where the sheep have rubbed themselves have become infested with the insect which causes the scab, and in bad cases the ground itself may be in the same condition by means of dropped locks of wool; so that even careful whitewashing of the yards and fences may fail to make the place secure.

Slow Killing of Meat.—Philip Mick. The length of time occupied in killing an animal has no ill effect upon the meat; on the contrary, it is said to make it tender. For this reason, as well as to make the flesh white, butchers used to bleed calves to death so slowly that they were often twelve hours in dying, and the same practice was in use with turkeys until the cruelty was stopped by law. It is more likely that the diarrhoea complained of was due to some unhealthy condition of the animal, possibly from its possessing some parasite in its flesh, as "measles," which always produces this effect.

A Poultry House for Young Chicks.—"J.," West Vincent, Pa., describes a house in which he successfully raised a large number of early chickens last year as follows: It was ten feet long by eight wide, made of hoards except the front, which was glazed. There were four corner posts, a floor in it, and it was kept warm by a stove. The sash for the glass was made of laths, and the whole cost of the material was a few dollars. In fine weather the chicks were allowed to run out in a small yard exposed to the sun. In this house there was room for two hundred chicks. By giving good care to the chicks they may be taken from the hen very early, and the hen put to laying again.

Cure for Balking.—"W. P.," Port Chester, N. Y. There is no specific cure for a balky horse. Gentle treatment and extreme patience have often effected a cure of this vice. Violence and punishment only make matters worse.

Millet for Soiling.—"H. K. G.," Rockland Co., N. Y. Millet makes a very good soiling crop. We do not know that it is any better than fodder corn or so good, but it has the advantage of making a variety which is very agreeable and desirable for cattle, whose appetite it is necessary to stimulate in this way. The seed is very small and should be lightly harrowed in upon mellow soil. This crop succeeds better upon well-drained rich soils. If the soil is moist we would rather choose oats and peas mixed for a fodder crop.

Removing Turnip Flavor from Milk.—"Mrs. C. C. E.," Randolph, Wis., sends us the very old information that a pinch of saltpeter dissolved in the milk will remove the flavor derived from feeding turnips. As this may be new to some of our more recent

readers we repeat the fact, as well as the equally useful one, that if the turnips are fed immediately after the milking the next milking will be free from any disagreeable flavor.

Horse Talk.—"Clip," Natick, Mass. We would not breed from a spavined mare; the deformity, or weakness which causes spavin, is often constitutional and hereditary. The Turf, Field and Farm, published in New York, is a weekly journal devoted to the "horse interest" chiefly.

Sorghum.—"New Beginner," Ogechee, Ga. Sorghum, or as it is sometimes called, China sugar cane, is planted and cultivated the same as corn. About two quarts of seed per acre is used. The hills are generally planted four feet apart in check rows. The yield of syrup is from 100 to 300 gallons per acre, but so far the manufacture of sugar from the syrup has not been a success, on account of the difficulty of crystallizing it.

The Northern Spy in New Jersey. I. J. Blackwell, of Titusville (N. J.) Nurseries, writes: "This is justly considered one of the finest apples to be found in our markets. In size, color, and quality it is all that can be desired. It seems to be a fair but not heavy bearer here; and unfortunately in this section it ripens in September, and will not keep through October. The Tompkins Co. King is a September fruit, and the Rhode Island Greening ripens early in October, and will not keep through November. Many of the fine Northern apples lose their late-keeping qualities here. The Fameuse or Snow apple ripened this year in August."

An Egg within an Egg.—"R. C.," Philadelphia. Such cases occur now and then. We have seen several, and they are frequently reported.

Wheat Growing in Kentucky.—"O. B.," Bogle Co., Ky. The practice of growing two crops of wheat in succession, then clover for hay, followed by clover for pasture, and again commencing with wheat, will soon wear out the richest land. On your best limestone soils you might by feeding the clover and spreading the manure thus made, and then pasturing and plowing under a good sod, raise one crop of wheat every third year, but we doubt if you can raise two crops in succession for many years.

Corundum.—Will the gentleman who several months ago sent us specimens of Corundum kindly inform us what locality they are from?

Renting a Small Farm.—"J. O. B.," Pa. It is better as a general rule to rent a farm either for a money rent or for half the grain than to hire it worked, when the owner can not supervise it himself. Upon 27 acres it will hardly pay to keep a pair of horses and hire a man steadily. There is not sufficient work to keep them from "eating their heads off," unless it is a market garden, and then there would be more than they could do. An ordinary farm of that size might make a living for one man, but it is too small to make any profit for an owner who has to hire labor.

Bois d'Arc.—A Louisville (Ky.) paper publishes a long article on the wonderful qualities of the Bois d'Arc tree of Texas, and it is now going the rounds. If the article had only stated that what is called Bois d'Arc and Bodock in Texas is elsewhere known as Osage Orange it would have been more sensible.

Forcing Rhubarb.—"J. B.," Chicago. It would be a waste of money to put up a house for forcing rhubarb in winter. A hot-bed will answer every purpose. As the tenderest stalks are produced in the dark, a pit containing a plenty of fermenting manure covered with boards will give as good results as a more expensive arrangement.

Report of Swine-Breeders' Convention.—"J. J. D.," Sabina, Ohio. For this report apply to Col. F. D. Curtis, Charlton, Saratoga Co., N. Y.

Remedy for Potato Blight and Rot.—"D. C.," Berkley, Mass. We know nothing about this save what is given in the circular. The statement that insects are the cause of the potato disease is absurd, even if supported by the statements of members of Congress. We do not use or advise the use of or advertise any manures unless we know their composition.

For South Carolina.—"R. A.," Laurens Co., S. C. Merino sheep are more suitable for South Carolina than Cotswold. The latter thrive better in a colder climate. Essex pigs would probably suit your

climate best, Berkshire next, and the Poland-China would not be suitable. In size, these pigs rank in the order in which they are mentioned, the first being the smallest. The muzzle shown in the *Agriculturist* of October, 1872, is the best preventive of ribbing we know of. Morgan horses are generally dark bay or brown. Orchard grass would probably be the most suitable grass for South Carolina. It needs a rich, dry soil.

Hennery Wanted.—"C. C. M.," Greenwich, Ct. We do not know where there is a hennery on a large scale carried on expressly for the production of poultry and eggs for market. If any of our readers know of such a one we should be glad to learn of it, for our own sakes as well as for the information of our correspondent.

Plant Trouble.—"Western Subscriber," Ill. is troubled by flies which deposit eggs in the earth of flower-pots; these hatch into small white maggots, which injure the roots. Try watering with perfectly clear lime-water. We have tried this in some cases for earth-worms without injury to the plants. Whether it can be used for all plants we can not say.

Cancer in the Eye.—"S. W. L.," Oskaloosa. We know of no cure for cancer in a cow's eye except removal of the eye, which could only be done by a surgeon.

Cabbages for Seed.—C. N. Brown. Cabbages from which seed is to be raised must have the stump preserved quite as carefully as the head. Some set them in trenches deep enough to hold the whole cabbage, and when they are a little frozen cover them plentifully with litter to keep them at a uniform low temperature. Others open a furrow, and set in the cabbages inclined one upon another in the direction of the furrow, and carefully cover the stumps with earth. When freezing weather comes on, earth is drawn up to cover the heads sufficiently to prevent freezing and thawing.

Corn in Egypt.—G. W. Caunnack, Ashley, Ill., which is down in Egypt, sends us some figures of his corn crops to work up. He says he shelled 20 ears and the corn weighed 13½ lbs. He plants four feet apart each way, with two stalks to a hill. He gets from one to six ears to the hill, and the corn weighs 66 lbs. to the measured bushel. From these figures we get the following: At 4x4 feet there are 2,722 hills to the acre; allowing three ears to the hill as an average there would be 8,166 ears. If 20 ears weigh 13½ lbs. there would be 5,406 lbs. of shelled corn, at 56 lbs. to the bushel, equal to 98 bushels per acre.

A Cultivating Harrow.—"W. E. M.," Clay Co., Minn. As the object of cultivating is to loosen and mellow the soil, as well as to destroy weeds, the use of a roller immediately after a cultivator or harrow would neutralize both these effects, and would therefore be inadvisable.

Shrinkage of Corn.—"D. W. H.," Utica, Mo. It depends somewhat upon the kind of corn how much shrinkage there will be in drying. A variety with a large cob would shrink more than a smaller variety. Southern or Western Dent corn will shrink 25 per cent in drying, and flint corn about 18 to 20 per cent.

Three-Horse Clevis.—"F. C. Wright." The clevis of which you send a drawing and description is patented. Persons making and using it are therefore liable to the owners of the patent right for infringement.

Lucerna (Alfalfa).—"J. K.," Wilmington, O. When a good plant has already a good name by which it is widely known, it only leads to a confusion of ideas to give it a new and incorrect name. The plant now frequently called "alfalfa" (its Chilian name) is lucerna, and is widely cultivated in Europe as a green forage plant. It would doubtless succeed very well in Southern Ohio, but needs a deep rich soil for its profitable culture. It will stand several cuttings in a year, and last several years. The advertisement of the Rev. J. Copeland which you send to us is a genuine affair, and no humbug.

Moles.—"M. A. S.," Warrenton, Va. We have not been very successful in getting rid of moles. The latest remedy we have seen is to make a dough of meal mixed with arsenic; make a hole in the run, and drop in a pill as large as a marble; then cover the hole to exclude light. This, if followed up, is said to destroy them—but we have not tried it.

Easter Flowers.—It is estimated that the floral decorations in the New York City churches on

Easter Sunday cost a total of upwards of thirty thousand dollars! A small portion of these only are purchased by the funds of the churches, the greater part being voluntary gifts by wealthy attendants.

Mole or Drain Plow.—"G. E. S.," Union Co., Pa. R. H. Allen & Co., Water st., New York, make a plow that loosens the subsoil at a depth of 14 to 18 inches, which they call the Miner subsoil plow. The use of this plow, which can be drawn by two horses, will probably be as satisfactory in drying the surface soil as the more costly and heavier mole plows.

Hitching Horses.—"H. B. A." It is not safe to hitch a horse to a weight. We would not hitch a colt in that manner. The heavier the weight the nearer the approximation to safety, until the weight is so heavy that the horse could not move it. The flatter the weight the better it would be, and 50 lbs. would probably be safe under ordinary circumstances. A firm post as high as the horse's head is the safest thing to hitch to.

Bee-Stings.—"W. A. B.," Bridgeport, Ct., writes: "The best thing I have ever tried for bee stings is to first pull out the sting, and then take a small tube, the end of a hollow key for instance, and firmly press round the sting for a short time. The reasons for its action, I think, are two: first it presses out the poison, second it bruises the flesh so as to partly stop its spreading. It must be done very quick to do any good. I have tried it, and a good many other remedies, and this has done the best."

Stable Floors.—"H. B. M.," Providence, R. I. A plan of laying a stable floor which is water-proof, solid, and permanent, is described in the *Agriculturist* of November, 1873, page 415.

Pure Butter for 3 cts. a Pound.—"J. K." If farmers, who should know all about butter, can be induced to believe that it can be made in any other manner than from cream, or by the use of powders or any other mixture, and to pay \$1 for the secret, they richly deserve to be swindled, because they become, by trying to make butter in such a way, nothing better than swindlers themselves.

Lice upon Chickens.—"Mrs. S. A. P.," Alpine City. Chickens are everywhere subject to these parasites, which when numerous are frequently fatal to the chicks. The remedy is to grind up some sulphur and lard very fine, and rub the ointment upon the chicks' heads and beneath their wings. Severe heat in a dry climate is a cause of many troubles to young chickens. In such circumstances they should be provided with shade, plenty of water, and green food, such as lettuce, chopped cabbage, etc.

Butter from Suet.—"S. D. J.," Wilmington, Del. It would be useless to give the process for making suet into a substance resembling butter, because it is subject to a patent, and therefore could not be used without paying for the patent right. Whether the process is worth paying for or not is a question we can not answer.

Preserving Meat in Summer.—The refrigerator has come to be indispensable to the comfort of the household. Soft butter, sour milk or cream, tainted meat, and dry, shrunken bread are no longer tolerated in any family whose means enable them to procure a refrigerator. In these, as in other things, there are some requisites necessary for perfection. That perishable articles may be kept from spoiling during hot weather, the cooled atmosphere in which they are kept should be dry. Moisture rapidly produces taint and decomposition, and it is because of the abundant moisture in ice-houses that meat or butter so soon spoils in them, and that vegetables become moldy. Mold is generated with rapidity only in moist atmosphere. In dry air the mold plant can not grow, neither can flesh, fruit, or vegetables spoil. For these reasons the refrigerator should be so arranged that the inside air, while it is cooled by the ice, should not be in contact with it. A refrigerator upon this principle is made by A. M. Lesly, of New York, and is known as the "Zero." The ice is in an upper chest, from which water, as the ice melts, passes through a charcoal filter, and is collected in a reservoir, from which it is drawn by a tap in the front. Upon one side of the ice chamber is a deep chest for milk or bottles of liquid. Below is a close chamber, which has no communication with the ice above; consequently the air in it is dry. What moisture it may have contained is deposited upon the cold walls of the ice-box, from which it trickles through a pipe in which is an air-trap, and is discharged into a pan placed underneath.

Apples in Sawdust.—A "Subscriber" writes that he found sound apples last October in a box in which they had been packed in dry sawdust the fall before. Sawdust is no doubt a good material in which to pack fruit, provided it is from wood that has no unpleasant odor.

Sheep Tick.—"M." Melery, Iowa. The reddish insect which infests sheep is the sheep-tick. There is no better method at this season when dipping is out of the question than to go over the sheep and kill the ticks with a pair of small scissors, crushing the eggs that are found like little brown balls, at the same time, between the points of the scissors. We have gone over 100 sheep a day in this way, and few ticks have escaped. They will be found mostly about the sides and brisket.

Horse and Cow Stables.—"J. A. E.," Baltimore. In the *Agriculturist* of December, 1872, there was a plan of stable for horses and cows in a basement building, which may probably be what you want.

Raising Pork in California.—"H. A. W.," Hay Fork Valley, California. With pork at ten cents a pound it ought to pay well to raise hogs. If clover can not be grown in California, at least alfalfa (lucerne) can be, and that makes an excellent green feed for hogs. Potatoes, oats, barley, and rye all make good feed, and wheat if boiled with potatoes would also answer excellently.

The Jersey in the Dairy.—"E. K.," Whitewater, Wis., sends the following statement of the production of butter by a Jersey cow during last season. The cow had just dropped her third calf, and was four years old, and during the month of May was injured in one teat by another cow stepping upon it. The yield was as follows: March, 40 lbs. 10 oz.; April, 41 lbs. 10 oz.; May, 31 lbs. 10 oz.; June, 39 lbs.; July, 33 lbs.; August, 31 lbs. 4 oz.; September, 35 lbs.; October, 26 lbs.; November, 20 lbs.; December, 17 lbs. 4 oz. The total production for the ten months was 315½ lbs., or over one pound per day on the average. During the last two months 24 native cows, two of which were fresh, and all of the others had come in since the Jersey, made on an average 12½ lbs. per month, and the Jersey made under exactly the same treatment 18½ lbs. per month. He thinks this a fair test of the dairy value of the Jersey.

Concrete Pipe.—"M. O. B.," Nunda, N. Y. There must be some mistake in procuring the proper kind of cement or the pipe could not have failed. There are hundreds of miles of cement pipe laid in the country; several miles of it have been laid by the superintendent of the Onondaga (N. Y.) salt works with entire success. We have also had no trouble in laying cement both for a cistern and pipe.

Underdraining.—"C. W. H.," has a farm of 172 acres, one mile from Columbus, Ohio, that he wishes to drain. It slopes to the east with a smooth surface; has a fall of 10 feet in 1,100 feet. Soil, on two thirds of the farm, clay, the other third black. He asks what is the best material to use. He can get pipe tiles, 3½-inch bore, at 35 cents per rod; flat stone, 75 cents per perch; burr-oak lumber suitable for draining, \$20 per M. Can get second-class sewer pipe, two feet long and six-inch bore, at \$1 per rod. We would very earnestly advise him to use tiles. Taking everything into consideration—ease of laying, durability, and efficiency—they are far cheaper than anything else. For the sub-drains 3½-inch tiles are not needed; two-inch pipes are large enough. A very common mistake is to lay the main drains with two small tiles, and the sub-drains with tiles needlessly large. For a main drain the six-inch sewer pipes would be excellent, and would carry off an immense body of water.

Remedy for the Curculio.—"M. M. Ostrand." There is no plan or device for protecting fruit from the curculio worth anything except the plan of jarring the trees and catching and destroying the insects. All methods by hanging such things as corn-cobs soaked in syrup or in carbolic acid even in the trees are as ineffectual as trying to catch old birds with chaff.

Cross-bred Pigs.—"C. W. H.," Columbus, Ohio, writes: "I have crossed a thorough-bred Essex on Poland-China sows. The pigs are very fine."—We should expect a very useful class of pigs from such a cross. One or two more crosses with Essex may be used with advantage.

The Star Thistle.—"Senex" writes: "Dear Mr. *Agriculturist*; I wish to follow up your remark about *Centaurea Americana* as a well-known cul-

tivated plant. Being older than you are, I can remember a long way back. About forty years ago we used to have this showy annual in our country gardens. Nuttall introduced it into cultivation from Arkansas. Barton figured it at Philadelphia in 1822, and Don in England in 1831, since which I suppose seeds have always been in the market and the plant in many gardens. Lately, Thompson, of Ipswich, England, raised a particularly good variety of it from E. Hall's seeds, gathered in Texas, and this has given the species a new start."

After Ruta-bagas.—"C. A. K.," Arlington, Mass., writes that he has raised three hundred bushels of ruta-bagas upon half an acre. The best crop that can follow these roots is rye or wheat, with grass and clover. The best rotation when roots are raised is corn, oats, followed by turnips the same season, or ruta-bagas or mangels the next season, and finally wheat or rye, with grass. But several hundred bushels of roots can not be taken off from an acre of ground without exhausting the soil; and the reason that your crops have failed after the ruta-bagas is probably for want of the needed fertilizer. Two hundred and fifty pounds of fine bone-dust or of superphosphate, with a few loads of manure, might have told a different tale.

Coughing and Wheezing Hogs.—"L. C." It is not often that hogs suffer from cold. They more frequently suffer from too much warmth and insufficient ventilation. Then a sudden change of temperature affects the lungs or bronchial tubes, and coughing and difficulty of breathing result. When so affected, rubbing the throat and chest with turpentine has been found beneficial, but generally a change of food from grain or meal to boiled potatoes or turnips, with the removal of the cause of the trouble, will remove the complaint.

China Geese.—"J. H. S.," Logan, Ind. The only distinguishing characteristic of the Chinese gander is its shrill voice, which is so marked as to be readily noticed. The marks of these birds are alike in both sexes.

Reclaiming a Swamp.—"Inquirer." There is a process known in agriculture as "paring and burning," which might in some cases be usefully employed in reclaiming swamp lands after they have been drained. Draining is the first thing absolutely essential. Then with a sharp broad-sharred plow turn a broad furrow three inches thick, thus cutting all the roots of bushes, weeds, and tussocks. The sods remain until dry, when they are cut with a broad axe into lengths, and are piled into heaps and burned. The ashes are scattered over the bare surface, which is then sown to grass. Timothy and red-top would be suitable for such a soil. The seed may be harrowed in with a sharp light harrow. This is costly, but where meadow land is worth \$100 an acre it pays. We have succeeded in this way, without burning the sods however, using them with lime for compost for uplands, and lining the drained and cleared swamp with 50 bushels of lime per acre. Timothy grew four feet high upon the new soil.

Use of Swamp Muck.—"I. H. P.," Lexington, Ohio. Swamp muck is of considerable value, when free from sand, as an absorbent in the stable and a help to the manure pile. But it should be dug some months, frozen, and well dried before it is used.

Butter from Sweet Cream.—"A. B. L.," Greene Co., N. Y. There is no method of making butter from sweet or any other cream but by churning in the usual manner.

A Rough-coated Horse.—"A. B. L.," Leeds, N. Y. A rough, staring coat upon a horse is a symptom of ill-health. A change of food is often sufficient to restore the smoothness of the coat. Boiled oats or scalded bran, with a few handfuls of linseed-meal mixed in, and fed cold, may be given along with some mild alterative or tonic medicine, such as half an ounce of sulphur or one dram of copperas daily in the food.

Muzzle for Crib-Biter.—"B.," Perryville, Ill. The muzzle referred to in *Agriculturist* of October, 1872, is not made by any one person in particular. Any blacksmith or wire-worker could make one in half an hour. Very stout wire or light band-iron should be used, riveted where the pieces cross each other.

The Japan Pea.—In reference to this pea, which was described in the Feb. No., 1874, Mr. J. Niel Stribling, Anderson Co., S. C., writes:—I raise the Japan pea as a field crop; the yield is much larger than that of any other pea. I cut the stalks for forage and grain, just before they are entirely ripe, in order to get

the best feed, and thrash in a thrasher. The finer part I take for hay—my cows are very fond of it. To save seed, the top of the plant is taken as it ripens first, and it must be stored in an airy place immediately after cutting, else the sun will pop open the pods. Cultivation, soil, &c., are the same as for cotton. Its maturity is the same as that of the cotton plant. It is a good table pea if soaked twelve hours in salt water before cooking."

Treatment of Lampas.—"J. L. G.," Sappington, Mo. The swelling of the bars of the month is sometimes caused in young horses by the cutting of the teeth, in which case scolding the swollen parts lightly with a sharp knife will cure it, or, what is better still, touching them with lunar caustic. In old horses it occurs from overfeeding with corn or other grain, when a change of food and cooling medicine should be given.

The Ecrase.—"B. G. L.," Lakeville, Mass. The above-named instrument for castrating colts without loss of blood, is made by D. W. Kolbe, Philadelphia, instrument maker to the University of Pa.

Treatment b.—"D. M.," Salem Co., N. J., reports the following successful treatment of scab in his sheep. He si applied kerosene oil with the squirt-can of his thrashing machine to every scabby spot, carefully going over the flock. He also gave each sheep daily, for a week, half an ounce of sulphur in meal. The lambs were treated the same as the sheep. The result was a complete cure in the course of two weeks.

Jersey and Alderney.—"J. W. A." The unfortunate confusion of ideas as to the proper nomenclature of these cattle will probably exist for some years to come, and make it necessary for this oft repeated statement to be re-repeated a hundred times. Alderney was formerly understood as referring to any cattle from the Alderney group of islands, Jersey, Guernsey, Alderney, and Sark. As the cattle are really distinct breeds, and have been very strictly kept so for many years, the name of each island now, and has for some years been given to its own particular breed of cattle. Jersey and Alderney are therefore two distinct breeds. The same trouble is now laying up in regard to Dutch or Holstein cattle, which are Dutch only when they are large, black and white, heavy-milking cattle from Holland, and Holstein when they are red, brown, and other colored beef cattle from Holstein.

Time to use Plaster.—"A Reader," West Shelby, N. Y. Plaster should be used in the spring as soon as the growth is fairly started. As 400 parts of water are required to dissolve one of plaster, and it is very heavy and readily carried in loose soil beneath the reach of the plants, it is only when there are copious rains or dews that it produces its best effects.

Patching Old Roofs.—"C. H. P." It is unsatisfactory business to patch old shingle roofs with roof paint of any kind. Better put on a new roof at once.

Flax.—"T. G. A.," Nemaha Co., Kansas. Flax may be made a very profitable crop upon rich bottom land if proper care is given to it. The soil must be very clean and free from weeds. If grown for seed only a bushel should be sown per acre, as the thinner the crop the more the plant spreads, and the larger and better the crop of seed. A fair yield is twelve to eighteen bushels of seed per acre. It should be sown early, or about the time of sowing oats.

The Peach Prospects.—Knowing the desire of both producers and consumers of peaches to have the earliest reliable intelligence from the great peach center, we have requested a gentleman who has unusual facilities for procuring information to keep us advised of the prospects. The following is the outlook up to the time of our going to press—April 15th:—I am in almost daily communication with prominent fruit raisers in all parts of the great peach-growing districts of Maryland and Delaware. The reports are somewhat conflicting as to Delaware. In the lower part of Kent and Sussex counties the trees have been in full bloom for some days, as they also have in the following counties in Maryland, all large peach-growing districts—Queen Anne's, Caroline, Talbot, Dorchester, Worcester, Somerset and Wicomico. These are the southern counties on the eastern shore; but few peaches raised on the western shore. The prospect in the above named counties, the most southern part of the peach districts, is only fair, as we have had much cold weather, with ice, sleet, and several severe frosts, seriously affecting the crop in the inland orchards. Those orchards located on

or near our bays, rivers, or inlets, are not affected so much by frost and sleet. Notwithstanding all this, the prospect is that there will be an immense crop of fruit shipped from those districts the coming season. In the upper part of Kent and New Castle counties, Del., the upper part of Queen Anne's, Kent, and Cecil counties, Md., the trees are not yet in bloom, and the prospect was never better for an immense crop of peaches. The question now among our people is to know what to do with the fruit if the crop should prove as large as the present prospect would indicate. Already capitalists are on the move, and canning houses and Alden drying establishments are springing up all over the country, and with all these increased facilities, if the present prospect holds good, peaches will be thrown on the market in such quantities this season that the prices will rule low, and nothing but prime fruit be worth shipping. While there may be failures in some localities, the prospect, on the whole, was never better for a great crop. The prospect for small fruit crops is good. Eight years ago we did not ship one car-load of berries a day. In 1873 we shipped on the Delaware railroad as high as sixty-five car-loads of strawberries a day.

Books Noticed.

Our publishing friends must excuse us. In the spring months we are so crowded with purely agricultural matters that we have been unable to acknowledge their favors. We can only give the briefest mention.

FIELD ORNITHOLOGY, Comprising a Manual of Instruction for Procuring, Preparing, and Preserving Birds, and a Check List of North American Birds, by Dr. Elliott Coues, U. S. A., Salera, Naturalists' Agency. This title is so descriptive that little need be added to indicate the contents of the work. It is by one of the best of our practical ornithologists, and written in such a plain and direct style, and withal so full and complete, that it makes just the work needed by both young and old ornithologists. Price \$2.50.

PLEASANT TALK ABOUT FRUITS, FLOWERS, AND FARMING, by Henry Ward Beecher. New York: J. B. Ford & Co. The publishers do well to issue a new edition of these "Talks," most fitly called "pleasant." There are a few additions to the first edition, which we well recollect as one of the most charming books we ever read. Mr. Beecher's writings, speaking horticulturally, are not only perennial, but evergreen, and are just as good in 1874 as they were in 1859. The author has the advantage over many who write about horticulture in possessing the not common qualification of knowing something of his subject. These articles are not only bright and cheery, but practical and sensible—in other words, they are Beechery.

JENNY JUNE'S AMERICAN COOK BOOK, by Mrs. J. C. Croly, N. Y. American News Co. The author of this work is well known in literary circles, and her name would predispose one in its favor. Unfortunately a cook book can not be fairly judged by merely reading it; as with a servant one must try it in the kitchen in many ways before deciding upon its value. The lady who presides over the writer's culinary matters says the book "seems promising," and this confirms our own impression. The general directions are marked by eminent good sense.

FLOWER OBJECT LESSONS, or First Lessons in Botany, a familiar description of a few flowers, from the French of M. E. Le Maout. This is a portion of a work by a well-known French author, translated by Miss A. L. Page, Danvers, Mass. With a good teacher this book may be of use in the lack of a better, but notwithstanding the "testimonials" printed with it we think it a very indifferent work. One of its claims is that "not a technical word is used," which strikes us as of no advantage, as common words are strained out of their meaning and applied to things which have "technical" names and no other. If we wish a child in the garden to bring a rake, we do not call it "a piece of iron to which teeth are fixed at right angles, and furnished with a handle," but make the child learn that the proper name for the thing is rake. Yet this circumlocution would be no more nonsensical than the "powder wands" of this book applied to stamens. The fact is that these bodies are peculiar, and they occur only in flowers, and their proper name is stamens, which is just as easy to learn, being but one word, as "powder wands," two words incorrectly applied, and which the child will very soon have to unlearn; many stamens, as it will soon find out, have nothing "wand"-like about them, and much pollen is not powder. Equally absurd is it to call the pistil "column" and "central organ." We are heartily in favor of making the study of plants plain and attractive to children, as has been done by Dr. Gray and Miss Youmans, and which has been attempted without very great success in this book.

EASY LESSONS IN NATURAL SCIENCE, by R. E. Kremer. Philadelphia: Claxton, Remsen & Haffelfinger. What real use this book can serve we are unable to see. It may help one of those stupidities that an inscrutable Providence sometimes allows to stand in the place of a teacher to cram a child's head with fragmentary, disjointed, and useless answers to equally fragmentary and useless questions. To be repeated without any more knowledge of the subject than a parrot. We could fill a page with the absurdities of this book, but a few examples must suffice. Under "Salt" we find "What is common salt?" *Ans.*—"It is a substance used for seasoning or preserving meats, vegetables, butter, and other articles of diet;" and this is all that the child is taught as to what salt really is. Under "Apple" it is asked, "How many varieties are known?" *Ans.*—"Over two hundred." We can not see that this is an important part of a child's education, but as the book professes to teach science, it should approach accuracy. The fact is that one American book describes over two thousand, and does not include all the varieties known. The "vegetable kingdom" is disposed of in just one page, and how full of wisdom that page is may be seen from this: "What great naturalist prepared the system of Botany which is now in use?" Behold the answer!—"Linnæus of Sweden"!!! Mr. Kremer, we would advise you to cram yourself better before you attempt to teach children matters about which you appear to know absolutely nothing. Your book is Bosh.

THE CARPENTER'S AND BUILDER'S ASSISTANT, by Lucius D. Gould. New York: A. J. Bicknell & Co. This is a very concise treatise upon the principles of carpentry, and includes with others the now popular system of balloon framing. The illustrations are exceedingly neat, and the descriptions though brief are clear, and the work can not fail to be of great use to the carpenter who wishes to work by rule.

Catalogues Received.

Our friends who come so late must be content with a very brief acknowledgment of their catalogues, as we have not space for more.

SEEDS.

J. H. & W. E. CONE, Hartford, Ct., with their catalogue of Wethersfield seeds, give a farmers' almanac.

A. S. JOHNSON, North Chili, Munroe Co., N. Y.—Seed Potatoes a specialty.

W. B. DIMON, JR., Brooklyn, N. Y.—Vegetable and Flower seeds.

MILLER & SIEVERS, San Francisco, Cal.—Californian and Australian Tree and Flower Seeds.

H. W. WILLIAMS & SONS, Batavia, Kane Co., Ill.—Flower and Vegetable seed catalogue and a Potato circular. Also Greenhouse and Bedding Plants.

JORDAN HORTICULTURAL COMPANY, St. Louis, Mo.—General Stock of Seeds, Florists and other Plants, and Horticultural Goods.

NURSERIES.

L. B. CHAPMAN, Portland, Me., and 145 Fulton st., N. Y.—Small Evergreens a specialty.

J. & W. J. JUDEPIND, Edesville, Kent Co., Md.—Amazon Raspberry a specialty.

J. W. MANNING, Reading, Mass.—Fruit and Ornamental.

FRANK FORD, Ravenna, O.—Hoosac Thornless Raspberry a specialty.

THOMAS MEEHAN, Germantown, Pa.—Ornamental Trees and Hedge Plants especially.

JONATHAN A. HOLMES, Polo, Ogle Co., Ill.—Apples and Small Fruits.

CALKINS & BROOKS, Bricksburgh, N. J.—Peach and other fruits.

A. D. PRYAL, Oakland, Cal.—General Nursery and Greenhouse stock.

E. Y. TEAS & Co., Cascade Nursery, Richmond, Ind.—Fruit and Ornamental, with extensive Greenhouse stock. Roses a specialty.

PINNEY & Co., Sturgeon Bay, Wis.—Manual of Evergreen and Forest Trees, accompanied by a Catalogue of the same.

FLORISTS.

B. P. CRITCHELL, Cincinnati, O.—A very full catalogue. THOMAS MEEHAN, Germantown, Pa., has added extensive greenhouses to his nursery, and has a full stock.

A. WHITCOMB, Lawrence, Kansas.—This is a charmingly neat catalogue.

WM. H. PAGE (Wm. B. Hovey, Agent), Norwich, Ct.—Flowers & Vegetable Plants.

W. B. DIMON, JR., Brooklyn, N. Y., sends with his catalogue a fine little chromo.

MARION WELSH, Mt. Vernon, O.—Vegetable Plants and Hardy Shrubs, in addition to a full florists' stock.

GEO. W. PENNEY, Newark, O.—Vegetable Plants also.

A. HANCO & Son, Red Bank, N. J.—Bedding and Rare Plants.

H. P. CLOSSON, Thetford, Vt.—Bedding and Greenhouse Plants and Fruit Trees.

EUROPEAN CATALOGUES.

CH. HUBER & Co., Hyères, France.—Rare Plants, Palms, Cannas, etc.

ALEGATIERE, Lyons, France, offers several new double Pelargoniums and Carnations.

ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey, Eng.—This nursery is celebrated for its Rhododendrons, Hollies, and other select plants, and has supplied the finest collections in this country.

F. K. BELL, Stratford upon Avon, Eng., sends a catalogue of his Imperishable Labels, which, from the locality we presume, he calls "Shakespearean."

J. B. GUILLOT FILS, Lyons, France. A catalogue of roses remarkable for its great number of novelties and standard varieties.

NOTE.—We have several duplicates of the catalogues of Anthony Waterer & Guillot Fils, which may be had upon inclosing a stamp to the editor.

IMPLEMENTS.

A. J. NELLIS & Co., Pittsburg, Pa.—Harpoon Hay-Forks.

E. S. LEE & Co., Rochester, N. Y.—Pruning apparatus.

J. J. THOMAS & Co., Geneva, N. Y.—A catalogue setting forth the merits of the well-known Thomas Harrow.

Bee Notes.

BY M. QUINBY.

SOME OF THE OBJECTIONS TO BEE-KEEPING CONSIDERED.—It is well known how much honey is yielded by certain districts in the state of New York. Taking this as a basis and making proper allowance for waste land and other non-producing portions of the area, it is estimated that in this state alone twenty millions pounds of honey are annually wasted for the want of bees to gather it. At the present time instead of stating any arguments in favor of making an attempt to secure this important item in our resources by extending the knowledge and the practice of bee-keeping, it may be well to consider some of the objections that have been made to the pursuit.

Much has been said in opposition to bee-keeping, and said judiciously if it is not proved a legitimate and profitable business. Several writers in the newspapers are manifesting a good deal of interest from professedly disinterested motives. Early in March a little item appeared in the N. Y. Tribune, pretending to be a fair report of a bee-keepers' convention. I failed to discover wherein it was fairly represented. It seemed to me to be especially designed for the purpose of discouragement, by giving only the dark side. Was there nothing said that might have been some benefit? The name "bee merchants" was given to the members. Not more than two or three of the whole number ever bought and sold bees. One especially, that has secured more honey than any one in the state, never yet sold a bee. What constitutes a merchant but buying and selling? Is it just to represent the convention thus? There is about 100,000 pounds of honey sent to New York city annually. The man referred to has furnished about one fourth of it. Now suppose this man who knows how to manage bees successfully attends the convention and teaches his fellows how to manage until five or ten times the quantity is sent to market. The price it now bears would be lessened, and if he did not get his reward on a broader principle than pecuniary remuneration, I think he had better be silent. Where there is an interest, I hope there will be an impartial investigation.

Prof. C. V. Riley, of Mo., has had much to say against the bee. A private correspondent wishes to know what I "have to say to these charges." With regard to the injury bees do to fruit, it would be about the same in substance as was said last month. Prof. Riley seemed desirous to convince his readers that bees injured fruit without positively asserting it. Such words as "I am convinced" and "there is no doubt of it" may reach far enough to convince many readers that he has seen what he speaks of, when he has not committed himself to a positive expression. His proposition to poison the bees is one so repulsive that I abstain from any comment here. His plan to annihilate them by sowing milk-weed shows that he has not investigated the matter. My views on bees and milk-weed were given to the public over twenty years ago. I would not alter them now further than to say that the more that milk-weed was sown near my bees,

the more prosperous I should expect them to be. I have had opportunities of watching more closely since then where there were acres of milk-weed, and bees by the hundred colonies kept in the vicinity, which prospered as finely as any that could be found. The flowers of the weed have a peculiar shape, as well as an appendage that becomes detached and adheres to the foot of the bee, which becomes hooked to the flower when at work and held fast. But it will be found that not over one bee in a thousand is caught fast.

When we had the old box hive, and it was only part full, a few—a dozen bees or so—might be seen on the bottom board in the morning unable to get on the combs above them, because of this adherence to their feet. But very few of the whole number were disabled thus, as was proved by the quantity of these appendages that was worked off of the feet of those in the cluster overhead, that had ascended. Handfuls mixed with scales of wax might be scraped up, proving to me at least that only a small portion of the bees that work on milk-weed are lost. If it should be established that getting honey from the flowers of milk weed did not kill the bees but was rather a benefit to them, the absurdity of the Prof.'s recommendation to sow the weed is evident.

The injury bees are alleged to do to the flowers of fruit, grain, and grass, may be discussed another time. If the objections against bee-keeping are greater than the inducements to undertake it, of course it is better not to commence till these are removed. We think we have recently discovered means to lessen the danger from the dreaded stings, and if we can abandon fear and approach them with a desire to discover facts we shall progress in a ratio quadruple to anything we have done before.

Kentucky Blue-Grass.

BY THE HON. JOHN H. KLIPPART, COLUMBUS, O.

A paragraph appeared in the March number of the *American Agriculturist* from which one would be led to infer that this grass attained its greatest perfection only in a few counties in Kentucky, and that it required a limestone soil on which to flourish in any locality. The fact is that the limestone formation of the blue-grass region in Kentucky extends over Brown, Butler, Clermont, part of Clinton, part of Greene, all of Hamilton and Montgomery counties in Ohio; but for some reason the blue-grass does not seem to flourish so luxuriantly on the Ohio side of the lower silurian formation as it does on the Kentucky side. But in Union, Madison, Greene, Clarke, Fayette, Pickaway, Ross, Franklin, and Champaign counties, in Ohio, the blue-grass grows as luxuriantly and forms as staple a pasture grass as it does in Bourbon or Woodford counties in Kentucky. In the Ohio counties just enumerated the "drift" ranges from five to 150 feet deep; and in some of the counties this drift rests upon black shale, and in others upon the corniferous and Helderberg or Water-line limestone formations. How much influence the bedded limestone or shales lying beneath 150 feet of drift may or does exert upon the blue-grass growing on the top soil I am not prepared to state.

There is no grass which accommodates itself to any given locality with as much facility as does this same blue-grass—it is almost protean in the variations which it assumes according to climate and soil. We find it in southern and central Ohio growing rankly and luxuriantly on gravelly soils; then we find it equally rank on the bottom lands, and it does very well on stiff clay lands. It is the wayside pasture or June grass of Northern Ohio, but it does not do so well nor grow so luxuriantly there as on the gravel soils in southern Ohio.

A writer over the initials "J. L. C." in an article on Kentucky blue-grass, says: "It is one of our earliest grasses, growing, with an upright round stem, from one to three feet high, with three or four long, rich, bluish green, highly nutritious leaves, with a perennial fibrous root, creeping near the surface." This is prob-

ably correct for northern Ohio, but in central or southern Ohio it differs somewhat. There are three or four leaves on the stem, it is true, from two to four inches long; but I have counted as many as thirty radical leaves belonging to one stalk, each leaf longer than the longest one on the stem. In these radical leaves is where the great merit of the plant lies. It is scarcely worth cultivating as a meadow grass or as a grass from which hay is to be made; the radical leaves are too short to mow, and the stems are unfit for hay, being very tough and wiry, so much so that as a matter of fact it is in some localities better known as wire-grass than by any other term. "J. L. C." warns persons not to grow it with clover, giving as a reason that "they are not fit to cut at the same time." If blue-grass is not sown with clover or oats, or some rapid-growing nurse, it will be many a long day before a "set" can be obtained. If sown by itself, the June or July sun will kill the tender plant down to the very roots—at least this has been my experience; but every time I sowed it with clover—and clover is the best nurse for it—I have succeeded in getting a good set. "J. L. C." says: "From the fact of its roots extending near the surface it is easily affected with drouth." Here in central and southern Ohio it resists drouth better than any grass we have. In Union and Madison counties are blue-grass pastures which have not been disturbed by the plow since the settlement of the country, and these undisturbed pastures are the most luxuriant and richest pastures we have. More than fifty years of constant grazing does not appear to have diminished the yield of pasturage. One field in Union county was plowed up some fifty years ago, and several crops of corn grown on it; then it was allowed to become a blue-grass pasture again, but up to to-day any one can see that it is inferior in its production of pasturage to the adjoining fields which were not disturbed by the plow. This is to me conclusive evidence that it is not any more exhaustive than any of the ordinary meadow or other pasture grasses.

A Pigeon Show.

The engraving upon the first page represents the principal prize birds at the first exhibition of the National Columbarian Society recently held in the city of New York. It may be supposed that pigeons are of very little practical use and are unworthy of the notice of persons whose efforts are turned towards producing something useful. But this would be a mistake if for no other reason than that one class of these birds, the carriers, possess a value for their services alone which in some cases can hardly be computed. In the late siege of Paris by the German armies, the mails were frequently carried by these birds, and letters or information either upon political, mercantile, or social affairs of incalculable value were safely sent by their means over the lines of the besiegers. A trained carrier pigeon might easily be the means of deciding the safety or destruction of an army, and thus change the destiny of a nation. Travellers or business men might send a rapid and inexpensive message from a distance or from their place of business to their home, by a carrier pigeon, which might be carried with them for this purpose in a small basket, and many hours of anxiety and suspense be thus prevented.

Besides as pets and ornamental birds they have their place in many a country house, to say nothing of their special adaptation to the

purposes of the pie. We therefore give this prominent place to these portraits from life of probably the most valuable pigeons in the world; for it must be confessed that the birds sent from England for the purpose of exhibition here, as their best, were greatly surpassed by American birds. No. 4, the pigmy pouter, and No. 3, the bronze-wing, are two of these imported birds. They, however, arrived too late for entry and were not therefore in the competition. No. 2, the Antwerp carrier, is a new variety in this country and has already become very popular. These birds have not heretofore been figured; the specimen shown in the engraving is the property of Mr. P. C. Biegel. No. 1, the bald head tumbler, is owned by Mr. H. A. Brown, who entered the five varieties or colors of these birds, which are now almost extinct in America. He received a prize for each color. No. 6, the black swallow, is the property of Mr. T. S. Gaddess. No. 5, the red barb, owned by H. Colell. No. 8, the black trumpeter, owned by T. S. Gaddess. No. 10, a pouter hen, a magnificent bird which took a prize of \$50 and is valued at \$250, is the property of J. Yeudall, Philadelphia. No. 7 is H. Colell's black fan tail; No. 13 is the black English carrier owned by P. C. Biegel; No. 12 the dark almond tumbler owned by A. Scheld; No. 11, the African owl, owned by J. Yeudall; and No. 9, the yellow priest, owned by Mr. Gaddess.

Ogden Farm Papers.—No. 11.

Much has recently been written about large yields of butter, and an active discussion has been in progress on the subject in various agricultural papers. This discussion has revived what I wrote in the Ogden Farm Papers for August last concerning the dairy of Messrs. I. Boics & Son in Illinois. I have recently received a letter from them, in reply to a request for more information, in which they say:

"In our statement to you last spring we think we stated that we made about 300 lbs. of butter per year per cow. We thought so then, and we think so now. We have no means of knowing exactly how much we do make per cow, as we have never yet been able to give the matter a thorough trial. We are milking this winter 132 cows, 84 of which calved in September and October last, 48 having been milked from 12 to 18 months, it being impossible to get some of them with calf. In October last these 84 new milch cows gave an average of 28 lbs. per cow, or something over 2,350 lbs. total of milk, while on January 9th the same cows gave 26 lbs. per cow. The same cows are giving at present an average of 21 lbs. per cow. You will see that there is a great decrease from January 9th to the present time, a part of which is owing to our having to buy hay, and it is not so good as our own, as we take pains to have our hay cut very early. Every year since we have been in the dairy business our cows have given more milk in the middle of May and June than in the months of March and April. In the months of September and October last it took, September, 24 lbs. of milk to make a pound of butter, and October, 21 lbs. January, 23 lbs., and at present we are making from 23 lbs. Therefore, taking the months of May and June at the same average per cow that they are now giving, you will see that the average can not be far from 300 lbs. per cow. We think we can make 300 lbs. from a cow that comes in September 1st as we can 225 from one

that comes in March 1st—both to be milked until they go dry. We intend to weigh all our milk next year, commencing October 1st, and we are in hopes to prove that we can make as much per cow (and as good butter) in Illinois as can be done in the old dairy regions at the East. Our neighbor, Mr. O. S. Tamner, bought 40 cows in the spring of 1873, commenced delivering milk March 1st, and in one year he delivered us 7,212 lbs. of milk per cow, his cows going farrow however."

In their former letter these gentlemen state that they feed their cows "eight quarts of corn and oat-meal (mixed) per day for every day that they give milk. In winter we give them every day, in addition to the meal, a large load of corn in the shuck, also what nice early cut hay they will consume."

The foregoing is a very explicit and exact statement, and there is no reason to question its accuracy.

Supposing the 84 fresh cows to produce, as is stated, from October 1st to April 1st, 4,550 lbs. of milk, yielding about 198 lbs. of butter, we need not strain the point very far to credit them with 102 lbs. for the other half of the year, when they would be mainly at grass, and would each have eight quarts of rich grain feed per day in addition. Mr. Tamner's 40 cows, being left farrow and fattened for the butcher, produced, according to the statement (at 23 lbs. milk for one pound butter), an average of 313 lbs. of butter within one year.

Such a forcing system of feeding is of course hard on the cows. More than one third of the Boies cows failed to get with calf, and with the Tamner cows there was no effort to get them with calf. This process of butter and beef making is closed to those who raise their own stock, but even these may take a hint (to be followed with judgment) from the mode of feeding described.

And what feeding it is! "What nice early-cut hay they will eat" (and hay so good that when purchased hay is fed the cows fall off materially in their yield); eight quarts of oats and corn-meal per day; and a large load of corn in the husk, which must amount to at least 10 lbs. of shelled corn per day for each cow—considerably over a peck of grain per day! No wonder they give large yields of butter and come out at the end of the year beef fat.

There is, too, much more than a hint for Western farmers, who are now groaning under the oppressive charges for the transportation of their corn to the sea-board markets. Why send it at all, you who can feed it at home? Why not make butter or cheese, and from the refuse of the food, and from the skimmed milk and whey make pork, and so put your gross product into a net form? You will get as much for the dairy products and the pork as you would for the corn from which they are made, and will save the cost of transportation on the greater part of your crop.

You will save something else, too—the enormous amount of valuable manure which your corn now makes here at the East and in England. The day has fortunately gone by when an agricultural writer need hazard anything of his reputation by asserting that in Illinois, as well as in all the rest of the world (old or new), the manure question is henceforth to be the question, and that a universal recognition of the value of manure among Western farmers is of the greatest importance to the permanent interests of the country, which depend so much on Western prosperity.

A friend in Maine, writing to congratulate me on the results of my dairying as set forth in the March number, says: "I observe with surprise the large percentage of abortions in your herd—seven out of thirty—and you make no allusion to it as an unusual occurrence. It would be considered so here, and in fact a single abortion is unusual in all this region. In my own herd, varying from twelve to twenty, there has not been an abortion for many years. Is it common with you and in your vicinity, and to what cause is it attributable? If the cause is not certainly known, what are the speculations on the subject?"

Abortion has been common here, but fortunately it is decreasing, and seems to have left my own herd altogether. The speculations on the subject, so far as they have come to my notice, seem to be of no value whatever, and, after the costly investigations that have been bestowed upon it during the past few years, there has been no theory developed which seems to fit the conditions under which it occurs; neither has any effective preventive been suggested, unless it be the one prescribed by Mr. Sam. J. Sharpless, and published some time ago in these papers, and which is worth repeating.

Fig. 1.—SEAT SPRING.

The form of tonic that we have used, and which we think has been effective, is a powder consisting of: 2 oz. sulphate of iron, powdered; 8 oz. ground ginger; 8 oz. fenugreek; 8 oz. caraway; 4 oz. gentian. Dose: A heaping tea-spoonful daily with bran or other feed.

Mr. Sharpless gives this to his whole herd, and during much of the season of pregnancy. We have used it much more sparingly, but with apparent good results. If a cow shows by the swelling of the bearing, by the laxity of the cords at the side of the tail, or by a tendency to spring-bag, that she may be preparing to lose her foetus, we separate her from the herd, give her the powder at once, and give her somewhat stronger food. In every case where we have tried this, for a year past, the indications have disappeared, and the cow has gone regularly on with her pregnancy. The cases have seemed clear enough to show that the powder does good, but it is possible that the epidemic (according to its habit) had run itself out

Fig. 2.—SEAT ATTACHED TO BOX.

and disappeared of its own accord—as mysteriously as it came.

There is abundant indication of the fact that a change is coming over the minds of dairy farmers on the subject of Jersey cattle. In spite of hard times, farmers are making active inquiries about them, and actual sales are in-

creasing every year in numbers and in price. A few years ago bull calves could be bought in plenty for \$25 each at six months old, and for not much more at twice that age. The price now runs for good animals at from \$50 to \$100. I am not now speaking of the demand from breeders of thorough-breds, who pay even as high as \$300 for young bulls of unmistakable pedigree and quality, but of that from dairy farmers. I have recently sent two bulls into New York State, one for \$75 and the other for \$100 (express charges being in each case about \$30), both sold to dairy farmers in districts where Jersey cows are almost unknown, and where they are to be used only on native cattle and for the improvement of the herds of butter-producing farms. For another, which I advertised at \$50, I had seven applications within two weeks. Three years ago I should not have had probably a single one. The meaning of this is that butter-makers are awakening to the knowledge that the superiority of the Jersey breed for the butter dairy is an established fact—not a mere fancy of rich men running after a fashion. It has been sufficiently demonstrated that an infusion of Jersey blood into a herd of native cows will materially increase their product of butter, and will make it easier of manufacture and better in quality. This it does without increasing the size of the cows, and without, therefore, causing a greater consumption of food. Such being the fact, it is not at all to be wondered at that intelligent dairymen who are awake to their true interests should be quick to find it out and be anxious to take advantage of the proffered benefit. The good that is to be done to the country by the dissemination of Jersey bulls to be used for the improvement of common cows is of far more consequence than is that of the extension of the use of pure Jersey cows, for the reason that this latter will, at least for a long time to come, be confined to a comparatively few of the better farmers, while one bull in a neighborhood will make a lasting amelioration of all the well kept herds for miles around. This is an improvement, too, which is sure to extend and increase the more the sterling qualities of this race become known, and it must lead eventually to the wide extension of the pure Jersey cow, which stands in relation to the half-breed as gold does to silver.

An Easy Wagon-Seat.

It is somewhat difficult to adapt a convenient spring-seat to an ordinary wagon with the appliances generally at a farmer's hand. We have, however, recently been shown a spring-seat which seems to combine all the requisites of convenience, portability, ease, and cheapness, which would make it desirable for a farmer to possess it. It is shown in the annexed engraving. Fig. 1 shows the spring to which the seat is attached. The spring, a strong spiral steel one, is contained in a strong but light wrought iron frame. The frame is provided with two hooks, by which it rests upon the edge of the wagon-box—outside of it and out of the way of a load—and is so made that it may be slid along with ease from one part of the box to another. The seat is bolted to the upper part, in which there are two holes made for this purpose. Fig. 2 shows the seat complete, affixed to a wagon-box. This seat is patented, and is made by B. F. Wells of No. 47 Dey street, New York.

The Wild Ass.

Although we rarely find an ass engaged in farm labor, yet indirectly this much maligned animal is of agricultural interest and value. As the sire of the mule he renders an invaluable service, and anything new pertaining to his history is worthy of record. By reason of many sorrows and misfortunes and much ill-usage the ordinary ass has lost much of its original spirit and beauty, and it is difficult to recognize in the graceful animal depicted in the annexed engraving (for which and that of the Poitou Mare we are indebted to the London Field) a creature which we might designate as a pure-bred donkey, a true descendant of the original race. The engraving is a portrait taken from a photograph of a young wild ass, a female, which was recently captured after a chase of forty miles, which was made in 3 hours and 5 minutes, upon the Runn of Kuteh by an English army officer and a party of fifty native hunters. The district in which it was captured is a vast grassy plain, much resembling our own Western plains, in Tartary, and is the native home of the wild ass. These animals are very shy and fleet, and being possessed of great endurance are rarely captured. This is the second instance only of a capture, the first being that of a mare heavy with foal, which was taken after having been wounded, and this, being a young animal only six months old, was only taken after having been disabled by a wound from a spear. A remount of horses also was necessary to make the capture. This proves the native endurance of the race and tends to explain also the fact that our domestic ass so well survives the greatest ill-usage, the most severe labor, the poorest and most scanty fare, that his longevity and freedom from disease have become proverbial. It is a fact worthy of notice that the wild ass (*Equus onager*) is colored differently from its domesticated relative. The animal here shown is white and fawn; the under parts of the body, the neck, chest, and nose, part of the face, the rump, channel, and inside of the legs are white; the mane is short, thick, and dark brown. A dark dun streak of long hair runs along the back, widening towards the rear, and continues down the tail to the end. The rest of the body is of a fawn color; the coat is smooth and glossy, and the tail has a tuft of long dark-brown hair at the end. The legs are clean and flat, the sinews prominent, the feet are small, hard, and well formed, and the pasterns long. The ears are smaller than those of

the tame ass, and are constantly pricked, and the eye is of unusual brightness and quite black. The muzzle is small and black, with large open nostrils. This animal does not have the cross upon the shoulders, which is borne by the domestic ass, and is 12 hands high, although

A WILD TARTARIAN ASS.

now only a year old. As this wild ass is probably the original of our domestic one, it is a curious problem to trace out the causes which have led to the variation between it and the races that have descended from it.

The Poitou Mare and Mule Foal.

We have previously described and illustrated the Poitou Mule, and now complete its history

A POITOU MARE AND MULE FOAL.

by describing the typical dam from which it is bred. Indeed this part of its history is of considerable importance in a national sense. As a large number of these animals are annually imported into this country, it becomes a mat-

ter of interest to know if we can not just as well raise the animals we need ourselves, as pay the foreign breeders for doing us this service, and so have this industry added to those we already possess. As in a family everything made at home, in leisure hours, saves expenditure and adds to the wealth of the household, so in a nation everything that is produced, if it does not interfere with other productive labor, also adds to the general wealth. It is quite plain to us that we need not go to France for such mares as this, and equally so that thousands of mules may be raised in several of our States without hindering any profitable work. If, then, we use the mares we have and devote attention to this business, all we need is to import the necessary animals to start with, and set this industry to work for ourselves. It is questionable, indeed, if we do not already possess equally good animals with the French breeders, and if we could not by using the same care as they do in selecting sires and dams produce equally good mules. We have little doubt of it, and knowing what has been done by our breeders in other respects, and the great success they have attained, it

would be strange indeed if they could not produce exactly the kind of mule needed for every purpose, and render importation unnecessary. It will be seen from the engraving and the following description of the Poitou mares that we have already the material for a home supply. The engraving represents a prize Poitou mare, and a mule foal three months old. The mare is 16 hands high, coarse in bone and heavy in build, and very much resembles the horses common in Nor-

mandy, some of which have been brought to this country under the misapplied name of Peheron. Indeed, many mares have been taken directly from Normandy for mule breeders (*mulassiers*), although both stallions and mares are now brought from England to supply a stock of dams. These dams are rarely used to labor, but are kept almost altogether for breeding. Generally they have colts when three years old, and the idea of the French breeders that very low keep upon straw and similar innutritious food is favorable to the process of gestation, and the safe production of the colt does not tend to improve their appearance, although it may be

effective for the purpose designed. Certainly the pampering of breeding animals is neither productive of prolificacy or hardiness in the dam, nor hardiness in the offspring; but on the other hand there is a judicious mean

which is not wisely departed from. The young mule inherits the heavy limbs of the dam and its size, as also to some extent its coarseness; the capacity for draft being the great object to be attained. On the whole the French system of raising these mules is contrary to what we should consider as exactly proper, and it is quite possible that in a very short period we could surpass them in the character of the animals raised. For instance, the young foal is denied the first milk of the dam, and this frequently results in its injury or early death. Then as soon as the colts are weaned they are sold to farmers, who rear them until yearlings, when they are sold again and again to others who keep only mules of two, three, or four years, as the case may be, until finally they are sold to the foreign purchasers. A more enlightened treatment of the mules could not fail to be of service to them, and it is hardly questionable but that American bred mules would be superior to the imported ones.

Walks and Talks on the Farm.—No. 125.

Mr. S. R. Elder, of Beaver Co., Pa., writes me an interesting letter. "Corn is our surest crop," he says, "and always follows a manured clover sod. We usually get about 70 bushels shelled corn per acre. The next spring we sow oats on the corn stubble. And here our trouble commences. The oats fall down and do not fill, and taking one season with another we do not get more than 35 bushels per acre. I once sowed five acres of oats and peas. They had a splendid appearance when in bloom, but fell down and rolled before they showed any signs of ripening. Now, can you suggest any crop to take the place of the oats and leave the land in good condition for winter wheat?"

In this section wheat does better after barley than after oats. I should try plaster or salt to see if it would not give stiffer oat straw. Sow 200 lbs. broadcast per acre after the land is plowed and harrowed in the spring and before the seed is drilled in. If Mr. Elder has been in the habit of drawing his winter-made manure on to his sod land in spring, and plowing it under for corn, I would try the plan of piling the manure and turning it once or twice so as to thoroughly ferment it, and then draw it out in the fall on to the clover sod and plow this clover sod up for corn next spring. I think the oats that followed this corn crop would not be so likely to fall down as they would be on land where coarse, fresh manure was plowed under for corn. I think oats and wheat frequently fall down, not because the land is too rich, but because it is not rich enough. The trouble is probably due to an excessive amount of carbonaceous matter in the soil, and to a deficiency of nitrogen, phosphates, and potash. One of the best remedies for this evil is to grow more root crops. A crop of mangel-wurzel or turnips will take up this carbonaceous matter from the soil and organize it into good nutritious food.

But it is not an easy matter to hit on the best rotation of crops. If we could only get reliable artificial manures at reasonable rates we could farm to much better advantage. The time will come, and that shortly, when such will be the case. We could then adopt any rotation that best suited our particular circumstances. The old notion that there is any real chemical necessity for a rotation of crops is unfounded. Wheat can be grown after wheat, and barley after barley, and corn after corn, pro-

vided we use the necessary manures and get the soil clean and in the right mechanical condition.

"What, then, do we gain by a rotation?" asked the Deacon.

Much every way. A good rotation enables us to clean the land. We can put in different crops at different seasons.

"So we could," broke in the Deacon, "if we sowed wheat after wheat, barley after barley, and corn after corn."

True, but if we sowed winter wheat after winter wheat there would not be time enough to clear the land.

"Just as much as when we sow wheat after oats, or peas, or barley."

"True again, Deacon," I replied, "but we are supposed to have cleaned the land while it was in corn the previous year. I say supposed, because in point of fact one half our farmers do not half clean their land while it is in corn. It is the weak spot in our agriculture. If our land was as clean as it should be to start with, there is no rotation so convenient in this section as corn the first year, barley, peas, or oats the second year, followed by winter wheat seeded down. But to carry out this rotation to the best advantage we need artificial manures."

"But will they pay?" asks the Deacon.

"They will pay well provided we can get them at a fair price and get fair prices for our produce. If we could get a good superphosphate made from Charleston phosphates for 1½ cent per lb., and nitrate of soda for 4 cents per lb., and the German potash salts for ¾ cent per lb., and could get on the average \$1.25 per bushel for barley and \$1.75 for good white wheat we could use these manures to great advantage."

"Nothing like barn-yard manure," says the Deacon.

No doubt on that point, provided it is good manure. Barn-yard manure, whether rich or poor, contains all the elements of plant-food, but there is a great difference between rich and poor manure. The rich manure contains twice or three times as much nitrogen and phosphoric acid as ordinary or poor manure. And this is the reason why artificial manures are valuable in proportion to the nitrogen and phosphoric acid that they contain in an available condition. When we use two or three hundred pounds per acre of a good artificial manure we in effect, directly or indirectly, convert poor manure into rich manure. There is manure in our soil, but it is poor. There is manure in our barn-yards, but it is poor also. Nitrogen and phosphoric acid will make these manures rich. This is the reason why a few pounds of a good artificial manure will produce as great an effect as tons of common manure. Depend upon it, the coming farmer will avail himself of the discoveries of science, and will use more artificial fertilizers.

I have several times alluded to the experiments of Lawes and Gilbert on barley, giving the main facts. For twenty years barley has been grown year after year on the same land. One plot has been left entirely without manure; one plot has had 14 tons of barn-yard manure per acre every year; other plots have had superphosphate of lime; others sulphate of potash, soda, and magnesia, with and without superphosphate. On other plots, nitrate of soda and salts of ammonia have been used, alone, and in connection with superphosphate, and also in connection with salts of potash,

soda, and magnesia. One plot had 2,000 lbs. of rape cake each year per acre, alone, and also in connection with superphosphate, alone, and in connection also with potash, soda, and magnesia alone, and with superphosphate added. The results of the experiments for twenty years have recently been published. They show that we have much to learn—and, what is equally important, a good deal to unlearn. They are, however, on the whole, decidedly encouraging. They show that great crops can be raised, and that it is well worth a farmer's while to study agricultural chemistry.

The crop on the plot that was sown to barley every year for twenty years without manure produced an average of 23 of our bushels per acre and over 1,300 lbs. of straw. This, in itself, is a striking result.

"It must be very rich land," remarks the Deacon.

"No," I replied, "it is no richer land than yours or mine. It is what we should call a rather heavy wheat soil. It is some such land as my north lot, but I think not naturally as rich."

"When you sowed barley in that field, if I remember right," unkindly remarked the Deacon, "you did not get over 15 bushels per acre."

This was not because the land was poor. It was because it had never been more than half plowed and worked, and was full of weeds.

The plot that was manured every year with barn-yard manure averaged 54½ bushels per acre and over 1½ ton of straw. The smallest yield on this plot during the twenty years was 34½ bushels per acre, and the largest yield 65 bushels.

The smallest yield during the twenty years on two plots which received nothing but the best artificial manures was 33½ bushels per acre on the one plot and 39½ bushels on the other. The largest yield on these two plots was 71½ bushels per acre on the one and 73½ bushels on the other.

"That will do," says the Deacon, "but after all it is not as big a crop as your oats and peas last year. You had 85½ bushels per acre, without any artificial manures."

The year before I had 88½ bushels by weight, reckoning a bushel 32 lbs. This would be 2,832 lbs. per acre. Mr. Lawes's largest crop of barley, at 48 lbs. per bushel, was 3,540 lbs. per acre. This, by weight, is equal to over 110½ bushels of oats per acre.

"I suppose," says the Deacon, "that Mr. Lawes had spent a small fortune in underdraining the land."

"It so happens," I replied, "that this field was not artificially drained at all. The only reason for such large crops was the application, in an available condition, of nitrogen and phosphoric acid. But recollect one thing, Deacon, it is vain for you or for me to hope to get big crops until we make our land clean. In a letter just published, Mr. Lawes, in alluding to the fact that nitrate of soda and superphosphate can be used with profit on the barley crop, well says: 'It is hardly necessary to add that the land should be clean; many of the weeds which infest our fields are quite as fond of ammonia and phosphate as are the grain crops, and if allowed to do so they will appropriate to themselves a very considerable portion of the manure.'"

The Deacon got up to go. I have only to speak of "weeds" to start him at any time.

"Don't be in a hurry," I said, "there are

several letters here that I want you to help me to answer. Here is one from Champaign, Ill., from a gentleman who wants to know how many pigs he can keep on an acre of clover."

"If the pigs have nothing but clover," said the Deacon, "they will eat nearly as much as one of your big Cotswold sheep. They keep eating all the time. But a good deal depends on the breed. And I will say one thing in favor of your black pigs. They are the best graziers I ever saw."

That is simply because they are so quiet and have little offal. Restlessness and offal, like weeds in a corn field, run away with half the food and all the profits. There are pigs that weigh no more in the fall after a summer's grazing than they did in the spring. The great advantage of having well-bred pigs is shown in the pasture lot more than in the pig-pen. I am not sure that a coarse, common, ill-bred hog that has nearly got his growth will not gain as fast after he is shut up to fatten as a well-bred Essex or Berkshire. But turn a couple of such pigs at say six months old into a good clover or pasture lot, and the well-bred pig will not only increase the more in weight, but this increase will consist in a good degree of good solid flesh and fat, while the increase of the other will be principally in bone, water, and offal.

A pig will eat more in proportion to live weight than any other domestic animal. Bous-singault states that a pig from six to eight months old will eat green clover equal to over five pounds of hay per day. We shall not be far wrong in assuming that young clover contains 80 per cent of water, so that a pig would eat 25 lbs. of green clover per day—20 lbs. of which consists of water. If we assume that the pasture will produce in the season clover and grass equal to 2½ tons of hay, an acre would support five pigs for six months.

The Deacon thinks they would not eat so much clover if they were allowed one or two pounds of corn each per day. I think they would eat nearly or quite as much. In one of Mr. Lawes's experiments he gave one pen of pigs 28 lbs. of grain per head per week and all the bran they would eat; and to another pen only 19½ lbs. of grain and all the bran they would eat. But the pigs having the smaller allowance of grain ate no more bran than the other. Both pens ate 18 lbs. of bran each pig per week. And so I think it would be with the clover. The pigs will eat about all the clover they can get into their stomachs, say 25 lbs. per day. But I think they would manage to squeeze in an extra pint of corn night and morning.

"But what is the good?" asked the Deacon.

Let Mr. Lawes's experiment alluded to above answer. The pen that had 18 lbs. of bran (all they would eat) and 19½ lbs. of grain gained 4.16 lbs. per week; while the pen that had 18 lbs. of bran and 28 lbs. of grain gained 7.42 lbs. per week. In other words, 8½ lbs. of extra grain per week produced 3½ lbs. of pork.

The next letter is from a well-known agricultural writer in Ohio. He wants to know what is the best work on agricultural chemistry. I told him to get Prof. S. W. Johnson's works, "How Crops Grow" and "How Crops Feed." "I have not time to go at all deeply into the subject," he writes, "but I am convinced that there must be more science and more brains infused into our agriculture before there can be much improvement or even a check to the

downward progress of our crops and the fertility of our soils."

I have not much fear of a "downward progress." I do not think our soils are being exhausted. I know my farm will produce a great deal more now than it would 25 years ago. Take the field where I am now sowing 14 acres of mangels. Twenty-three years ago it was in wheat. My father, who was a good English farmer, walked over the field with me, and exclaimed, "I never saw such a wretched crop; but it looks like good land." Last year I had a grand crop of corn on this same field. And yet about all I have done to it is to get out some of the stones, plow it better, cultivate thoroughly, and kill the weeds. I have plowed under no clover, have not put fifty loads of manure all told on the whole field until this spring. Now I am putting on eight or ten tons of manure per acre, and expect, with a favorable season, a fair crop of mangels.

"J. S. D.," of Bartholomew Co., Ind., asks "if Diehl wheat is an early or late variety? smooth or bearded? has it stiff straw, and is it suitable for the rich bottom lands of Indiana? Is it liable to be struck by rust or attacked by the fly? Is it a hardy winter wheat?"

It is early, not bearded, very stiff straw. With me it has escaped the midge and rust. Last year it was badly killed by the winter, but not more so than other varieties of white wheat. Mediterranean and other red wheats suffered less; so much so that many of our farmers did not sow white wheat last fall, but have gone back to the Mediterranean. The truth of the matter is just this. If your land is not dry enough or rich enough to produce twenty bushels of Mediterranean wheat per acre in a favorable season, it is useless to sow Diehl or any other choice white variety. But if your land is too rich for Mediterranean, and is dry and otherwise in good order, try the Diehl. You will be likely to get a larger yield per acre and a higher price per bushel.

A farmer in Ohio writes: "I have just sold twenty-nine black-walnut trees to a man in New York for \$600. My neighbors think it will hurt the sale of my farm. I look at it in a different light. That six hundred dollars will enable me to add many conveniences and some necessities. Such timber is too expensive to split into rails. Fully two thirds of the rails on the farm are black-walnut."

When a man does not wish to sell, what is the use of this constant talk about this or that thing helping or hindering the sale of the farm? If the black-walnut trees have got their growth, sell them and spend the money in making such improvements as will add to your own comfort and to the real value of the farm. To split up black-walnut trees into rails is about as sensible as it is to feed out clover seed to sheep or to plow it under for manure.

This same correspondent says he has "half an acre of mallows, or what the boys call cheeses. I cut it up six times last summer, and in the fall had a splendid crop. Will salt kill it?"

I think not. It is a wretched weed. I have been fighting it for years. It does not seem to fear the hoe. It must be pulled up by the root—which is easier said than done. During last winter we had such mild weather that the land could be plowed, and I struck the plow into a patch of land full of this weed and turned up

the roots. All I can say at present is that they do not seem to like this treatment.

The next letter is from a farmer in Pennsylvania, who asks if it is better to fatten grade Cotswold lambs the first winter, or summer them over.

It depends on circumstances. Unless they are remarkably good lambs, and with more than one cross of Cotswold blood in them, I am inclined to think it will be better to keep them over. You get the wool, and it is not necessary to feed so much grain. They will make capital sheep the next winter or spring. When lambs are to be fattened the first winter it is necessary to have them come early, and to push them along rapidly through the summer and autumn; they ought to have some roots in winter.

"Is the Thomas harrow," asks "S. R. E.," "as good as claimed in corn working?"

It certainly kills a great many seedling weeds, and, so far as my experience goes, it does not pull up the corn to any serious extent. If the land is very hard it will not do much good, and if it is very light and rough it will smother some of the plants. Still, I think it a very useful implement, and one I should not like to dispense with. The only trouble I have had with it is with the couplings breaking or coming loose, and sometimes the harrows ride each other. I think the harrow might be improved in this respect. I ought to say that I have had my harrow some years, and it is very likely that this trouble has since been remedied.

A Butter Factory.

The factory system which has been so successful in the manufacture of cheese is equally adapted to the manufacture of butter. The creameries, as the butter factories are called, have made an excellent reputation in the butter markets, and "creamery pails" bring the highest current rates. Concentrated effort and capital are brought to bear in producing butter with the most complete economy and of the greatest possible excellence. The appliances necessary are in no way different from those belonging to any private dairy, except in capacity. The building needed is only an enlarged dairy house, and the principles upon which it is constructed are those upon which any dairy depends for its success. Still, as experience has been gained, there is found to be a style of building which is best suited for the purpose, and internal arrangements which are the most economical and convenient. Such a building is shown in the engravings. Fig. 2 gives the elevation of a successful factory in central New York. The building is 60 feet long, 30 feet wide, and 18 feet to the eaves. The basement or cellar is only partly below the surface of the ground, and is built of stone with hollow walls; the floor is paved with flagstone laid in cement. This secures a perfectly dry, cool, sweet cellar, with an equable temperature throughout the year. The building above the basement is of frame, boarded outside and lathed and plastered within. There is a covered drive-way at one end for delivering the milk, and a covered porch in the front with steps leading to the front door, and below the porch is the basement door. The floor of the factory consists of a milk-room 30 × 36, a work-room 22 × 14, a churning-room 8 × 14, with an engine-room attached. The plan is shown at

fig. 1. The milk-room contains twelve large pans each 10 ft. 10 in. long by 4 ft. 3 in. wide and 7 in. deep. They are what is known as the Jewett pan, which is made with a double bottom with a half-inch water space divided into

Fig. 1.—PLAN OF BUTTER FACTORY.

channels open and closed at alternate ends, so that the water which passes underneath the milk for the purpose of cooling it runs in a suddenly reversed current back and forth until it is discharged at the end opposite to that at which it enters. The entrance and discharge pipes are both raised above the level of the false bottom upon which the milk rests, so that the water space is always completely filled.

Fig. 2.—ELEVATION OF FACTORY.

The pan is a complete structure having no loose parts, and rests upon a wooden table. Figure 3 shows the form and arrangement of these pans. There are several other styles of pans in use in other factories, and some fac-

Fig. 3.—JEWETT MILK PANS.

ories practice the deep-can system, which has been frequently described in our columns. In the engraving (fig. 3) the pipe is shown at *a* by which the water is brought into the pans. It is brought from a spring near by at a temperature of 48°, and cools the milk to a temperature of 60° in the course of four hours. The milk-room is warmed to the same temperature in winter by means of steam pipes which pass through it. At *b* is seen the pipe which carries off the overflow of water from the pans, and which passes down by one of the legs of the table. A por-

tion of the floor is removed to show this pipe. These pans shown at *A A*, fig. 1, are placed 20 inches apart upon each side of the room. A rail track is laid in the center of the room between the pans, upon which a hand-car is

run, which carries the milk from the receiving door. The milk is received into a weighing can, the can rests upon the car, which is higher than the pans, and the milk is run from the can directly into the pans. At *B* is the boiler and engine. The Anderson boiler is the one used and is eight-horse power. At *C* is the churning-room, in which common upright dash churns,

D, D, are worked by steam power. The sink, 12 feet by 3 feet, is seen at *E*. At *F* is the sour milk tank, and at *G* is the work-room. The milk pans, *A, A*, contain 200 gallons each, or the milk of 100 cows at one milking; milk is received at this factory from 300 cows. The twelve pans and fixtures cost about \$700, and the whole building with all the apparatus complete cost nearly \$4,000. The upper story is used for the dwelling apartments of the super-

tendent, and the whole building is neatly painted outside and whitewashed inside. The perfect cleanliness and order usual in the best private dairies are to be provided for in any factory building, and such a location must be chosen as will secure purity of atmosphere, good drainage, and a central position amongst its patrons. The cost of making butter at

this factory is three cents a pound, and twenty-eight pounds of milk upon the average are required for each pound of butter.

The ground plan of a private dairy of 75 cows, owned by Mr. P. D. Merriam, of West Port, N. Y., is shown in fig. 4. The milk-room, *A*, is 30 x 18 feet; *B* is the ice-water tank which supplies the pans, *C, C, C, C*, of the Jewett pattern, with cold water. These pans are 11 feet long by 3½ in width. *D* is the churning room, 15 x 8 feet; *E*, the sour-milk room, is 8 x 5; *F* is the sour-milk tank; at *G* is the wash-room, 12 x 8, which contains a stove and scales; at *H* is the butter and cream room, 2 x 12; and at *I* the ice-house, 10 x 12. Mr. Merriam makes choice butter for the Boston market, and speaks very favorably of the large pans, for convenience, saving of labor, and larger yield of butter than in the small pans. He states that the saving of labor is one half, and the butter made with these pans is superior both in quality and quantity.

The Grubber.

Since the introduction of steam power in the cultivation of land a new system of plowing has come into use. The idea that when the term plowing is used the inverting of the soil as by the ordinary plow is meant, is no longer correct. A very large proportion of the steam

plowing done in England and other countries at this time does not invert the soil at all, but merely pulverizes it. This operation is performed by what are known as grubbers. These implements, drawn by horses, have been in use

Fig. 4.—PLAN OF MR. MERRIAM'S DAIRY.

for many years as aids to the plow in breaking up the subsoil and mellowing the surface soil, but have only recently been substituted for the common plow altogether. Now that it has been found that very satisfactory crops may be

Fig. 1.—THE GRUBBER.

raised by the use of these implements upon stubbles or fallows, when operated by steam, they are coming into use in place of plows drawn by horses. No root crop is sown until the ground has been thoroughly worked with these implements. They are also coming into use in this country. One farmer of our acquaintance uses one to follow the plow, and breaks up the subsoil to a depth of twelve inches. His farm has a very light soil. Another uses one in preparing his land for potatoes and also in cultivating between the rows as soon as the plants appear above the ground.

There are many other opportunities of making these implements useful. Fall-plowed land could be worked with one of them in the spring, instead of cross plowing, with great advantage and economy. They would entirely obviate the necessity for subsoil plows, as they would do the same work much more rapidly. They would

Fig. 2.—TOOTH.

prepare a corn stubble for a fall wheat crop much better than is now done by the surface harrowing common throughout the Western States, and would undoubtedly tend to increase the yield. As a cultivator to break up between the rows of corn or potatoes they

would do the work in half the time of the plow. The annexed engravings show the forms of the teeth generally used and the smallest-sized grubber. Fig. 3 is a tooth intended to fit upon

Fig. 3.—TOOTH.

the bars of the frame by means of a key which passes through the bar, and to carry a winged share which penetrates and lifts and loosens the subsoil. Fig. 2 is a tooth which is clamped upon the frame by means of bolts, and simply stirs the soil. Fig. 1 shows the frame, which is similar to that of an ordinary cultivator, and to which either of the above forms of teeth may be affixed. We know of no person who makes these implements at the present time, but as the teeth are of wrought iron any fair blacksmith should be able to make them. The frame is made of timber strengthened by bolts. A farmer whom we visited some time ago was using a similar implement, the teeth of which were ordinary picks, and he expressed himself as being very much pleased with its effect, both in preparing for crops and cultivating them.

How to Make Hurdles.

The picture in April of the "lamb creep" formed of hurdles has brought us several

Fig. 1.—MAKING A HURDLE.

inquiries as to the best method of making the hurdles for portable fencing. For this purpose they are very useful, and as they are quickly and cheaply made and last, when taken care of, many years they are very economical. The material is generally such as is of little or no use for any other purpose. Brush from fence rows, swamps, river or creek banks, or the undergrowth of woods

Fig. 2.—A HURDLE SET UP.

is what is wanted. The thicker portion of this is cut into stakes five feet long and trimmed of all branches. A piece of scantling 10 feet long is provided, and holes 18 or 24 inches apart are bored in it. The stakes are set upright in these holes, and while in this position the smaller brush is interwoven between them. Figure 1 shows the method in which this is done. When the hurdle is completed it is set up in the fence in the following manner. The stoutest of the stakes are reserved and pointed at each end. These are driven into the ground at such dis-

tances apart as may be needed, so that the hurdles may be fastened to them. Generally one at each end of the hurdle is sufficient, or another in the middle of each one may be used. The hurdles are then tied to the stakes by withes, cords, or wires. Holes are left in the hurdles at each end for this purpose. Figure 2 shows the method of setting up this fence.

A Lard-Oil Press.

The home manufacture of lard oil is a process that may profitably be carried on under some circumstances. Those who may find it convenient to make their own lubricating or burning oil or manufacture it for sale may make use of the simple contrivance here described by "E. K. G." of Holliston, Mass. It consists of a frame made by fitting two pieces of timber 4 x 6 inches thick from the floor to the roof or ceiling of an apartment at least 10 x 20 feet in size. Holes 1 1/2 inch in diameter are bored through the timbers 15 inches apart, and an iron bolt is made to fit them. A press bed is then made of plank three inches thick, 18 inches wide, and four feet long, with a gutter cut out all around it, which leads to a pipe that passes into a cistern below. The bed is placed in front of the upright pieces. Two other upright timbers 4 x 10 are placed upon the bed three feet apart and framed into it and fastened above. A guide one inch thick and two inches wide is fastened to the inside of each of these uprights, and a follower, shown at *a* in the engraving, is made to fit them. A lever 15 feet long and 4 inches thick, 10 inches wide at one end and 6 inches at the other, is made; and a hook affixed to the small end, on which a box may be hung to receive a burden of stone or other heavy material. The press is then ready for use. The lard is prepared by being packed in a box 10 inches square and 3 inches deep, in which a small sheet of strong cotton cloth has been laid. When the box is packed full of lard the cloth is folded over the top of it. The package of lard is then taken out and laid upon the press bed. More lard is prepared the same way, and the packs are placed in pairs, a piece of board being laid upon each pair. When enough has been prepared, a heavy follower which fits the guides is placed upon it, and a wooden saddle or rocker is put upon the follower, and the lever is then arranged so as to press upon the saddle. Weights are then placed in the box. The oil which is pressed from the lard runs down through the pipe into the tank beneath. As the lard is pressed down the pin at the end of the lever is lowered one or more holes as may be needed. The oil made in such a press in the winter time will be of the best quality.

A LARD-OIL PRESS.

deep, which would hold 105 barrels, or 10 1/2 barrels of water, or 375 gallons for every foot in depth. This quantity of water would supply a moderate number of stock for three months; at least it would give one barrel of

SECTION OF A CISTERN.

water a day for 100 days, even should no considerable shower fall within that time. If a larger supply were needed we would rather build several cisterns than one large one, as being more secure against accident. The most economical cistern, both as to cost and space, is a cylindrical one, that is, a round one with straight sides. In a clay soil such a one may be very safely made, but where the soil is

An Underground Cistern.

A capacious cistern is next in value to a good well, and is better than a failing one. It may be constructed with but little labor, and the expense, as compared with its convenience, is small. If every western farm had a cistern at

coarse, compact gravel, it is better to make it somewhat spreading at the sides, or bell-shaped, and similar to that in the engraving. The situation should be chosen in the most convenient place, as it is easier to lay a pipe to it than to carry water from it. The digging should be smoothly done, or there will be waste of cement in the plastering. When the whole is dug the cement may be prepared. This should be water lime or hydraulic cement. Our native Rosendale cement will answer the purpose very well, but if expense is no object, and the best work is desired, we would finish with a thin coating of imported Portland cement. This costs three times as much as Rosendale cement, being worth about \$5 a barrel, while the other is about \$1.75. The cement should be mixed dry, as evenly as possible, with seven times its bulk of clean, sharp sand. As it is needed it may be mixed with water upon the floor of the cistern, so as to become a soft mortar and be immediately spread. A flat stone large enough to stand upon, or several of them, should be laid in the bottom of the cistern, and bedded in the cement. Then the sides should be plastered at least an inch thick, or somewhat thicker at the bottom, in streaks all round the cistern, going regularly around in a spiral, taking care to make the joints very accurately, and leaving scratches to receive the finishing coat. In this way it is finished to the top. After it is done a light coat, with half as much sand as before, is laid over it and smoothly finished. When this is done a thin coat of pure cement, made as thick as whitewash, is laid on with a brush. A covering of joists and plank is laid over the top, and water may be run in at any time, the sooner the better. If any cracks appear before the water comes in they should be carefully filled with the cement wash by means of the brush. The accompanying engraving shows the shape of the cistern which is best fitted for gravelly soil. In stiff clay the shape is not of great importance. In sandy soil the walls of the cistern must be bricked before cementing.

For domestic use a waste shoe should be provided to be hung upon the lead spout from the roof, for the purpose of carrying off the first run of water, which is very apt to taste badly. After the roof and spouts are washed clean, the shoe may be removed and the water turned into the cistern pipe. It is well also to clean out the gutters occasionally and remove dead leaves and dirt. A filter should be attached to the house cistern, made of a wooden or cemented box, two feet square, into the bottom of which the lead pipe discharges. Layers of coarse gravel, sand and pounded charcoal are placed in the box and covered with a slate or a slab of cement pierced with holes. Upon this slab a layer of coarse gravel is placed. The water passes through all these and is freed from ill tastes and color. The engraving shows the manner of making the filter.

Ear-Marks for Stock.

There are various methods in use for marking and numbering animals so that they may be readily distinguished by the breeder. In a recent number of the London Field we find a system described which has been invented by a German breeder, Von Thaer. It consists in the use of three marks only, which may be so combined as to indicate very clearly any number up to 10,000. These marks are, first, a notch in the side of the ear; second, the tip of the ear cut

squarely off, and third, a hole in the ear. Each mark has an arbitrary value which changes according to its position upon the ear, or either ear, and the sum of the values represents the number of the animal which bears the marks. A notch on the front of the left ear stands for 1, two such notches stand for 2; a back notch on the same ear stands for 3, two such notches stand for six; one notch in the back and one in the front of the left ear stand for 4, and combinations of these notches mark up to 9; a front notch upon the right ear marks 10, and a back or outside notch marks 30; combina-

Fig. 1.—EAR-MARKS FOR ANIMALS.

tions of these notches upon this ear mark up to 90, and with those upon the other ear up to 99; a notch upon the tip of the left ear marks 100, one upon the tip of the right ear 200, and these two together 300; a square cut, off from the tip of the left ear, is 400, and from the right ear marks 500; this last mark with the notch in the tip of the left ear marks 600; the tips cut square from both ears mark 900. Thus we have marks up to 999, and the third comes into use. This is a circular hole which, in the left ear, marks 1,000, and in the right ear marks 3,000. By combining these marks any number up to 10,000 may be represented. We append the following engravings of various marks, with the values represented by them. A simple pair of pincers, provided with the required cutters, is the only tool needed. A register of the stock of course will be kept in which the character of the animals will be recorded opposite their particular number. This system is

Fig. 2.—EAR-MARKS FOR ANIMALS.

well adapted in cases where stock is running at large and is in danger of tearing out the ear marks made by inserting rings or bands bearing letters or numbers. Where stock is carefully kept the Dana ear-marks here shown may be made very useful. Careful breeders find it quite necessary to be able to distinguish each individual of their herds. When a calf in a large herd is removed from its dam to be

Fig. 3.—DANA'S EAR-MARKS.

weaned, its identity becomes lost unless a mark is put into its ear. Upon the western plains the usual brands must give place to these me-

tallic ear marks, at least for horned stock, while those previously described will serve admirably for sheep. The metallic ear marks, stamped with the owner's private brand, will be a readily distinguished mark; upon male animals they may be placed longitudinally in the ear, and upon females they may be placed crosswise, as shown in the accompanying figures.

A Smoothing Drag.

E. W. Greene, North Andover, Mass., sends us a sketch of a smoothing drag which is used extensively in his neighborhood instead of a roller. It is eight feet long, and made of two-inch plank. The bottom is two feet wide on the flat, and a plank twelve inches wide is placed in front at such an angle as will enable the drag to ride over the ground and crush all rough clods without pushing them ahead. The sides are made of 4x4 scantling, beveled at one end to fit the front plank. A chain is fastened to the front by hooks, and when in use the driver rides. In addition to

its use as a clod-crusher, it will be found very convenient in gathering rubbish and roots of

A SMOOTHING DRAG.

grass or other weeds from plowed ground. The accompanying engraving shows the drag ready for use.

Our Supply of Salmon Spawn.

It is only four years ago that we were obliged to send to the government hatching house on Wilmot's Creek, near Newcastle, Canada, for salmon eggs, and get them as a special favor, at \$40 a thousand, gold. So jealous were the Canadian authorities of all intrusion into their territory for salmon spawn, that the hatching works on the Migamichi River were broken up, and we had to purchase at the Wilmot establishment, or go without.

Fortunately there were a few rivers in Maine that yielded salmon, and it was thought possible to get a supply from the Penobscot, where some six or eight thousand were taken annually by fishermen. There had been a successful experiment of taking land locked salmon spawn at Grand Lake Stream in Maine, in the fall of 1870, by catching and pounding the salmon during the fall until they were ready to spawn in November. From this it was inferred that the Salmo Salar might be taken alive from the weirs on the Penobscot during the summer, and kept securely in ponds, until the spawning season. A company was organized of the Fish Commissioners of Maine, Massachusetts, and Connecticut, and the Poquonoc Fish Company, who agreed to meet the expenses of an experiment near Bricksport, Maine, under the direction of Chas. G. Atkins, Esq., one of the Maine Commissioners. The first year about 72,000 eggs were taken, and the price of eggs to the parties was found to be about eighteen dollars a thousand. The second year, an ap-

propriation having been obtained from Congress, Prof. Spencer F. Baird, U. S. Fish Commissioner, took stock in the enterprise, operations were enlarged, and 1,500,000 eggs were secured, at a cost of about five dollars a thousand. This last fall there was a still larger investment in salmon, and about 2,250,000 were secured, at a reduced price per thousand. These eggs will be hatched and distributed mainly in the rivers of New England. Beside these over a million of eggs of the Sacramento salmon were taken by Livingston Stone, Esq., under direction of Prof. Baird. These, we learn, are destined for the Delaware, and Susquehannah, and streams farther south, to which this species is thought to be adapted. The country is to be congratulated upon this early and abundant supply of salmon spawn within our own borders. The main difficulties in the way of stocking our barren rivers with this delicious fish are already overcome and cheap salmon are not far in the future.

Care of Young Chickens.

F. J. Kinney, Worcester, Mass., sends us his method of raising chickens as follows: The eggs are placed beneath the hens in boxes in the bottom of which dry earth is placed six inches deep. In very cold weather a newspaper folded two or three times is placed upon the earth. Then two or three inches of fine chaff is laid in the box, and the eggs are placed upon it. As the chicks are hatched they are removed, and fresh eggs are placed in the nest. Some hens thus hatch 45 chickens each. Five or six hens are set at a time, which bring out eight to eleven chickens each. Fifty of these chicks are put together into a cheese-box which will hold a 50 lbs. cheese. A hole is cut in the box to let them in and out after they are four days old (see fig. 1), and one inch in depth of clean, dry, coarse plastering sand is scattered in each box. The chicks are fed with thin cakes made of sifted corn-meal and sweet skimmed milk and baked hard. The cakes are pounded fine

Fig. 2.—RUN FOR CHICKENS.

in a mortar, and with each pint the hard-boiled yolks of two eggs are mixed. This quantity serves to feed 50 chicks each day for the first two days; the next two days 1½ pint and four yolks are given, and the next two days one quart and six yolks. After this some boiled

meat, wheat screenings, cracked wheat, and corn are given four times a day, in addition to the pounded cakes three times a day, until the chicks are a month old. No soft feed is given. When six weeks old the pullets are separated from the cockerels, and they are each placed 25 to 50 together in separate runs. These are made of dry-goods boxes about four feet long, 2½ feet high, and two feet wide. One side and one end are knocked out from each box, and two are placed together so as to form one open box (shown at figure 2). These are covered with tight roofs of matched boards, and in front of each is placed a fence made of boards sixteen feet long and six inches wide, to which are nailed, one inch apart, common plastering laths cut in two. These runs can easily be moved about, and dry earth, charcoal, feed, or any other thing is easily put into them. Earthen fountains containing two quarts are used, are emptied every night, refilled each morning, and the saucer rinsed out each noon. Holes are cut in the tops of the boxes, so that by removing the roof the chickens may be gathered into a small compass when necessary.

For early chickens a frame may be used (fig. 3). It is made like a hot-bed large enough for three sashes, thirty inches high at the back and fifteen inches at the front. The center only is covered with a sash, the rest of the top

Fig. 1.—CHEESE-BOX FOR CHICKENS.

is covered with a roof of matched boards. The frame is placed at the south side of a tight board fence, and the ground inside is raised four inches with dry clean sand and gravel. Fifty early chickens may be raised in this bed without trouble, and if they are brown Leghorns, and are hatched in March and April, they will bring at eight weeks old 50c. to 75c. a pound for broilers, and the cockerels will weigh two pounds each on the average.

The following is the account for 50 chickens hatched April 27th, 1873, and sold at eight weeks old:

50 chickens, at \$1.25.....	\$62.50
1 bushel screenings.....	\$1.00
2 dozen eggs.....	80
1 bushel meal.....	1.00
60 quarts skimmed milk.....	1 50
½ bushel onions.....	1.50
5 bushels small potatoes.....	2.00
100 lbs. cabbage.....	3.00
1 bushel cracked corn.....	50
6 dozen eggs set.....	2.40
Feed of hens.....	1.00
	—\$14.70
Profit	\$47.80

The manure pays more than the cost of frames and care.

The hens need to be carefully managed. They require green feed, meat, a variety of grain daily, with pure fresh water, sand, crushed shells, and bones, dry ashes or earth to wallow in, and plenty of light and ventilation. Ten hens with one thorough-bred cock may be kept in a room 18 by 6 feet perfectly clean and free from unpleasant smell, and each hen may be made to hatch out 45 chickens. Of the chickens hatched nine out of every ten may be raised by using the plan previously described. The yellow Western corn, cracked, is the best

standard feed. Shorts scalded with the water the meat is boiled in, and fed warm, should be given to the laying hens. Full grown fowls should get two ounces of meat a day, all at once, in the morning, during the cold weather, and in two portions in the summer. Onions

Fig. 3.—FRAME FOR CHICKENS.

are very desirable feed, and every day some should be given along with raw potatoes or turnips pounded fine. Cabbage is excellent but costly. Fowls should be fed thrice a day, and in warm weather fresh water should be given as often.

The following is an account of the expense and receipts of 28 hens with their progeny, including the present value of the chickens raised, during the past year. All the figures are taken from the account book except those relating to the manure, which are estimated:

22 Brown Leghorn and Worcester Co. fowls, at \$5.00.....	\$110.00
6 mixed hens, at \$1.25	7.50
100 bushels grain.....	100.00
2,000 lbs. meat, at 1½c. a lb.....	30.00
3,000 lbs. vegetables, at 1c.....	30.00
Care, at 30c. a day.....	109.50
House rent and incidentals.....	30.00
	—\$417.00
Cr.	
407½ dozen eggs, at 40c.....	\$163.00
Eggs sold to hatch.....	27.50
Chickens sold for poultry.....	98.78
Chickens sold to breed from.....	262.00
100 B. L. hens in yards.....	500.00
18 crowsers, at \$5.00.....	90.00
5 Worcester Co. crowsers.....	25.00
20 Worcester Co. hens.....	100.00
33 mixed hens for sitting, at \$1.25.....	41.25
2 tons manure, at \$60.00.....	120.00
	—\$1,427.53

The Sod House.

The sod house of the prairie or the plains is the counterpart of the log house of the backwoods. Each is the rough-and-ready dwelling made of such material as comes most easily to the hand in a locality where the settler has nothing but his own skill and the native resources of the country to help him. Each is the home of a hardy, industrious, worthy representative of the spirit of adventure and enterprise, who carves a home for himself out of the wilderness. Each frequently shelters beneath its roof a settler who is poor in everything but hope and determination to succeed, but yet in each we have seen a home where an intelligent family has lived for a time in comfort and has enjoyed many of the advantages of what is called civilized life. Books, pictures, and music are sometimes seen in such habitations, occupied by well-educated and intelligent settlers, who for the sake of advancing the interests of their children have chosen to undergo many privations and some temporary hardships. In the interiors of some such houses as the one here pictured, well-filled book-shelves, a musical instrument, newspapers and magazines may be seen, and yet the floor may be of earth and the chimney of sticks plastered with mud. Yet the hopeful anticipations of future prosperity keep the tenants of these rough habitations in cheerful spirits, and each field broken and

planted and each tree started into growth repays all its cost of discomfort. Many of the

If the ground slopes towards the dwelling in any one direction there is danger that some heavy rain may swamp it completely, and if the cabin is a "dug out" the basement will be filled with water. Frequently this danger is not discovered until the misfortune occurs, and then it is too late. In building up the sods the joints should be broken, especially at the corners of the building, or cracks will open as the structure settles. In winter time these cracks will be found inconvenient. As these buildings are only intended to be temporary, the stables and out-houses

general, it is far from wise for a new settler to ignore the fact that his neighbors frequently know more than he does himself, and that it is the part of wisdom to receive advice, and indeed to ask it, especially if the settler is from a foreign country and is unused to the ways and the necessities of his newly-chosen locality.

SOD HOUSE—INTERIOR.

most cheerful and congratulatory letters we receive come from such habitations, and only recently one came from a sod house in Nebraska, written by a lady who cheerfully described the earthen floor of her cabin, and remarked that if she and her young children were to choose, she and they would many times rather keep the earthen floor than miss the *Agriculturist's* monthly visits to them. Doubtless there is sunshine in that cabin whatever there may be outside of it, and the incident helps to recall to us the remembrance of several such homes upon the unbounded prairie from whence we have seen neatly dressed children issue, singing and frolicing on their way to school, or from which we have heard the sounds of music as we rode past. But while all this and sometimes the reverse is often true, there is a practical sense in which the sod house should be considered; for if the floor is wet, and the roof leaks, and the walls are suspiciously unsafe, the most cheerful-minded woman will lose her good-nature and contentment, and the chief support of the household being withdrawn disorder and discomfort reign therein. The choice of situation for the dwelling is the first consideration. This should be a spot from which the ground slopes in every direction. There

should be placed as near to them as may be; and for protection against the few severe storms that may occur in winter, when it may

SOD HOUSE—EXTERIOR.

be unsafe to be at a distance from the house, a shelter of sods or some other material should be made to protect the passage from the house

fixed to an upright shaft, and the movable stone is fixed upon this shaft, making but sixty revolutions per minute. There are no bolts in the mill; the only grain ground is oats, and each farmer who carries his grain thither grinds his own grist, which runs from the stones upon the floor, from which it is swept up and taken home in the bags in which it was brought. If this process is rough and inconvenient, the farming upon these islands is equally rough and surrounded with hardships. Oats are the staple, or rather the only grain which ripens, and sometimes this crop fails to mature, or the season is so unpropitious that it can not be gathered, but remains in the shock far into the next season before it can be dried sufficiently to thrash, or is sometimes totally lost. The herbage is scanty but nutritious, and sustains the very diminutive ponies, which are the only horses upon the islands, a few very small cows, which give three quarts of milk per day during a short season, and very short-wooled sheep, some of which are not much better than goats. The winter lasts six months, and the agricultural operations of the inhabitants are supplemented by fishing, which is rendered hazardous by the frequent storms. We doubt if there is one farmer in our highly favored country whose position would be bettered by changing places with the most prosperous Shetlander.

A SHETLAND GRIST-MILL.

should be no hollows near, for in the spring and early summer these hollows often become lakes of water, and every level spot is saturated.

to each out-building. Such a convenience might have saved life during the winter of 1872-'73 which was lost for want of it. In

An Enormous Arad — *Amorphophallus*.

The recent taste for "subtropical" gardening, in which regard is had to grace of form in plants or striking character of foliage, rather than beauty of flowers, has led to the introduction of numerous curious subjects, among which is *Amorphophallus Rivieri*. As it has not yet received any English name we can not offer any other as an alternative. Two years ago, Messrs. B. K. Bliss & Sons gave us a tuber about the size of one's fist as a great novelty just received from France. This tuber threw up a single leaf-stalk about two feet high, which at the top was surmounted by a large umbrella-like leaf cut into three principal divisions, which are themselves curiously and irregularly subdivided. An idea of the form of the leaf can be obtained from the engraving, though a portion of it is concealed by the flower. The tuber produces but one leaf each season, but this is a monster. Mr. Bliss informed us that he saw them in France, from strong tubers, four or five feet high, with the blade four feet across. Growing by itself upon the lawn, its unusual and somewhat grotesque appearance is sure to attract attention. The leaf stalk is of a greenish black color, with numerous lighter spots, while the leaf itself is of a dark green. Our tuber when taken up in the fall had increased considerably in size and thrown off a great number of offsets, by means of which it may be rapidly propagated. This spring Messrs. Olm Brothers, florists, of Newark, N. J., had a large tuber flower in one of their greenhouses; they sent it to us, and we have had an engraving made from it. The huge flower was, including stem, about three feet high; the flower stem arises from the tuber unaccompanied by leaves, and, as well as the flowering portion, is of a peculiarly lurid greenish purple color and spotted; the spathe or expanded portion is irregular in outline and somewhat ruffled on the margin; the interior surface has a somewhat metallic luster. The projecting central portion, the spadix, is flattened sidewise and roughened with small tubercles. It is at the base of this spadix that the flowers are borne; the large showy spathe being only a protecting covering and not the flower itself. The flowers are of the simplest structure, consisting for the male flower of a single anther and in the fertile flower of a single pistil, each without anything like calyx or corolla. The pistillate flowers are crowded together in a band around the base of the spadix, with the staminate ones in another band directly above them. The engraving will at once bring to mind the common Calla Lily, and the flower looks like an enormous lurid purple Calla without leaves, but still more like some of the exotic Arums. We ought not to take leave of this remarkable flower without saying something of its odor—to describe it is hardly possible. The eccentric Dr. De Wolf said that a dead dog was a true aristocrat, as he kept common people at a distance; so this must be among the most aristocratic of flowers, as but few would venture upon familiarities with it. Dr. Wight says of an Indian species, *A. campanulatum*, that its odor was such "as to induce flies to cover the club of the spadix with their eggs." The flies may be pardoned for their mistake if the odor of that species was like that of this. It is not a desirable plant for house culture, but a most

striking one upon the lawn, and as the flowers appear before the leaves they can be cut away before they open. As the tubers multiply rapidly, and are kept with no more care than is required by the Dahlia, we think it will

AMORPHOPHALLUS RIVIERI.

become popular with those who like odd things. The plant was first brought into notice by M. Riviere, director of a garden near Algiers, who found a minute tuber accidentally mixed with some seeds sent from Cochinchina, and to whom the species was dedicated. The generic name, *Amorphophallus*, might be translated, an unshapely club, probably because the club-like spadix is flattened and irregular in form.

The Preservation of Celery.

BY PETER HENDERSON.

Spring is hardly the proper season in which to describe an operation that can only be done on the approach of winter, but I am convinced that many of your readers would cultivate celery, were they sure that they could easily pre-

serve it during the winter. Market gardeners, who store away large quantities, preserve it in narrow trenches in the open ground, and protect it by means of a covering of leaves or litter, as already described in your pages and in "Gardening for Profit"; but for smaller growers, either for sale or for private use, quite a quantity may be preserved in any cellar where there is no furnace or other fire heat. When a few hundred roots only are to be stored, it can be placed in narrow boxes, say nine inches wide, four or six feet in length, and of a depth a little less than the height of the celery. A few inches of sand or soil is placed on the bottom, and the celery is packed in the box up-

right, the roots being placed on the sand at the bottom; the celery must be packed in as tight as possible, but without bruising. Boxes thus packed and stood on the cool floor of the cellar,

if put away in November, will be "blanched" fit for use during January, February, and March. If put in sooner than November, it will blanch earlier, and if stored later it will keep later. If larger quantities are to be kept in the cellar, the cheapest practicable way to do so is to begin at one side next the wall, farthest from the entrance, and erect boards across the cellar, nine inches from the wall, and of a height a little less than the length of the celery—that is, if the celery is twenty-four inches in length, the boarding may be eighteen or twenty inches high. In this narrow division the celery is packed in upright, as above described for packing in boxes. As soon as the first tier is filled, erect another board trench or division at nine inches distant from the first, and so on until the whole space required is filled up. It will be understood that no soil or sand is packed between the stalks of celery, only two or three inches being strewn on the floor, on which the roots are placed. A cellar or root-house so packed; 20 x 20 feet, will hold from 3,000 to 5,000 roots of celery, according to their size. Care must be taken not to get the board partitions forming the trenches, or divisions between the tiers of celery more than nine or ten inches apart, for if at much greater distance, the stems and leaves would be in too large masses and would generate heat and soon decay.

As the cellar or root-house is usually a damp and dark apartment, there will generally be no necessity to water the celery after it is packed. Every means of ventilation should be used, even in cold weather, for it must always be borne in mind that celery is a vegetable that will stand quite a severe frost without injury, so if the temperature of the cellar falls five or six degrees below the freezing point, no injury will be done. When celery or other vegetables are packed away for preservation in cellars or in the open field, it is indispensable that no water be allowed to lodge in the pit or trench; so that in the event of using a cellar or root-house for this purpose, a matter of first importance is to provide for thorough drainage, in soils where drainage is at all necessary.

THE WEEPING POPLAR is now being written up abroad, and this will probably convince our planters what we have for years insisted upon, that it is one of the most valuable of lawn trees. It should be grafted eight feet high.

THE PEA-WEEVIL.—We do not know if seed peas are unusually "buggy" or not this year, but we have had an unusual number of letters about the "pea-bug," as the insect is incorrectly called. One writer is afraid to plant some "buggy" peas for fear of introducing troublesome insects into his garden. So far as we are informed, the pea-weevil attacks the pea only. The mother weevil lays her eggs upon the outside of the young pod; she does not "sting" the peas, as many suppose. When the larva hatches out it eats its way to the inside of the pod and young pea, where it feeds on the (marrow) fat of the land, and, unless it is first eaten itself by pea-lovers, it forms a chrysalis within the shell of the pea, and in spring comes out as a small black beetle ready to continue the work. It is a general impression that because the germ is not injured "buggy" peas are just as good as any other for seed. This is a mistake, although the seed will germinate; the plants, being deprived of their proper nutriment when young, the weevil having devoured it, are never so vigorous and productive as those from sound peas. Our seedsmen have their seed peas grown in localities where the insect has not yet been introduced or where cultivators take pains to destroy it. Peas germinate when several years old, and if all in a neighborhood would agree to plant no infested seed for a year the insect would disappear. White says that putting the peas in a tightly corked bottle with a tea-spoonful of spirits of turpentine will kill the insects without hurting the peas. Others have successfully used chloroform in the same manner. If the peas are put into water the unsound ones will float. In raising peas for seed the insect can be avoided by planting in June, after it has ceased to operate, though in most localities late-planted peas do not succeed very well.

Notes from the Pines.

FORCED PLANTS.—Any plant made to grow and flower at other than its natural season is properly a forced one. When we bring Hyacinths and other spring-flowering bulbs into bloom in January, they are forced, though that is done so frequently and even in an ordinary window that we do not look upon it as forcing. There are many plants that we enjoy in the open border in spring that we can have in flower in the winter, if we take a little forethought, and get up the plants and pot them in the fall. I think I mentioned last year what gratifying success I had that winter in forcing *Astilbe* (or *Spiræa*, as some will call it) *Japonica* in my study windows. Bleeding Heart (*Dicentra*) is another excellent subject for forcing; it will do well in a warm window, and nothing can be finer. In forcing such plants as these the

ESSENTIAL THING TO OBSERVE is to give the plants a complete rest before we begin to start them. In the open border they are kept perfectly dormant by the low temperature, and when we pot them in the fall they should be kept in a cool place. The cellar is often so warm that they are excited into growth too soon, and this must be prevented by keeping them as dry as may be without injury. If kept wet in a warmish cellar, they will make a slow growth and fail of that absolute rest which seems to be necessary. Last fall the ground had begun to freeze before I had lifted all my plants, and some were grubbed up with a cake

of frozen earth adhering to them. These were put under the greenhouse bench to thaw out, so that they could be potted. Some weeks after, in overhauling the things stored under the benches, I came across some roots without a label, which on examination proved to be the Bleeding Hearts which were taken up to be forced but had been overlooked when the rest of the things were potted. They were so dry as to be apparently beyond all hope of recovery, and I was about to throw them out, but finally concluded to see what they would do, and potted them. I never saw the *Dicentra* finer than came from these roots, which had been so thoroughly rested that I supposed them to be past awakening.

A GREENHOUSE PUMP.—Early in the winter I got tired of the primitive way of dipping water from the cistern under the greenhouse floor and looked about for a pump. By good luck my eye caught the advertisement of the People's Pump, sold by W. S. Blunt, No. 77 Beekman street. An inspection of the pumps gave a favorable impression, and one was ordered and put in. It stands under the bench of the greenhouse, quite out of the way; the handle in use projects into the path, but at other times it is fastened up against the edge of the bench by a button, and is hardly noticeable. It can be transformed from a lifting into a forcing pump in "a jiffy," and as either it is perfectly satisfactory. The compactness of the affair and the ease with which it works are so satisfactory that it is almost worth while to build a greenhouse just for the fun of having a People's Pump.

It is not altogether satisfactory to write at the end of March notes to be read in May. Spring work has hardly begun, and in May one will not care to think about in-door plants. With so large and miscellaneous a collection as I have, it is a matter of interest, after cold weather is fairly over, to go about and see how things have passed the winter. It is a succession of surprises. Many plants that one would expect to find hardy are found dead, and others that were left to be killed by the winter will be found to survive. It is a great pity that we have nothing in this country to correspond to the French garden of *Acclimatation*. There is no direction in which experiments can be more usefully made than in testing the hardiness of different plants. It is true that the nativity of a plant is some guide, but by no means a certain one, as some of our persistent weeds are from tropical countries. We now and then find out by accident that a plant heretofore thought to belong only to the greenhouse is really hardy. Few persons can afford to experiment largely in this matter, and there should be some public garden where it could be done.

PRIMULA JAPONICA.—At last I have flowered this much talked of and high priced novelty. Year before last Mr. Hogg gave me a plant of the "simon pure" right from Japan, but it daily grew smaller. Last fall he gave me another, which was left out in a frame until January, and Mr. Chitty of Bellevue Nursery, Paterson, N. J., sent me this spring two more that had been similarly treated. One of these plants was put in the coolest part of the greenhouse and the other two in a window of my study, and all three came on finely. Many have complained of failure with this plant, but it has been due to too tender treatment. It is, no doubt, perfectly hardy—though no one that I have heard of has risked his \$3 or \$5 plants to establish the fact—and should be treated like

any other hardy perennial. If wanted in bloom in the house, then it should have the same treatment as other hardy plants that are forced. The plant is a beautiful one, but mine do not bear out the extravagant encomiums of the English horticultural journals or the highly colored plates of the foreign catalogues. It is handsome and showy, but has not afforded me so much pleasure as another Primrose.

PRIMULA INVOLUCRATA, about which no one has exhausted all the adjectives and exclamation points. A plant of this modest species came from Mr. George Such, at South Amboy. The leaves are of a peculiar silvery whiteness, and the plant would be a handsome one if it did not flower. It throws up a cluster of long tubular, delicate yellow flowers of the fragrance of a spring morning.

PLANTING TIMBER.—It will be but a very few years before timber becomes very much enhanced in value. Ten years more will see the supply in the north-west greatly reduced in quantity. No more profitable use of land can be made than to plant walnut, chestnut, oak, hickory, spruce, ash, maple, poplar, and other trees that have a value in the arts for their timber. It is highly probable that, as pine becomes more costly, it will be used only as joists, rafters, and flooring, and that brick and stone will be more commonly employed as building materials. When this occurs the stock of pine, throughout the country, will be found to last almost indefinitely. The more valuable pine trees grow very slowly and would hardly be profitable to plant.

Crossing—Hybridizing.

There would appear to be just now an unusual interest in the matter of improving plants by crossing or hybridizing, to judge from the letters we have had asking us to describe the process. Crossing and hybridizing are terms often and incorrectly used to express the same thing. Crossing takes place between varieties of the same species, while hybridizing should only be applied to the operation as applied to plants of different species. The latter are very often infertile and can not be propagated by seed. We are asked for directions to perform the operation, but can only give the most general ones. Whoever would experiment in this matter must have some knowledge of the structure of flowers and be a close observer. The production of a cross or a hybrid is effected by fertilizing the pistil of one plant by the pollen of another plant. To understand this simple statement requires a knowledge of flower structure that many have never acquired. In every perfect flower there are two sets of organs engaged in the production of the seed. A magnified flower of the grape (fig. 1) will serve to illustrate. The bottle-shaped central body, *b*, is the pistil which contains some minute greenish pulpy bodies which may become seeds, but which will never mature into seeds unless they receive some influence from without; in other words, they must be *fertilized*. Here in the grape there is an abundant provision for fertilizing the pistil in the bodies which surround it, one of which is marked *a*. These are the stamens, each of which consists of a two lobed pouch upon a stalk. This pouch is the anther and the stalk the filament. When the flower is fully developed, each half of the pouch or anther cracks open by a slit and lets

out a fine yellow dust, the pollen. Unless this pollen, or that of some other grape, falls upon the proper part of the pistil, which in this case is the flattened disk at the top, it will produce no seeds. It is not necessary here to state what is known of the way in which fertilization takes place. Practically there must be a pistil to be fertilized and pollen to fertilize it. In the grape these are both provided in the same flower; in Indian corn, the squash, and all of that family, one set of flowers has the pistils and another set the stamens which furnish the pollen. In the hop, spinach, and others, the pistil bearing and pollen producing flowers are on different plants. The grape was taken as an illustration, and let us continue with that. In the ordinary course of things the pollen will fall upon the stigma and fertilize it, or if the pollen of this flower is not quite ready to be scattered and the pistil is ready to receive it, the pollen from another flower close by may fall upon the pistil and complete the work. Now to cross this grape, which we will assume to be the Clinton, with another, we will say the Black Hamburg, we have to attend to three things: We must prevent this flower

Fig. 1.—GRAPE.

from being fertilized by its own pollen; we must bring to it the pollen of the Black Hamburg and, after applying this, prevent any pollen from another Clinton flower being brought by winds or insects to this pistil. The petals of a grape flower fall off as a little cap; when this is about to fall off it is removed, and all the stamens, before they have shed their pollen, are cut away. Some are so expert as to be able to pinch them off. This prevents the flower from fertilizing itself, and is done early in the morning. In practice several flowers on a bunch are prepared and all the rest cut off. The pollen of the Black Hamburg must be at hand. This is collected from the flowers of that variety by holding a sheet of paper under the flower clusters and shaking them. When the day is warm and the air dry, pollen in great abundance is shed by the anthers. The pollen when collected is carefully preserved in a small bottle or, if not to be kept long, in a paper. Grape pollen will keep in good condition for some weeks, and that of other plants

Fig. 2.—POTATO.

has been known to preserve its vitality for months. The maturity of the pistil is known in the grape by the moist appearance of the stigma, as that portion which receives the pollen is called; and by means of a camel's hair brush some of the foreign pollen is placed upon the stigma, and then the flowers that have been thus operated upon are inclosed in a muslin bag to prevent insects from bringing other pollen to them, as this might interfere with the action of that already applied. This is the briefest outline of the manner of crossing or hybridizing the grape. If a novice wishes to try the process upon some other plant, the first difficulty he will meet with is that the flower is quite different in appearance from

the grape, and he is at loss to discover the parts that appeared so plain in the grape flower. All flowers are constructed upon the same plan, but the variations in carrying out the details are truly wonderful, and unless one knows the variations of which all the parts are susceptible he will be puzzled. Compare the potato flower, fig. 2, with the grape flower.

Fig. 3.—LILAC.

In the grape the stamens are longer than the pistil, and stand out from it, and the filaments are long in comparison with the anthers. In the potato the stamens are shorter than the pistil, and are crowded close to it; the anthers, which in the grape were small, are here longer than the filaments, and instead of opening by a slit to let out the pollen it makes its escape through little holes in their tops. Here are all the parts that are in the grape flower, but wonderfully modified. Another variation is all we can show. Fig. 3 is a lilac flower cut open. Here the novice will be puzzled to find two stamens only, and these stuck fast to the tube of the corolla. A mere outline of the matter can only be given here, but enough has been said to show that whoever would undertake artificial fertilization must give some thought to the matter. The whole subject of natural fertilization is full of interest and abounds in curious facts, and is worthy the study of any intelligent person, even if he does not wish to make any practical use of the insight he may gain of the workings of nature. It may be mentioned here that a French florist, whose name we have forgotten, has recently found it to be a great aid in his fertilizing operations to touch the stigma of the pistil with honey, and that by thus doing his success is much more uniform than before. It is probable that the honey serves to retain the pollen until the stigma is ready to receive its influence.

The Vanilla Plant.

BY H. G. LUNGREN, M.D.

[By Vanilla plant we do not refer to the plant which furnishes vanilla, but to a native species, *Liatris odoratissima*, which, on account of a similarity of odor, has received that name. Most of the species of *Liatris* or Button-snakeroot, have a tuber-like root, and long straight stems upon which the numerous flower-heads are crowded in a close spike. A number of these are cultivated as ornamental plants, and we figured several of them a few years ago. In *L. odoratissima*, the root-leaves are from 8 to 12 inches long by 2 or 3 broad; those of the stem very small. The stem divides above into a broad branching panicle of purple flowers, which make the plant an attractive one. Our correspondent, Doctor H. G. Lungren, of Volusia Co., Fla., has at our request given us the following account of the plant.—Ed.]

The Wild Vanilla, or, as it is commonly called, "Heard's Tongue," or "Deer Tongue," grows abundantly on the edges of what are called "Bays," *i. e.*, low mucky places in the pine woods, which are partially covered with water and grown over with bays (a species of *Magnolia*), or on low swampy pine woods in

East and South Florida and in portions of lower Georgia. The fresh leaf has, when crushed, a greenish, disagreeable odor, but when pulled from the plant and dried in the shade for a day or so, it becomes highly fragrant, having a smell resembling vanilla or Tonka-bean, and similar to the sweet-scented vernal grass, but much stronger. This odor is developed by some chemical change made in the leaf during the process of drying, whereby a peculiar principle known as Coumarine is formed. Coumarine is found abundantly in the Tonka-bean of commerce, but so abundant is it in the *Liatris*, that it is often found in large quantities on the upper portions of a mass of the semi-dried leaves. It is readily sublimed by a low degree of heat (150°), and the heat generated in these masses or bundles is sufficient to sublime it on the upper or cooler layer. When found in this way, Coumarine is composed of snow-white, needle-shaped crystals, exceedingly fragrant—a leaf of the *Liatris* often being covered on its under side, and looking as though it had been out all night in cold, frosty weather.

The dried leaves furnish an article of commerce, and one that is steadily growing in importance. It is gathered all through East and South Florida, principally on the St. John's river and its tributaries, by the poorer people, and sold by them in small lots to the country store-keeper in exchange for goods; by these store-keepers it is sent to the balers and packers, by whom it is sent to New York for home use and exportation. Pilatka, on the St. John's river, is the head-quarters in this trade. One may often see seventy-five or one hundred bales, of 200 lbs. each, lying on the wharves, awaiting shipment—once dealer at this place having an order to fill of 150,000 lbs. Adults can gather from 150 to 400 lbs. of the green leaves in a day; active boys and girls nearly as much. The green leaves are taken home and dried in the shade, and lose about 80 or 85 per cent; they are, when dried, sold at the country stores for from 3 to 6 cents per lb., yielding quite a good return for the labor. The packer bales and ships, and realizes from 8 to 12½ cts. per lb. The dried leaves are used to give a flavor to segars, snuff, and smoking tobacco. For segars, it is sufficient to place the leaves and segars in alternate layers in a box, and allow the whole to remain together for several days; for snuff, the leaves are dried, ground, and mixed; it is granulated or shredded up and mixed with smoking tobacco. A small quantity is sufficient to flavor a large mass of tobacco. The odor is given off much more intensely on a damp day than on a dry one. Although large quantities of these leaves are consumed in our home factories, a much larger quantity is shipped to Germany and France direct, where it is rapidly growing in favor. It is quite probable that it will soon be an article used extensively in perfumery; and as it is known to keep "the wicked moth away," it will be in great demand for that purpose in the stead of the strong-smelling camphor and tobacco stems.

The Pale Corydalis.

As we were, a few years ago, inspecting the grounds of a well-known amateur cultivator of flowers, he said: "Come and see a new *Dicentra* that I have just flowered." We went, and found the Pale Corydalis, *Corydalis glauca*, which we had never before seen in cultivation

except in our own grounds. Among the many wild flowers that we have introduced into the garden none have given us more pleasure than this. It is a biennial, which ripens its seeds

Fumitory Family (*Fumariaceæ*), and its name is the ancient Greek one for Fumitory. The beautiful Alleghany-vine, *Adlumia*, and the native and cultivated Dicentras (Bleeding-

Georgia by the late Mr. Durand, without suspecting it was not a wild plant. He sent the plant to Torrey and Gray, who supposed it to be a new species of Cinquefoil or *Potentilla*, and

PALE CORYDALIS.—(*Corydalis glauca*.)

VANILLA PLANT.—(*Liatris odoratissima*.)—See page 183.

and drops them early, and the young plants from them acquire sufficient size the same season to flower next year. In the wild state it is more common in rocky places than elsewhere, and is often not more than six inches high, but in the more favorable soil of the garden it is two feet or more. The plant in its first season from the seed is not without beauty, as it presents a tuft of finely-divided leaves which are of a remarkably pale, glaucous green color. In May it shoots up a leafy flower stem which bears at the top a panicle of purplish, yellow-tipped flowers, which, while not very showy, are exceedingly neat and pleasing. In the garden the plant continues to flower nearly all summer. The flowers resemble those of the well-known *Dicentra*, except that instead of having two spurs to the corolla this has but one. This species is rather common, and is found as far south as the mountains of North Carolina; a pale yellow species, *C. flavula*, and a golden yellow one, *C. aurea*, are less common. Several exotic species are perennials, the finest of which, *C. nobilis*, is sometimes, though rarely, seen in our gardens. The *Corydalis* belongs to the

Heart, Dutchman's Breeches, and Squirrel Corn) also belong to the same botanical family.

The Indian Strawberry.

It is a little strange that a plant, at first known only from Nepaul, should have become

named it in their Flora of N. A., *P. Durandii*. As these botanists had the plant without fruit, this mistake is not to be wondered at, as this *Fragaria* differs from all other strawberries in having yellow flowers, which is the color of the flowers in most *Potentillas*; the main differences between the two being found in the fruit. The Indian strawberry, which is a much smaller plant than either of our native ones, unlike them produces leaves along its runners; its manner of flowering is different from that of other strawberries in producing a single flower stalk in the axil of a leaf which bears but a solitary flower. The calyx proper has acute sepals, and immediately beneath these are toothed leafy bractlets; petals bright yellow. The fruit, which is small, has the appearance of an ordinary strawberry, but is odorless and insipid. In Europe it is valued as a plant for growing upon rock-work; it is also fine for a hanging basket, being an almost perpetual bloomer. A piece of our garden plant was taken into the house, and has produced its cheerful yellow flowers and bright but deceptive scarlet strawberries all winter.

INDIAN STRAWBERRY.—(*Fragaria Indica*.)

naturalized in this country and make itself at home with all the appearance of belonging here. This the Indian Strawberry, *Fragaria Indica*, has done. It is sparingly found near Philadelphia and more plentifully farther south. Many years ago it was collected in

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

About Paper-Hangings.

It has no doubt puzzled many housekeepers that wall-paper should be called paper-hangings, and

there had to be as many blocks as there were to be colors in the figure, each color being applied separately, and the paper dried after each impression. For the finest French papers block printing is still in use, and at one establishment celebrated for its papers, which are said to equal fine paintings, as many as 3,000 blocks are required for one pattern. The invention of the paper machine, which pro-

it body. The first operation, as in block printing, is to apply the ground color, which, like all other steps of the process, is done by a machine (fig. 1); here one side of the paper which is in large rolls of 60 to 100 pounds comes in contact with the body color, and is passed into the drying-room (fig. 2), where it hangs over poles in a highly heated atmosphere until it is quite dry. It is again

Fig. 1.—"GROUNDING" THE PAPER.

Fig. 3.—"SATINING" THE PAPER.

that a man whose business it is to paste paper upon a wall should be called a paper-hanger. In olden times the rooms of the wealthy had their walls covered with fabric of some kind—silk or velvet and even leather being used, as well as tapestry, which was often most elaborately embroidered and very costly. These were called hangings. Some 200 years or more ago paper to use instead of these fabrics was imported into England from China, and was naturally enough called paper-hangings. Paper for walls had been in use from time immemorial in China, where the designs were put upon the paper with a brush. The early English attempts to imitate the Chinese paper were by stencilling—i. e., rubbing on the colors through patterns cut out of pasteboard. This rude method soon gave way to stamping the figures upon the paper by means of wooden blocks upon which the design was carved. Before the invention of the paper-making machine the paper was all in single sheets, which were first printed and then pasted together. First there was a ground

duces paper in a continuous sheet of any required length, and the application of machinery to the printing, has quite revolutionized the manner of

Fig. 2.—THE DRYING-ROOM.

making all but the most costly kinds of wall-paper. Calicoes were formerly all printed by hand with blocks as described for paper printing, and the invention of the calico-printing machine naturally

rolled up for the next process. If the paper is to be "satinéd," as those which have a smooth, polished surface are called, it is passed through a machine (fig. 3) where it is subjected to the friction of a rapidly revolving brush, which leaves the surface finely polished. The paper, whether "satinéd" or with a rough ground, has the figure printed on it by means of a machine (fig. 4) very much like those on which calico is printed. The designs are cut upon rolls, which are cylinders, usually of copper, upon which the pattern is engraved. These are so arranged as to take up the color and apply it to the paper as it passes over them. There must, of course, be as many rolls as there are colors to the figure, and the impression made by each must match that made by the preceding one with great nicety. The final operation is to make up the paper from the large roll into smaller ones such as are sold in the stores. This is also done by a machine (fig. 5). When the small roll is of the proper size it is cut off by means of a large knife with an edge like a saw. Those pa-

Fig. 4.—PRINTING THE PAPER.

Fig. 5.—MAKING UP THE ROLLS.

color rubbed evenly over the paper by means of brushes made for the purpose; this was dried, and either printed on directly or the surface polished by rubbing. Then the design was printed on by blocks, first dipped in the color, and then applied by means of pressure or struck a smart blow with a mallet. One block printed but one color, and

led to the use of a similar one for printing paper. One of our artists has recently visited a paper-hanging factory, and made sketches of the operations. The colors used are mixed with a size of glue-water sufficiently strong to make them adhere when dry, and some, especially the ground color of the paper, are thickened with very fine clay to give

pers that present a rich, velvety surface have this effect produced by what is called flock—this is wool, usually the shearings from woolen-cloth factories, dyed of different colors, ground in a mill, and sifted. The portion of the paper to which the flock is to be applied is first covered with an adhesive size and the flock sifted over it. Frequently

papers have gold introduced in the pattern. The places to be gilded are printed with size, and gold-leaf imitation metal leaf is applied by hand.

Closets in the House.

Having suffered some for closet room at one time and another, or for places to stow away things, I have had considerable sympathy with that man who said that when he built a house he should begin with a big closet and make additions to that. When I speak of closets my husband understands me, but immediately begins to talk about modes of ventilating closets, and I have only gradually grown to understand his strong sense of the necessity for closet ventilation. Having for several years hung the clothing of the family in rooms where there was a free circulation of air, I am surprised when I go into the well-finished clothes-rooms (let us call them *close* rooms) in some fine houses to find how dead and unwholesome—not to say foul—the air is. The soiled garments hung in a tight and dark room, contaminate the whole apartment, and such contamination is very perceptible to a well-trained nose or to olfactories accustomed to the refinement of habitual pure air. Old boots and shoes cause a bad smell in a close room.

To pursue an unpleasant subject a little farther—why *will* people keep the dirty clothes designed for the weekly wash in a close closet? That which has come from the skins of unclean or unhealthy persons (the latter adjective describes nine tenths of the human family) grows constantly more impure shut away from light and air, and everything kept in the same room is contaminated by the effluvia. Can not soiled garments be kept while waiting for the wash, in some bag or covered basket in the wood-shed or some such place? There are baskets on purpose for soiled clothing, open enough for ventilation but too fine to admit mice.

Unless a closet is ventilated so that there is some circulation of air through it, it is no place to hang away night-gowns, unless they have previously been aired, so that the perspiration accumulated in the previous night—only insensible perspiration, perhaps—has been dried and sunned away.

I have no means of ascertaining this morning how far science has attended to this subject of closet ventilation, but I am very sure that it is an important matter, and should be well looked into. Of course, there can be closets with windows in them, and this should generally be the case. They can be kept dark, as a general rule, if desired, but it ought to be possible to admit a flood of light.

Closets built under stairways might be ventilated by a grate closed by a sliding shutter under one of the stairs. It would be well to have the grate capable of being shut to keep out dust when the stairs are swept. I do not know whether this has been tried, but the idea has occurred to me as practicable. A sliding window in the closet door is also possible. The small sliding window in the door and the grate in the elevation of one of the stairs ought to give a sufficient circulation of air to a small stairway closet.

It is idle to suppose that a closet (or any other room) is provided with ventilation because it is built large and high. There must be some circulation of air, or the atmosphere becomes dead.

Home Topics.

BY FAITH ROCHESTER.

TOWNS-PEOPLE'S CRITICISMS ON COUNTRY FARE.—The tide will soon be setting again from city to country. City people are generally ready to pay country people a good price for comfortable lodgings and board during the hot summer months; but they make many complaints of disappointment in respect to the fare which they are obliged to take up with along with rural life among the farmers.

I have had several months of city life lately, but the country seems likely to become my permanent home, and that speedily—whereof I am glad. So I may speak freely of the shortcomings of country

housekeepers and householders, as one who may be included somehow in the general castigation.

A friend writes to me in a private letter: "I do think that there is a deal of missionary work to be done among farmers' wives. I was sometimes vexed with the family where I boarded to see how every drop of cream was converted into butter and heavy lard pie-crust set before us; while cracked wheat, graham meal, and oatmeal were unheard of. I felt like exclaiming that 'good farmer's fare' was the most indigestible in the world. The inevitable *pig* occupies so prominent a place in their household economy that I was tempted to wish that a hog-plague would sweep through the country."

So large a proportion of those who flee from the city during summer are in pursuit of healthier conditions of living that it seems as though it would be the fair and Christian course for us who have any of them to entertain to give some study to the subject of the preservation of health by natural means. First the air. There is plenty of pure, life-giving oxygen out-of-doors, but the air of many country houses is constantly foul and poisonous. I say that which I do know. The windows are opened to ventilate the dwelling, perhaps; but ignorance has done its best in many cases to make a supply of pure air in-doors, even in the breezy summer time, literally impossible until great changes are effected. On one side there is perhaps a big horse barn and cattle shed, with piles of fermenting manure. On another side is a row of foul pig-pens; on another the slops from the kitchen and pantry are thrown out to decay and ferment and send up their fetid gases; under the floor of the dwelling is the unclean cellar perhaps, where very likely there is no such provision for ventilation as allows a fresh breeze to sweep through it, and where, possibly, some of last year's vegetables are going to decay. Then there is perhaps an open, unshaded "out-house," neglected and disgusting. So it seems hardly possible for the dear, good winds of heaven to blow toward the house from any quarter without bringing deadly poison along with them. There is no disagreement among scientific men, including all educated physicians, as to the fact of the poisonous nature of all these foul odors that arise from decaying animal and vegetable matter.

Do you ask what shall be done with refuse matter? Our wise Creator is trying to teach us the folly of all waste, and that everything is good in its place. The manure from which the early Dutch farmers of New York used to move their barns away and leave behind as useless, is now prized and cared for as of great value to make the land give forth its crops. We can not longer afford the deep vaults as receptacles of human excrement; we can not afford to pollute our rivers of water with it by means of sewers. A little pulverized dry earth scattered in mercy over each addition to this kind of "refuse" or "waste" matter turns all its apparent foulness into treasure for the farmer, fruit-grower, and florist. The kitchen slops poured into a compost heap and properly worked and mixed with soil save the premises from evil and yield their blessing to the garden and the field.

DIFFICULTY WITH GRAHAM GEMS.—Ought I to "fuss" a little? Well, do you know?—I *couldn't* make a graham gem fit to eat for weeks and weeks last summer! Actually, I got to thinking that graham gems must be a humbug, for I tried every way, and nobody would eat my gems if they could get any other bread. I did not hanker for them myself.

There came an article in *HEARTH AND HOME*, beginning with the question: "Did anybody ever see any of those wonderful graham gems, made only of flour and water, which are said to be perfectly light and sweet, 'perfect puffs,' etc.?" This article harmonized with the mood into which I had fallen, and despite all my happy experience of years gone by, I began to read it aloud in a triumphant tone to my husband, who had not ceased to sigh for "good graham gems."

I looked up after reading a little way, and met such a look of astonishment (at my tone and man-

ner I suppose) that I laid down the paper to hear the grave remark: "But we have had graham gems made only with flour and water that were deliciously sweet, perfectly light, and sufficiently tender, and you have made them many a time."

So I had. I was sure of it at that moment. I remembered how I had time and again myself broken open a fresh gem (by the way, they should always be broken and never cut open when warm—the same of all warm bread) with the remark, "Now, if that is not light, I don't see how bread can be light"—alluding to a positive declaration made by one of the wise men of the deceased "Farmers' Club" that unleavened graham bread "could not be made light."

Well, I tried again, asking first to have the stove-pipe lengthened above the roof of the woodshed or summer kitchen where it stood. I had to wait a long time for the oven to get decidedly hot, and Pater had almost finished his breakfast before I could give him a hot gem; but that morning the gems were a success—for the first time in more than three months. We had lovely white yeast bread upon the table that morning, made of the "gilt-edged" or patent flour—exquisitely white, but said to contain a large proportion of the nutritious canaille or middlings. (Will the "humbug man" of the *Agriculturist* please inform us whether this "patent flour" could be classed under the head of "sundry humbugs.") Every one at the table preferred the gems to the much beloved white bread, and that day baby called only for "good gem" when she was hungry for dinner or supper.

The great mistake that I had been making all that time was in not having my oven hot enough when the gems were put into it. The chief secret of making "perfect puffs" lies in having the oven so hot that a skin or crust is very quickly formed, and this confines the expanding air and water as the inside of the gem grows hot, so that the gem comes out of the oven, if the batter has been well stirred and well baked, all full of fine air-holes.

A great many people can not believe that these simple flour and water gems can be really as good as those mixed with sour milk and soda, or with baking-powder, and salted and sweetened. I tried them with baking-powder and sugar, and with yeast, butter, and sugar, but we all do honestly prefer the genuine flour and water gems now that I have regained the secret of making them. New milk is better than water for mixing if you can get it. I have been no more pleased than surprised to find that my children, having grown accustomed to forms of food that were sweet, because they had not been deprived of the natural sweetness of their materials in the processes of preparation for the table, prefer these simply cooked and plainly seasoned dishes to what is called richer food.

It takes a careful cook, who understands the science somewhat, to make plain food palatable. If Bridget leaves the sugar out of your gems or johnny-cake she will probably try to atone for its absence by an extra allowance of salt—something to give the bread a taste you know! As though God forgot that when he contrived the wonderful wheat kernel! But it requires a refined taste, perhaps, to appreciate the peculiar sweetness and delicate flavor of well-cooked wheat.

Chocolate Cake.—Mrs. E. G. B.—Butter, $\frac{1}{2}$ tea-cupful; sugar, 2 tea-cupfuls; flour, 3 tea-cupfuls; milk, 1 tea-cupful; eggs, 4; baking-powder, 1 tea-spoonful. Bake as jelly cake, and put between the layers the following mixture: Into one pint of boiling milk stir one tea-cupful each of grated chocolate and sugar and one table-spoonful of corn-starch. Boil until it forms a smooth paste. In boiling milk, always set the pan with the milk into another vessel containing water, and thus remove all danger of burning.

Corn-Starch Cake.—Mrs. E. G. B.—Sugar, $1\frac{1}{2}$ tea-cupful; flour, $1\frac{1}{2}$ tea-cupful; butter, $\frac{1}{2}$ tea-cupful; corn-starch, $\frac{1}{2}$ tea-cupful; milk, $\frac{1}{2}$ tea-cupful; six eggs, whites only; baking-powder, 1 tea-spoonful. Flavor to taste.

BOYS & GIRLS' COLUMNS.

The Doctor's Talks.

Do you recollect that Mother Goose verse,
Mary, Mary, quite contrary,
How does your garden grow?

It is not the finest specimen of a rhyme, as to make it rhyme properly you have to say *con-trary*, which is contrary to the rules of pronunciation. Perhaps instead of asking Mary, or any other youngster, boy or girl, how her or his garden grows, I had better find out if she or he has a garden. Have you a garden? If not, go to work right off and make one. You will think that a very difficult thing to do, especially those girls and boys who live in towns and villages where land, one of the very first things one needs in making a garden, is very scarce. The word garden covers a wide range, as a garden may be of many acres, only a few feet of a back-yard, or an old soap or similar box filled with earth. In fact, it often happens that the one who has the smallest of these gardens finds more enjoyment in it than those who have very large ones. "Enjoyment" is just what I wish you to have a garden for, and I hope that every boy and girl old enough to read this will this summer have a garden, if it is only just one plant, and that a bean or one of the very commonest seeds. If any of you have never put seeds in the ground and seen plants grow, here is something you can do that will give you pleasure all summer long. Not pleasure only, but you can learn much from a garden, even if it is only a very little one in a box or a pot. The crackling sound when you stroke the cat's back on a cold, dry day in winter is only thunder on a very small scale; the little snaps are from the same cause which follow the same laws as that which makes the stunning thunder-clap. A twenty-acre field of wheat is made up of single wheat plants, and if you sow a single wheat grain and watch it from the seed until the plant that comes from it ripens wheat again, you can learn as much about the way in which wheat grows as if you had a large field to observe. Indeed, you would be likely to learn more, as having but one plant to watch you would have a better chance to see what it was doing than if it were crowded by others. If you can get a small bed in the large garden of your parents that will be very pleasant; but if this not convenient you may be able to find a little spot in some fence-corner somewhere. Those who live on a farm will usually be able to do one or the other of these. Those who can not get a bit of earth in any other way can have a box in some safe place, only a box of earth will often need watering in hot weather. Having the earth, it must be made light and fine by digging and raking, and then it will be ready for the seeds.—

"What seeds shall I sow?" you will ask next; and my answer will be, What you can get. If your mother finds that you wish to have a little garden, you may take my word for it that she will be very glad to help you, and if she has no flower seeds there are no doubt some friends who have will be willing to let you have some. I have noticed that persons who are really fond of flowers are not only willing, but glad to help others who love them. If there are no flower seeds, then take some beans, or squash, or any garden or field plant. Only have something that will grow, and that you can watch from day to day. Don't put your seeds too deep, nor too thick. Small seeds need but very little earth as a covering, and no plants do well when they are crowded. You must ask some older person to tell you how the seeds ought to be sown. A seed—did you ever see anything more wonderful? A little, dry, lifeless body that has been lying still for months, it may be for years. You put it in the ground, and what a wonderful change! A living plant comes from it, that will grow often many feet in length. I don't mean to say that the plant was in the seed, but the beginning of it was—a tiny, baby plant, so to speak, all wrapped up, very much asleep, you will think, to have kept quiet so long, and with enough food with it to keep it growing until it is strong enough and quite ready to run alone. Suppose that all plants had heretofore grown from cuttings or slips of other plants, just as you know some do, and some one should come along with a bag of seed, we will say tomato seed, and declare that each one of these little yellowish things, no bigger than a flattened out pin's head, would produce a large plant that would bear a bushel of fruit, who would believe him? Why, each single seed would be a greater wonder than Barnum's "Great Moral Show." But, oh dear! God's wonders are so manifold, that we all of us, old and young, have our senses confused by their very abundance. As with the seed, the whole of a plant's life is full of wonders, and if you watch your plants carefully you will see every day some new thing. If you have Morning Glories or other climbing plants, just see how they get hold of something to lift up their weak stems; if they twine, like a Morning Glory, just try to make one of them twine in the opposite way, and see

what success you will have. Each leaf as it appears will be a thing of beauty, and then there will be flowers, bright delicate flowers for you to admire. But before the flowers open there will be something to see that is quite as interesting as anything else about them. You must notice, with the single flowers at least, how nicely the parts are packed away in the bud. The parts of the flower are not stowed away all in "a muss," but each as carefully folded as your mother folds her choicest linen. Just see how nicely the Morning-Glory is packed, and how prettily it is twisted, and compare this with the way in which the flower of the Four-o'clock and others are tucked in. Then, as flowers go, seeds will begin to ripen. You will notice that the seeds are in pods or cases of different shapes, and that some of them when ripe open to let the seeds out. The different ways of doing this will bear watching, and if you wish to save any seeds yourself you must learn which plants scatter their seeds naturally and which do not. But I can not tell you all that there is to see in your garden, no matter how small it may be. You have eyes—learn to use them.

THE DOCTOR.

Another Currant Question.

In February last I, the Doctor, answered a little girl's question, who wished to know what the dried currants of the stores were. Now it is Miss Amy, down in Nova Scotia, who wishes to know why our garden currants, which do not come from Corinth at all, are called currants. Don't I wish I could tell her! It is probably because of a resemblance of the two in size and shape (when the store currants are fresh), but I am not sure. I can not find in my library any book that tells when and why the name was given. My oldest book about plants is dated 1640, and they were called *currans* then; but the author says that in some parts of England the currant is called *gozel*, which sounds like an Anglo-Saxon name. If we wished to know why the early inhabitants of Britain called the fruit "gozel" we should be equally puzzled. The study of names is a very interesting one, and I like to see young people wish to know all they can about them. We can learn much about the origin of names, but however far back a name may be traced, there is a point beyond which we can not go. We can learn that most of the words we now use were originally Anglo-Saxon, or from the Latin, French, and other languages, but why the names in these languages were given to particular things is not so easy to discover. The use of sounds to signify things began long before these sounds were expressed in writing, and the early history of language is very obscure. I hope the Nova Scotia Miss will get a more satisfactory answer to her next question, and should she find out anything more about this one I hope she will let us all know.

Aunt Sue's Puzzle-Box.

AUNT SUE'S NOTICES TO CORRESPONDENTS.

BELLA C. E.—To "find out an anagram," print the letters on a piece of card, then cut them apart and rearrange them into the original word. For instance, here is an anagram—"DO, PAT." Now print upon a strip of card (or paper) "D O P A T"; cut each letter separate, and twist them about until you have the original word, which is "ADOPT." The method of making or "finding out square-words" I described very thoroughly in the May number of the *Agriculturist*, 1871.

BESSIE BENNETT.—Very heartily do I exclaim "God speed!" to the women who engage in good works; but in the matter you speak of I dread reaction.

Thanks, for letters, puzzles, etc., to E. S. R., Jere P., F. S., Bessie Bennett, J. B. K., Robt. F. J., B. C. E., Minnie F. D., and W. H. S. F.

All communications for the *Puzzle-Box* should be addressed to "Aunt Sue," P. O. Box 111, Brooklyn, N. Y. [and not ever to the office of the *Agriculturist*.—Ed.]

An Impersonation.

"An Impersonation: what is that?" you will say. The picture is an impersonation. Now, don't be in a hurry and think that impersonation is another name for frogs. To impersonate is to give an animal or other thing the qualities of a person. In the picture frogs are made to appear as persons, and being represented as doing as persons do, they look exceedingly ridiculous. It is just for the ridiculousness of it, the fun of the thing, that we give this picture; for we think it well to have once in a while a nonsense picture with those of a different kind. We do not know but are very sure that this picture was drawn by a French artist. The French have a great fancy for these impersonations, and some of

sects were the only inhabitants, and there carried on all the business and various operations that men and women do in this world. You may imagine that the pictures were very funny. There was a band of music, with

Making an Acquaintance.

We like those boys on the fence, especially the oldest one. The good old cow has a calf, and instead of bouncing roughly into the presence of the frightened little stranger, they make their approach quietly, and one of them brings a gift of welcome in his hand, with the hope of forming an acquaintance. Is there anything more awkward and, so to speak, unreasonable, than a young calf? It has no beauty in its early days and is exceedingly obstinate and stupid. It seems to know just one thing: that its mother's milk is its own property, and there is just one right and proper way for it to get it, and it takes a great deal of teaching and requires great patience in the teacher to make it drink milk. It is not likely that the calf will eat the apple that the boy has brought, but it shows that the youngster knows what every boy and girl ought to know, that the way to treat all animals is to make friends with them from the beginning. The little calf does not meet the boys' advances now, though the mother does in her looks seem to try to encourage it; but it will soon, and before long will be glad to have the boys pet it. Did you ever notice the difference between colts that had been petted from the first and those that had been "shooed" at just to see them kick up their heels and scamper across the pasture? We have seen colts not a year old that would come from any part of a large lot when called, and seem to enjoy a little petting and coaxing as much as a boy enjoys approving words from his father or mother. When colts and calves hear only pleasant tones, when they are taught, as they soon may

be, to look upon us as their friends, there will be little need of what is called "breaking" of horses or steers; having been always treated kindly, they may be taught without trouble to do what is required of them. Animals that have become attached to you by kindness

I OUT, AND CURL AND SHAVE WITH CARE, AND TO BALD HEADS RESTORE THE HAIR.

crickets and all the noisy insects playing away for dear life. A quack doctor, represented by a duck with his patient, very properly a goose, and all sorts of amusing things. Frogs are especially suited to this kind of impersonation, and in the picture the obsequiousness of

MAKING AN ACQUAINTANCE.

their artists are wonderfully skillful at making them. We have seen a large French book, called "Another World," in which the writer pretends that in some mysterious way he went to some planet where heasts, birds, and in-

the barber and the patience of his sitter are very cleverly done; and we must not forget to notice the satisfaction with which the one who has had his "shave" takes his sun-umbrella, and walks off to pleasure or business.

appear to really wish to please you if they only know what you want them to do. They are slow in finding this out, and need a great deal of patient showing. When they once understand they will gladly obey.

Life Insurance.

HOW to get money, or to keep it, is by no means the most difficult or desirable of accomplishments. It requires but a very ordinary ability; and if that ability is not accompanied by other qualities of a higher order, its possession is not to be greatly coveted. But one thing it does require, without which no ability can succeed, and that is—money. A fortune can no more be acquired without some capital to start with, than a crop of corn can be raised without corn to plant. The plowing and cultivating may be done ever so diligently and well, but without the seed there can be no crop.

That "first thousand dollars" necessary to a successful embarkation after the golden fleece must first be obtained, or the ambitious argonaut sets his sails and launches his ship in vain. Thousands and tens of thousands have essayed the voyage without it, only to meet with certain shipwreck of fortune or character, or of both. In the effort to get that "first thousand dollars" what years of weary toil and care must usually be expended.

The number is almost incalculable of those who, having the power of success, lack the means; and whose lives, that might yield a rich revenue of good, are spent in comparatively profitless drudgery, delving after that "first thousand dollars," the possession of which is to be the corner-stone of future fortune.

There is but one way for the poor man to save his children from this slavery, and that is by leaving them the little legacy which delivers from the necessity that has been laid upon him, and puts them on the high road to success, if the elements of success be in them. To do this in a single sum, by a single saving, is impossible; but to do it by many savings of many sums is possible, if life is spared him until the end is attained.

But, if life is not spared, what then? Why, for his children, the same dreary, hopeless life which he has endured.

From this the United States Life Insurance Company, of this city, eminent among the best of such institutions for its safety, economy, and liberality, furnishes a ready deliverance. It furnishes to every man the way of purchasing for his little ones that golden key which unlocks the door of opportunity—that "start in life" which wins the race—that "first thousand dollars," which is the fulcrum resting upon which, with the leverage of faith and industry and honesty, the world itself may be moved.

Consumers Importing Tea Co., No. 8 Church Street, P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers Importing Tea Co., No. 8 Church Street, P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D. C.

THE BEST PAINT

IN THE WORLD.

Branch Office and Factory: 506 West Street, NEW YORK, Any Shade from Pure White to Jet Black.

A combination of the purest paint with India Rubber, forming a SMOOTH, GLOSSY, FIRM, DURABLE, ELASTIC, and BEAUTIFUL Paint, unaffected by change of temperature; is perfectly water-proof, and adapted to all classes of work, and is in every way a better paint for either inside or outside painting than any other paint in the world. Being from one fourth to one third cheaper, and lasting at least three times as long, as the best lead and oil paints.

Be sure that our TRADE-MARK (a fac-simile of which is given above) is on every Package.

Prepared ready for use, and sold by the gallon only. There has never been a paint offered the public that has become so popular (in the same time) and given as perfect satisfaction as the Rubber Paint. Send for sample card and testimonials.

TO FARMERS & PLANTERS.

DOUBLE REFINED POUDERETTE for sale in lots to suit customers. This article is sold for half the price of other fertilizers, and is cheaper for Cotton, Corn, Tobacco, and Vegetables than any other in the market. Price, delivered on board in New York City, \$25 per ton. Task attention to the following testimonials:

CHARLES A. MESSENGER, Providence Co., R. I., writes: "The Double-refined Poudreite I bought of you has given satisfactory returns, and I consider it the best of anything I can use for an early crop."

THOMAS W. LATHAM, Providence Co., R. I., writes: "I would rather have your Double-refined Poudreite than any phosphate I ever used. Where I used it on Potatoes it was far ahead of any other manure."

L. H. SHELDON, Sup't of the New Jersey State Reform School, writes: "We have used Poudreite for several years upon our farm crops, and for the money invested we have found nothing that has done us so much service."

S. J. KELLY, Burlington Co., N. J., writes: "I used Double-refined Poudreite on Rutabaga Turnips alongside of Peruvian Guano and Hen Manure. Where the Poudreite was applied the increase was thirty per cent over the others."

WILLIAM H. CADDY, Ocean Co., N. J., writes: "I used Poudreite on Corn, Sweet and round Potatoes, Onions, and Lima Beans. It brought forward my crops two weeks earlier. I think it the best manure I ever used, giving better results than Peruvian Guano, at much less cost."

VAN ANTWERP and VAN BUREN, Montgomery Co., N. Y., writes: "Poudreite has been used in this locality for ten years past, mostly on Corn, and those who have used it say they have from 1/4 to 1/2 more Corn by using the Poudreite."

W. F. GERKIN, of Essex Co., N. Y., writes: "I have used the Double-refined Poudreite for the last five years, and I consider it the cheapest fertilizer I can buy—giving the best results for the cost."

MILTON STRONG, Suffolk Co., N. Y., writes: "I gave Poudreite a thorough trial this year, using it upon Corn, Potatoes, Lima Beans, Tomatoes, and Vines, and I have never raised better crops. My Corn will yield 100 bushels of ears per acre, and my garden was the surprise and admiration of all who saw it."

HENRY T. HORTON, Cheshire Co., N. H., writes: "I find, from experiments made last year, the Double-refined Poudreite is the cheapest fertilizer to use on Tobacco. I put it beside Peruvian Guano with equal cost of both, and the Tobacco was 30 per cent better where I used Poudreite."

W. H. REMINGTON, Hartford Co., Ct., writes: "I have used Poudreite on Corn, Potatoes, and Tobacco. There was but one piece of Corn in the place equal to mine, and that had 30 loads of manure per acre and mine none. The Tobacco started as soon as set and grew luxuriant."

WM. S. POMEROY, of Hartford Co., Ct., writes: "I have used the Double-refined Poudreite for several years on Tobacco, and I think it one of the best fertilizers made for this crop."

A Pamphlet giving full directions, etc., sent free on application to

JAMES T. FOSTER,
66 Cortlandt Street, New York.

GENUINE Peruvian Guano.

FARMERS, AGRICULTURISTS, and DEALERS in Fertilizers have now an opportunity of obtaining this valuable manure in small or large lots, at importers' prices, by applying to the Special Agency just established for the purpose of delivering Genuine Peruvian Guano to consumers at any accessible port or railway station in the country. Full particulars given in circular mailed free on application to

R. BALCAZAR,

ESTABLISHED 1855.

Carbonized Enamel IS AS PURE AS GLASS.

The Bridgeport M'fg Co.,
OF BRIDGEPORT, CONN.

(Office, No. 88 Chambers St., New York),
Have the exclusive control of this valuable enamel, and are using it to cover all of their celebrated

American Submerged Force Pumps.

They also enamel pipe inside and out, which delivers the water chemically pure. The Enamel is composed of vegetable matter, baked on so hard that a blow does not break it, and it resists acids that eat gold.

Gentlemen: I have examined the sections of Carbonized Enamel Pipe submitted to me by you. It is superior to any pipe I have ever seen for resisting acids and conducting water from springs or for use in connection with pumps, etc. The Enamel adheres with astonishing tenacity, withstanding even heavy blows; and the surface of the metal where the enamel is beaten off seems to be protected against the ordinary action of water.

M. C. WELD,

Late Associate Editor *Am. Agriculturist*.

MUDGE & WOODS, No. 88 Chambers St., N. Y.,
are the exclusive selling agents of the Bridgeport M'fg Co. for the Licenses of States, counties, and towns rights for the American Submerged Suction and Force Pumps.

THE PULSOMETER.

The simplest, most durable, and effective steam pump now in use. Will pump gritty or muddy water without wear or injury to its parts. It can not get out of order.

AGENTS WANTED FOR THE LIFE AND PUBLIC SERVICES OF

Charles Sumner,

By **C. EDWARDS LESTER.**

This work has been long in preparation, and is now completed, with an account of his lamented death; the tributes of the nation at his grave, and the universal sorrow of the friends of humanity throughout the world. The volume will embrace about 600 pages, 8vo., with a portrait on steel of the late Senator, and numerous illustrations. Send \$1.50 for prospectus, certificate for territory, and outfit. **U. S. PUBLISHING CO.,** New York.

AGENTS WANTED FOR THE HISTORY OF THE GRANGE MOVEMENT OR THE FARMER'S WAR AGAINST MONOPOLIES.

Read what leading Grangers say of the book: **T. A. THOMPSON, Esq.,** Lecturer of the National Grange, writes: "There is a great demand for information concerning the Order. This you have met in your *History of the Grange Movement* in an admirable manner. The work is opportune, and merits an extensive circulation."

Col. A. B. SMEDLEY, Master of the Iowa State Grange, writes: "I have received your very excellent book; am much pleased with it. Many thanks for the copy sent me. I prize it highly."

Mr. D. B. MAUGER, Master of the Penn'a State Grange, writes: "I return to you my sincere thanks for the *History of the Grange Movement*. I have perused it with much interest. It is indeed stored with 'Golden Grain' for every Patron's family, and should be in the household of every Patron in the land. I can cheerfully recommend it." Send for specimen pages and circulars containing terms to Agents, and many more endorsements from leading Grangers. Address

NATIONAL PUBLISHING CO., Philadelphia, Pa. **CAUTION.** Unscrupulous publishers have taken advantage of the great demand for this *History of the Grange Movement*, to issue unreliable works on the subject—mere compilations from agricultural newspapers. Do not be imposed upon. See that the book you buy is indorsed by the leading Grangers.

AGENTS WANTED for the new book,
LIFE AND ADVENTURES OF
A Kit Carson
by his comrade and friend, **D. W. C. PETERS, Brevet Lt. Col. and Surgeon, U.S.A.,** from facts dictated by himself. The only TRUE and AUTHENTIC life of America's greatest HUNTER, TRAPPER, SCOUT and GUIDE ever published. It contains full and complete descriptions of the Indian tribes of the FAR WEST, as seen by Kit Carson; who lived among them all his life. It gives a full, reliable account of the MODOCs, and the MODOC WAR. As a work of HISTORY, it is invaluable. A grand opportunity for agents to make money. Our illustrated circulars sent free to all applicants. Write and secure territory at once. **DUSTIN, GILMAN & CO.,** Hartford, Conn.

Do you want Employment

We will give you immediate, steady, honorable work, which will pay you beyond all your expectations. Thousands at work for us are now making from \$100 to \$300 per month, and thousands more can do it. The business is in introducing our publications in your own and other towns. With MARK TWAIN'S or JOSH BILLINGS'S new works, with "MY OPINIONS and BETSEY BOBBET'S," and with many others out of our list, you can secure a fine income easily. Write us for information. We send it full and free. Address **AMERICAN PUBLISHING CO.,** Hartford, Conn.

IMPORTANT TO INVENTORS.
American Agriculturist
PATENT DEPARTMENT

In compliance with the request of numerous inventors, we have organized a PATENT DEPARTMENT in connection with this office for the transaction of all business connected with

Securing Patents in the United States and foreign countries. The character for Reliability which has been maintained by the AMERICAN AGRICULTURIST for more than thirty years will be carefully guarded in this as in other departments.

All Inventors desirous of procuring patents at moderate cost are invited to forward (express prepaid) a model of their invention, with a brief description of its working. The model should not exceed one cubic foot in dimension. Upon receipt of model an opinion as to patentability will be given free of charge.

Preliminary Examination at the Patent Office, to determine patentability, will be promptly made for a fee of \$5. Litigation of Patents.

The services of the best counsel have been secured to prosecute or protect before the U. S. Courts and the Patent Office the claims of those intrusting their business to this agency.

Specifications, drawings, engravings, models, and all other appliances furnished at moderate prices.

In all dealings with this Department inventors may depend upon promptness, fidelity to their interests, and the best services which can be rendered by thorough experts. For full particulars, address

AMERICAN AGRICULTURIST PATENT DEPARTMENT,
ORANGE JUDD COMPANY,
245 Broadway, New York.

PRAIRIE, CORN-FIELD AND HERD OF CATTLE, SIX MILES WEST OF LINCOLN, NEB.

**IF YOU WANT A FARM OR HOME,
YOU SHOULD BUY OF THE
BURLINGTON AND MISSOURI RIVER RAILROAD CO.
IN IOWA OR NEBRASKA.**

- BECAUSE**—Their prices are low, ranging for the best land from Three to Ten Dollars per acre.
- BECAUSE**—No payments are required of the purchaser for four years, except interest at six per cent.
- BECAUSE**—After the fourth year only one seventh of the principal is payable annually till the whole is paid.
- BECAUSE**—You are not required to go into a wilderness, these being well-settled States, the population of which is rapidly increasing.
- BECAUSE**—The mildness of the climate and fertility of the soil is such that the settler can pay for his farm from the products raised upon it long before the time when the principal becomes due.
- BECAUSE**—Failure of crops from drought is unknown.
- BECAUSE**—Large allowances are made upon fare and freight, thus giving low rates on both to purchasers of this Company's lands.

AND YOU SHOULD BUY THIS YEAR.

BECAUSE—Purchasers of our lands in Nebraska during 1874 who cultivate one-half their land within two years from their purchase are allowed a reduction of twenty per cent on its price. **LARGE DISCOUNTS** also, FOR CASH, within One, Two, or Five Years.

Send for Circulars, with full information on all points, to

GEO. S. HARRIS, Land Commissioner,

At Lincoln, Nebraska, for land in Nebraska. At Burlington, Iowa, for land in Iowa.

S. BRAINARD'S SONS,
Cleveland, Ohio.

Newly Revised and Enlarged Edition.

Practical Floriculture.

A Guide to the Successful Propagation and Cultivation of Florists' Plants.

By PETER HENDERSON,
Author of "Gardening for Profit."

Beautifully Illustrated. Price, Post-paid, \$1.50.

In this work, which has everywhere become so deservedly popular, not only is the whole "art and mystery" of propagation explained, but the reader is taught how to plant and grow the plants after they have been propagated. The work is not one for florists and gardeners only, but the amateur's wants are constantly kept in mind, and we have a very complete treatise on the cultivation of flowers under glass, or in the open air, suited to those who grow flowers for pleasure as well as those who make them a matter of trade. The work is characterized by the same radical common sense that marked the author's "Gardening for Profit," and it holds a high place in the estimation of lovers of floriculture. The new edition has been thoroughly revised by the author, and much enlarged by the addition of valuable matter.

The following are a few of the subjects embraced in the latest edition:

Laying out Flower Garden and Lawn; Designs for Grounds and for Greenhouses; Soils for Potting; Cold Frames; Hot-Beds; Greenhouses Attached to Dwellings; Modes of Heating; Propagation of Plants by Seeds and by Cuttings; Culture of the Rose and Tuberoses; Growing of Water-flowering Plants; Construction of Bouquets, Baskets, etc.; Parlor and Window-Gardening; Wardian-Cases and Ferneries; Insects; What Flowers Grow in the Shade; Culture of Grape-Vines under Glass; The Profits of Floriculture; How to Become a Florist, etc., etc.

THE ILLUSTRATED Book of Poultry,

With Practical Schedules for Judging, Constructed from Actual Analysis of the Best Modern Decisions.

By LEWIS WRIGHT,
Author of "The Practical Poultry Keeper," "The Brahma Fowl," etc.

ILLUSTRATED WITH Fifty Colored Portraits of Prize Birds, Painted from Life by J. W. Ludlow.

THE PRACTICAL POULTRY KEEPER.

A COMPLETE AND STANDARD GUIDE TO THE MANAGEMENT OF POULTRY, FOR DOMESTIC USE, THE MARKETS, OR EXHIBITION.

Beautifully Illustrated.

By L. WRIGHT.

NOTICES BY THE PRESS.

This book is a valuable manual for everybody who feeds chickens or sells eggs. It suits at once the plain poultryer who must make the business pay, and the chicken fancier whose taste is for gay plumage, and strange, bright birds. The most valuable portion is the first section, extending through fifty-five pages. These were written with the intention of producing a manual so plain, minute, and practical, that any one could, by using it as a guide, with no previous experience with poultry, become at once successful in producing eggs, young chickens, and fat fowls for market. The author has not missed his aim. The middle parts of Mr. Wright's Manual are taken up with minute directions for making show fowls for Fairs, a nice discussion of the good and bad points of the different breeds, and a brief sketch of such fancy stock as peafowl, pheasants, and water-fowl. Then follows a section on artificial hatching, and another, worth special attention, on large poultry yards. . . . A study of Mr. Wright's book will convince any farmer's wife that all she needs is to give a half hour each day, of intelligent and sagacious attention to her poultry, in order to obtain from them, not tape, and knitting needles, and buttons, and nutmegs merely, but the family supplies of sugar, shoes, and cloth. *New York Tribune.*

It is the most complete and valuable work on the matters of which it treats yet published. It will be found a plain and sufficient guide to any one in any circumstances likely to occur, and is illustrated with elegant engravings of many breeds of fowls. *Farmers' Cabinet.*

This is a reprint, with numerous wood engravings, of an English book, the object of which is to convey in plain language a great deal of practical information about the breeding and management of poultry, whether for domestic use, the markets, or exhibition. . . . The book is eminently practical, and we recommend it to farmers and others interested in breeding and selling poultry. *Philadelphia Press.*

It is a handsome volume, brought out in the best style, and enriched with nearly fifty illustrations. It is evidently the fruit of a thorough, practical experience and knowledge of fowls, and will be found a plain and sufficient guide in all the practical details of poultry management as a profitable business. *United Presbyterian.*

The subject is treated fully and ably by an experienced hand, and the volume will doubtless find a large sale among the growing class of poultry fanciers. It is embellished with numerous illustrative engravings. *New York Observer.*

The author has called to his aid all who were experienced in the subject whereof he writes, and the consequence is a volume of more than ordinary thoroughness and exhaustiveness. *Rochester Democrat.*

The book is a complete and standard guide to the management of poultry for domestic use, the market, and for exhibition. *Watchman and Reflector.*

PRICE, POST-PAID, \$2.00.

ORANGE JUDD CO.,
245 Broadway, New York.

ATWOOD'S Country and Suburban HOUSES.

By DANIEL T. ATWOOD
ARCHITECT.

Illustrated with about 150 Engravings.

NOTICES BY THE PRESS.

The work is one that can well be read by every man about to build or buy a place of residence, as the author has much to say—and says it in a direct and simple manner—on all points connected with a matter so important, and which so closely concerns the comfort and the health of all persons. —*Traveler (Boston).*

The part of the volume preceding the designs contains useful suggestions on selection of localities, modes of building, properties of timber, painting, etc.—*Country Gentleman (Albany, N. Y.)*

It is a volume of nearly three hundred pages, amply illustrated, containing hints and suggestions as to the general principles of house-building, style, cost, location, symmetry, and modes of building. It is especially designed to encourage a taste for pleasant country houses.—*The Freeman (Montpelier, Vt.)*

This is a useful and valuable work, filled with suggestions as to the general principles of house-building, illustrated with about one hundred and fifty engravings.—*Watchman and Reflector (Boston).*

There is much in the book to recommend it to the attention of all; particularly the remarks on building material, appropriateness, the effects of different combinations of paints to produce harmonious colors, etc.—*State Republican (Lansing, Mich.)*

A splendid volume, illustrated with about 150 engravings. The directions and statements it gives are eminently plain and practical, and seem sufficient for the establishment of something more than houses merely, and that is homes.—*Rutland Herald (Vt.)*

An admirable work. It is just the book for any one contemplating the erection of a house or barn.—*Farmers' Cabinet (Amherst, N. H.)*

There are single chapters in it which are worth more than the price of the work (\$1.50), not only to those who are building anew or building greater, but to such as contemplate improvements, and, unfortunately—owing to bad jobs at the beginning, or decay's effacing fingers—there are few homes about which improvements are not needed.—*The World (New York).*

A valuable work, gotten up in the best style. It must prove both interesting and useful to all who wish a home in which beauty, taste, convenience, and economy are combined.—*United Presbyterian (Pittsburgh, Pa.)*

It contains some practical and common-sense advice as to the selection of sites, etc., which should be carefully considered by every one who is seeking where to locate his home, while the information given as to the principles and details of building is also of the utmost value for putting one in a position to know if he is having his work well done and getting his money's worth.—*Evening Mail (New York).*

PRICE, POST-PAID, \$1.50.

"UP FOR REPAIRS,"

A Beautiful, New Picture for Every Subscriber to the

American Agriculturist

FOR 1874.

An exquisite Oil Painting by the celebrated American Painter, Mr. B. F. Reinhart, executed expressly for the *American Agriculturist* and entitled

"UP FOR REPAIRS,"

has been most successfully reproduced in Chromo by the well-known firm of Beneke & Scott. It is a picture of a scene in childhood, which many will recognize as what they have themselves witnessed or been actors in, and can not fail to please both old and young.

The Publishers will give this beautiful Chromo

To Every Subscriber

to this paper for the year 1874 received after this date, as detailed below. It is ready for immediate delivery at 245 Broadway, Free of Charge.

If to go by mail, 10 cents must be sent to cover cost of packing and postage. For 25 cents it will be Mounted, Varnished, Packed, and sent Post-paid.

N. B.—The Chromo will be delivered:

- At the Office, **Umounted**, Free.
- " " **Mounted**, 15 cents extra.
- Sent by Mail, **Umounted**, 10 cents extra.
- " " **Mounted**, 25 cents extra.

We advise all to have them mounted before leaving the office, as in the large quantities we put up we are able to mount them for a quarter of the cost of doing it singly, and better than it can usually be done elsewhere.

The picture is designed for every subscriber upon the terms stated above, which please read carefully; and on these terms all are alike entitled to it, whether their names come singly at \$1.50 each, or in Clubs of Four for \$5, or Clubs of Ten at \$1.20 each, or in Clubs of Twenty or more at \$1 each. Subscribers in Premium Clubs will also thus be entitled to it.

N. B.—A few of the beautiful pictures entitled "MISCHIEF BREWING," which have been given to so large a number of subscribers, are still in stock, and, while any remain, subscribers to the *American Agriculturist* can have their choice between this and the new Chromo "UP FOR REPAIRS"; but the choice must be named at time of subscribing. ORANGE JUDD COMPANY,

245 BROADWAY, NEW YORK.

BEAUTIFYING COUNTRY HOMES.

AN ELEGANT QUARTO VOLUME.

By J. WEIDENMANN.

PRICE, POST-PAID, \$15.00.

This magnificent work is illustrated not only with numerous fine wood-engravings, but also with seventeen full-page and seven double-page colored lithographs of places already improved. It embodies the results of a long practice in landscape architecture and rural adornment, and while its teachings are in accordance with the received rules of art, they are thoroughly practical in their character. It is one of the most elegant, and ought to prove one of the most useful works ever issued in the country. The work, both in its letter-press and colored lithographs, is beautifully printed, and it is elegantly bound in beveled boards.

Hussey's National Cottage Architecture.

New and Original Designs, Working Scale Drawings, and Details for all Styles of low-priced Houses, with Specifications and Cost. Just published. Royal quarto. Post-paid, \$6.

MONCKTON'S NATIONAL STAIRBUIDER. } SIX DOLLARS, post-paid.

MONCKTON'S NATIONAL CARPENTER and JOINER. } SIX DOLLARS, post-paid.

Either of the above books sent post-paid on receipt of price by

Orange Judd Company, 245 Broadway, N. Y.

Beckwith Sewing Machines \$12 and \$20.

We have offered as a Premium, and also for sale, for more than a year past, the Beckwith Sewing Machine, which has been fully described in previous numbers of this paper.

We still offer the Beckwith Sewing Machine, Improved, price \$12. A new and very simple braiding-foot has been made, by which a child can sew on braid without the least trouble, following any desired pattern with ease;

Each of these machines is put in a neat, compact box, with hemmer and guide, oil-can with oil, thread, different-sized needles, etc., with full Printed Directions for using.

The Machine as a Premium.

We will give one of these \$12 machines to any one who will collect and forward eight subscribers for Hearth and Home one year at \$3 each; or sixteen subscribers to American Agriculturist for one year, at \$1.50 each.

THE BECKWITH PORTABLE FAMILY SEWING MACHINE.

PRICE \$20.

Enlarged and Improved. Its Weight is 7 Pounds.

While we continue the offer of the Improved \$12 Machine as heretofore, we now offer the new

PORTABLE FAMILY MACHINE,

price \$20, which comprises all the excellencies of the former, with many valuable improvements. Its size and power are increased, and its capacity thus very much enlarged, without impairing its portability.

To any one sending us \$20, we will send one of the Machines (packed in a neat, portable case, with handle to carry it easily), expressage to be paid by purchaser.

The Machine as a Premium.

We will give one of these \$20 Machines to any one who will collect and forward to us Fifteen Subscribers to Hearth and Home for one year at \$3 each, or Thirty Subscribers to American Agriculturist for one year at \$1.50 each, or One Hundred at \$1 each, expressage on the Machine to be paid by the recipient of it.

Almost any lady can readily secure the small number of subscribers required to get either the \$12 or the \$20 Machine as described above; or some friend can thus obtain it for her as a present.

ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

DO GOOD AND MAKE MONEY.

The Publishers of American Agriculturist and HEARTH AND HOME take pleasure in presenting in the adjoining Table, their new general Premium List for 1874. The Premiums which they have offered in past years have engaged the attention of a very large number of persons of all ages and both sexes.

Here is pleasant and profitable work for all. Any one who wishes to do good and make money, can do both by going to work as here invited by the publishers of these two most valuable journals, American Agriculturist and HEARTH AND HOME.

Explanatory Notes.

N. B.

Read and carefully

Note the following Items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But... (b) Tell us with each name or list of names sent, that it is for a premium... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once.

[In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 a year for American Agriculturist, and \$3.00 a year for Hearth and Home; also at the club rates of \$1 and \$2.50; also at the rates of \$4 a year for both papers together.]

N. B.—In all Premium Clubs for either paper, TWO copies of American Agriculturist (English or German) at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same.

Table of Premiums and Terms for American Agriculturist, and for Hearth and Home, for the Year 1874. Includes columns for article names, prices, and subscriber requirements.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 2 to 8, 27 to 33, 55 to 78, and 81 to 93, inclusive, will each be delivered FREE of all charges, by mail or express.

PRESERVE YOUR STOVES from Rust by polishing them with GEM STOVE POLISH before putting them away for the summer.

THE HOOSIER SCHOOL-MASTER.

By EDWARD EGGLESTON. Finely Illustrated, with 12 Full-Page Engravings, and Numerous Other Cuts.

NOTICES BY THE PRESS.

It is full of quaint humor, a tender pathos, and vivid descriptions.—New York Standard.

The "events" are stirring and dramatic, and the style is quiet, impersonal, and almost epigrammatic in its ability to lay bare an entire situation or character in a sentence or phrase.—Brooklyn Daily Eagle.

It is at once quaint and truthful, and illustrated as it is by masterly cuts, it should be one of the most popular books.—Christian Standard (Cincinnati).

For realistic conception and life-like delineation of character, it is not excelled by any American story.—Methodist. Some passages in it, for life-like delineation and the simple, artless beauty which constitute the highest perfection of story-writing, are equal to some of the very best passages in Dickens.—Religious Telescope.

PRICE, POST-PAID.....\$1.25.

The End of the World.

A LOVE STORY.

By EDWARD EGGLESTON,

Author of "The Hoosier School-Master."

WITH

Thirty-two Fine Illustrations.

NOTICES BY THE PRESS.

The personages who figure in this story are, with one exception, country people—such men and women as Wordsworth loved to study. It is not every man, whatever may be his talents, that can safely enter this sphere of literary labor. To be successful in it, he must possess exceptional qualities; but for those who know how to find it, here there is gold of the purest, richest kind. In such a work, however, there is no convenient place where mediocrity can rest; there is nothing but absolute failure or absolute success. And Mr. Eggleston has succeeded. His power lies in the delineation of character. The plot is ingenious and natural, the incidents are managed with great skill, and there are many descriptive passages of singular force and beauty. But the strongest impression left on the reader's mind as he closes the volume is that he has been in the company of very interesting men and women, and has made a number of new and valuable acquaintances.—The Albion, New York.

Price, Post-paid, \$1.50.

The Mystery

OF

Metropolisville,

By EDWARD EGGLESTON,

Author of "The Hoosier School-Master," "The End of the World," etc.

FINELY ILLUSTRATED.

ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

A Man of Honor.

By GEORGE CARY EGGLESTON. Finely Illustrated.

The publishers take pleasure in commending this as one of the most charming stories that has been presented to the American people. Mr. Eggleston has given to it, with rare fidelity, the local coloring of the part of the country where its scenes are laid. It is a realistic story of life in the Old Dominion. Its people are ladies and gentlemen. Robert Pagebrook, the "Man of Honor," is every inch a man, and his sayings and doings at once attract and hold the reader's attentive interest. It is a love-story, too, and has the merit, which is not as common as it might be nowadays, of ending to the reader's entire satisfaction.

NOTICES BY THE PRESS.

A capital picture of Life in Old Virginia before the war is to be found in Mr. George Cary Eggleston's "A Man of Honor." Virginian hospitality, Virginian cousinship, Virginian housekeeping, are portrayed in accurate and attractive colors. It is a life which the author has himself known and loved, and he writes of it with a warmth that comes from the heart.—N. Y. Evening Post.

Really readable in the most refreshing sense of the term—a story of the most amusing and attractive interest.—St. Louis Times.

It is written in an off-hand manner, and is bright and amusing.—Worcester, Mass., Spy.

With Virginian life as a specialty, Mr. Eggleston has drawn a simple, straightforward, truthful, and withal, artistic picture of Southern society. It is sketchy, perhaps too much so, but the sketches are all vigorous and show the hand of a practiced artist. In forming the characters of his book it is evident that Mr. Eggleston has drawn oftener on his memory than on his imagination; that he has lived among the people whom he describes, has heard them talk, and seen them under all the moods of ordinary life.—Boston Daily Advertiser.

CONTENTS.

Chapter 1. Mr. Pagebrook gets up and calls an Ancient Lawgiver.—2. Mr. Pagebrook is Invited to Breakfast.—3. Mr. Pagebrook Eats his Breakfast.—4. Mr. Pagebrook Learns Something about the Customs of the Country.—5. Mr. Pagebrook Makes some Acquaintances.—6. Mr. Pagebrook Makes a Good Impression.—7. Mr. Pagebrook Learns Several Things.—8. Miss Sudie Gets an Apt Quotation.—9. Mr. Pagebrook Meets an Acquaintance.—10. Chiefly Concerning "Foggy."—11. Mr. Pagebrook Rides.—12. Mr. Pagebrook Dines with his Cousin Sarah Ann.—13. Concerning the Rivulets of Blue Blood.—14. Mr. Pagebrook Manages to be in at the Death.—15. Some very Unreasonable Conduct.—16. What Occurred Next Morning.—17. In which Mr. Pagebrook Bids his Friends Good-by.—18. Mr. Pagebrook Goes to Work.—19. A Short Chapter, not very interesting, perhaps, but of some importance in the Story, as the Reader will probably Discover after awhile.—20. Cousin Sarah Ann Takes Robert's Part.—21. Miss Barksdale Expresses some Opinions.—22. Mr. Sharp Does his Duty.—23. Mr. Pagebrook Takes a Lesson in the Law.—24. Mr. Pagebrook Cuts Himself Loose from the Past and Plans a Future.—25. In which Miss Sudie Acts very Unreasonably.—26. In which Miss Sudie adopts the Socratic Method.—27. Mr. Pagebrook Accepts an Invitation to Lunch and Another Invitation.—28. Major Pagebrook Asserts Himself.—29. Mr. Barksdale the Younger goes upon a Journey.—30. The Younger Mr. Barksdale Asks to be Put upon his Oath.—31. Mr. William Barksdale Explains.—32. Which is also the Last.

ILLUSTRATIONS.—By M. WOOLF.

"Now I've Got You" (Frontispiece).—Mr. Robert Pagebrook was "Blne."—"I Fall at Once into a Chronic State of Washing up Things."—"Foggy."—Cousin Sarah Ann.—The Rivulets of Blue Blood.—Miss Sudie Declares Herself "so Glad."—"Let Him Serve it at Once, Then."—"Very Well, Then."—"I'm as Proud and as Glad as a Boy with Red Morocco Tops to his Boots!"

IN PRESS.

READY THIS MONTH.

A New and Revised Edition of Peter Henderson's well-known Work,

Gardening for Profit.

A Guide to the Successful Cultivation of the Market and Family Garden.

By PETER HENDERSON.

Finely Illustrated. Price, Post-paid, \$1.50.

The following voluntary notice of this work comes from a Western market gardener and shipper of vegetables, and is a specimen of similar testimony from very many quarters.

March 23d, 1874.

"If this should go to Mr. Henderson, I would say that I believe the gardeners of this country would gladly hail another edition of 'Gardening for Profit;' at least, I thank him for that little work. Through its influence I left a paying manufacturing business and began to follow its teachings. This was three years ago. Now I have a market garden of thirty acres and 400 four-foot sash, and enjoy myself as I never did before. Again I thank him."

ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

JUST PUBLISHED.

JOHN ANDROSS.

BY

REBECCA HARDING DAVIS,

Author of "Life in the Iron Mills," "Dallas Galbraith," etc., etc.

ILLUSTRATED.

The genius of George Eliot finds not only a peer, but a counterpoint in that of Mrs. Rebecca Harding Davis. The resemblance between these two seems a growing one, and as "John Andross" unfolds itself more and more, the points of similarity between it and the best of George Eliot's work become more and more strongly marked. Not that "John Andross" is in any sense an imitation, or its author in any sense an imitator. The similarity is not sameness; the resemblance is by no means a likeness. In "John Andross" we find the same boldness of touch, the same consciousness of strength, that delight us in every page of "Middlemarch." The two authors are alike in the confidence with which they discard all models and become a law unto themselves. There is no resemblance whatever between the people created by the one and those who serve the purposes of the other, except that the personages of each are undoubted originals always. The machinery by which Mrs. Davis brings her people before us, and shows us what manner of men they are, is totally unlike that which George Eliot uses, and their plots resemble each other in nothing except in their utter unlikeness to any others in the world, their entire originality, and their unusual fitness to serve the ends for which they are created.

Another point of resemblance between the two writers is the masterly knowledge each seems to have, from first to last, of the peculiarities of character which underlie the actions of her people. The weakness of Andross's chin is as necessary a part of him as the chin itself is. His irresolution; his honesty of purpose, and his inability to make it honestly of practice; his desire for good, and his choice of evil; his sudden elevations and depressions of spirit; his vacillation; all these and the character of which they are born are open secrets to Mrs. Davis. She makes no analysis of character, and tells us nothing about the mental and moral muscles which her personages bring into play. She simply holds her lens before our eyes, and her people become transparent. We see for ourselves how they are made up, and we see the several parts in actual play before us.

Play and Profit IN MY GARDEN.

By **E. P. ROE,**

Author of "Barriers Burned Away," etc.

NOTICES BY THE PRESS.

The author takes us to his garden on the rocky hill-sides in the vicinity of West Point and shows us how out of it, after four years' experience, he evoked a profit of \$1,000, and this while carrying on pastoral and literary labors. . . . It is very rare that so much literary taste and skill are mated to so much agricultural experience and practical good sense.—*Harper's Magazine.*

This book is as poetical as it is practical. Still he is no dreamer. He goes into every essential detail with as much minuteness and precision as if he were writing a manual for the practical farmer. Indeed few works professedly devoted to agriculture give more sound and valuable information on the secret of winning golden harvests from the soil than this brief idyllic sketch.—*N. Y. Tribune.*

A very charming book, not only by reason of its pleasant style, but for its quiet refined humor and fund of really useful information on the subject of gardening.—*Boston Gazette.*

It deserves to stand side by side with "My Summer in a Garden."—*Christian Register.*

A fresh, lively work.—*N. Y. Observer.*

One reads without weariness and learns much of practical value.—*Chicago Evening Journal.*

Full of information. Explains just what the reader wishes to know. We most heartily commend it.—*Providence Evening Press.*

A chaty, sensible, profitable book.—*Cleveland Herald.*

The book gives much valuable information, and gives it in the pleasantest manner imaginable.—*Detroit Daily Union.*

DON'T FAIL TO HAVE A LIBRARY. GOOD BOOKS For Farmers' Libraries.

In response to a request made of one whose thorough and practical knowledge on all matters pertaining to the Farm, Garden, and Household is so fully conceded that his opinions could not fail to secure attention and command respect were we permitted to give his name, we have received the following as his judgment concerning some of the works on our Catalogue of Books for Farmers.

Any of these Books will be forwarded, post-paid, to any address in the United States or Territories, on receipt of the price, by Orange Judd Company, 245 Broadway, New York.

For a Farmer's Library.

How Crops Grow,

(price \$2.00), and

How Crops Feed,

(price \$2.00.)

By Prof. SAM'L W. JOHNSON.

If I could have but two books in such a library it would be these, as I consider them the most important contributions to agricultural literature of modern times. They contain all of vegetable physiology and agricultural chemistry that any except special students need, and nowhere is there so much of agriculture condensed in so small a space. As works of reference they are indispensable.

Most farming operations are accomplished by force, applied through implements and machines, and a farmer should understand mechanics, at least sufficiently to apply force most economically. In this work the fundamental principles are clearly taught, and their application illustrated.

This is the best American work upon general farm management. It treats of the leading crops, buildings, draining, etc., and includes sufficient about animals of different kinds to meet the wants of most farmers.

For the farmer who wishes to know something about the weeds upon his farm, as well as useful cultivated and wild plants, this will answer better than a general treatise on botany.

Such a library should have some work on domestic architecture. Most works upon the subject are costly on account of the designs. This is one of the best works, at a moderate price, and contains, with other matter, the method of building with concrete.

After the farm crops, fruit is of the most importance. No work covers the whole subject so completely as this.

Farms near cities often make more from garden crops than from farm crops. This is the best work on market gardening, and will serve for the family garden also.

An excellent garden book, and in the libraries for Southern farmers might be substituted for Henderson's, but it would be well to have both.

I do not know of any book upon out-door flower gardening that on the whole is so good as this. Its teachings are sound, and style pleasing.

Country and Suburban Homes.

By D. T. ATWOOD.

Price \$1.50.

The Fruit Garden.

By P. BARRY. Price \$2.50.

Gardening for Profit.

By PETER HENDERSON.

Price \$1.50.

Gardening for the South.

By WM. N. WHITE.

Price \$2.00.

The New Book of Flowers.

By JOSEPH BRECK.

Price \$1.75.

Mysteries of Bee-Keeping.

By M. QUINBY. Price \$1.50.

Practical Poultry-Keeper.

By L. WRIGHT. Price \$2.00.

The Pig.

By JOSEPH HARRIS.

Price \$1.50.

Draining for Profit.

By GEO. E. WARING, JR.

Price \$1.50.

Dairy Husbandry.

By X. A. WILLARD.

Price \$3.00.

Tim Bunker Papers.

Price \$1.50.

Bees, Poultry, and Pigs are often made subjects of especial care by small farmers, and separate treatises on these are more likely to be asked for in a library like this than those upon the larger animals. Each of these is the best in its line.

So in farm operations, those of Draining and Dairying, especially the factory system, are not likely to be treated sufficiently in detail in general works.

As all the other works are matters of fact, it may be well to have a little pleasantry. This conveys much sound teaching on rural economy in a quaint style, and it is sometimes policy to sugar-coat your pill.

Books for a Larger Library.

Besides all the works in the foregoing list, I would add the following:

American Cattle. L. F. ALLEN. \$2.50.

Randall's Sheep Husbandry. \$1.50.

Hints to Horse Keepers. H. W. HERBERT. \$1.75.

American Cattle Doctor. G. H. DADD. \$1.50.

Insects Injurious to Vegetation.

DR. HARRIS. \$4.00.

Fruits and Fruit Trees of America.

DOWNING. \$5.00.

Cranberry Culture. J. J. WHITE. \$1.25.

Grape Culturist. A. S. FULLER. \$1.50. (For the West would substitute Hensman's Grapes and Wine. \$1.50.)

Grasses and Forage Plants.

C. L. FLINT. \$2.50.

Forest Trees. ARTHUR BRYANT. \$1.50.

Landscape Gardening. KEMP. \$2.50.

Hops, 40 cts. **Flax,** 50 cts. **Tobacco,** 25 cts.

Onion, 20 cts. Essays.

Boussingault's Rural Economy. \$1.60.

Play and Profit in My Garden. ROE. \$1.50.

Window Gardening. WILLIAMS. \$1.50.

Books for a Still Larger Library.

In addition to those mentioned in the other two lists, I would name the following:

Animals and Plants under Domestication. 2 vols. CHAS. DARWIN. \$6. (This not suggested for its doctrine, but as a useful work of reference.)

Hussey's National Cottage Architecture. \$6.

Landscape Gardening. DOWNING. \$6.50.

The Vegetables of America. F. BURR. \$5.

The Book of Evergreens. J. HOOPES. \$3.

Front Culture. DR. SLACK. \$1.50.

Farm Gardening & Seed Growing. BRILL. \$1.

The Dog. DINKS, MAYHEW & HUTCHINSON. \$3.

Young Sportsman's Manual. FORRESTER. \$3.

Hunter and Trapper. H. THRASHER. \$1.

The Market Assistant. DEVOE. \$2.50.

Hedges and Evergreens. WARDER. \$1.50.

Pear Culture. P. T. QUINN. \$1.

Money in the Garden. QUINN. \$1.50.

How Plants Grow. GRAY. \$1.25.

How Plants Behave. GRAY. 75 cts.

Illustrated Horse Doctor. MAYHEW. \$3.

Peach Culture. FULTON. \$1.50.

Barns, Out-Buildings & Fences. HARNEY. \$6.

Cottages and Farm Houses. WOODWARD. \$1.50.

Country Homes. WOODWARD. \$1.50.

ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.

JUNE, 1874.

Woodward's Graperies and Horticultural Buildings.—Designs and Plans of Hot-Beds, Cold-Pits, Propagating Houses, Forcing Houses, Hot and Cold Graperies, Green Houses, Conservatories, Orchard Houses, etc., with the various modes of Ventilating and Heating. Post-paid, \$1.50.

Wheeler's Rural Homes.—Houses suited to Country Life. Post-paid, \$2.00.

Wheeler's Homes for the People.—100 Original Designs, with full Descriptions, and Constructive and Miscellaneous Details. Post-paid, \$3.00.

Harney's Barns, Out-Buildings, and Fences.—Containing Designs and Plans of Stables, Farm Barns, Out-Buildings, Gates, Gateways, Fences, Stable Fittings and Furniture, with nearly 200 Illustrations. Royal quarto. Post-paid, \$6.00.

Eveleth's School-house Architecture.—A new and original work, containing Seventeen Designs for School-houses, Sixty-seven Plates with Perspectives, Elevations, Plans, Sections, Details, Specifications all drawn to working scale, with methods of Heating and Ventilation. Large quarto. Post-paid, \$6.00.

Copley's Plain and Ornamental Alphabets.—Giving examples in all styles, together with Maps, Titles, Borders, Meridians, Ciphers, Monograms, Flourishes, etc., adapted for the practical use of Surveyors, Civil Engineers, Draughtsmen, Architects, Sign Painters, Schools, etc. Post-paid, \$3.00.

Play and Profit IN MY GARDEN.

By E. P. ROE,

Author of "Barriers Burned Away," etc.

NOTICES BY THE PRESS.

The author takes us to his garden on the rocky hill-side in the vicinity of West Point and shows us how out of it, after four years' experience, he evoked a profit of \$1,000, and did so while carrying on pastoral and literary labors. . . . It is very rare that so much literary taste and skill are matched to so much agricultural experience and practical good sense. —*Harper's Magazine*.

This book is as poetical as it is practical. Still he is no dreamer. He goes into every essential detail with as much minuteness and precision as if he were writing a manual for the practical farmer. Indeed few works professedly devoted to agriculture give more sound and valuable information on the secret of winning golden harvests from the soil than this brief idyllic sketch. —*N. Y. Tribune*.

A very charming book, not only by reason of its pleasant style, but for its quiet refined humor and fund of really useful information on the subject of gardening. —*Boston Gazette*.

It deserves to stand side by side with "My Summer in a Garden." —*Christian Register*.

A fresh, lively work. —*N. Y. Observer*.

One reads without weariness and learns much of practical value. —*Chicago Evening Journal*.

Full of information. Explains just what the reader wishes to know. We most heartily commend it. —*Providence Evening Press*.

A chatty, sensible, profitable book. —*Cleveland Herald*.

The book gives much valuable information, and gives it in the pleasantest manner imaginable. —*Detroit Daily Union*.

NEW SERIES—No. 329.

A PRIMITIVE MILL IN IRELAND.

One need not go to the Holy Land to find "two women" "grinding at a mill," as the ancient mill is still to be found among the Irish peasants. The mill consists of two stones about 22 inches in diameter, the lower being about an inch smaller than the upper. The upper face of the lower stone is convex, and has in its center a

strong pivot. The upper stone, which is concave on the lower side, to match the face of the lower stone, has a three-inch circular hole in its center; across this hole is fixed a strong piece of wood, which has upon its under side a hole extending part way through to serve as a socket for the pin in the lower stone. By

means of this cross-piece and the pin the two stones are kept together, and by placing bits of leather in the socket or hole in the cross-piece the two may be separated more or less as the meal is required to be coarser or finer. A handle is fixed on the upper stone. As in olden times, this mill requires two women to work it.

AMERICAN AGRICULTURIST.

NEW YORK, JUNE, 1874.

Every spring furnishes renewed evidence of the advantage of underdraining, and also, on many soils, of fall plowing. On our own farm we were able to sow oats and peas April 21st on sod plowed this spring. Barley we sowed April 25th. This is late sowing, but it is the best we could do, and if the land had not been underdrained it could not have been plowed and sowed for a week or ten days later. This often makes the difference between a good and a poor crop. We have had an unusually cold and backward spring. Winter wheat was much injured by freezing weather and cold winds in March and April. On wet land it has been badly winter-killed—or, more correctly, spring-killed. On many farms in our own vicinity not a furrow was plowed until the first of May. Farmers who can raise good crops this year will probably have no reason to regret the time and money they have spent in draining, cleaning, and enriching their farms or in improving their stock.

We hope and believe that we shall see no more 25-cent corn for some years. We shall hear little about "over production." The railroad magnates will learn that farmers will not long continue to raise crops and sell them at a loss. And farmers will learn that it is better to sell their hay and grain in the form of beef, pork, mutton, cheese, butter, and wool than to transport it long distances to market in the raw state. Clean land, larger crops per acre, better breeds of stock, and more liberal feeding are the fundamental planks in the American Agriculturist's platform. Here we have stood for years and here we now stand. We wish every farmer in the United States to join our party.

Hints about Work.

The Season is Late, and much land intended for spring grains has not been sown. Corn may still be Planted.—The small, early, northern varieties are the best for late planting. Put in all the Crops you can take good care of. They are likely to be wanted. Corn Planted by Hand may be soaked in warm, soft water for twenty-four to thirty-six hours. If

the land is moist, mellow, and warm, it will soon germinate and grow rapidly.

Pour the Soaked Corn and water on to a sieve, and after the water has drained off spread it out to dry for an hour or two, and then dust it over with plaster and stir it with the hand until every kernel is coated with plaster. This will not only make it easier to separate in dropping, but it will help the growth of the young plants. We have dropped soaked corn with a drill, but it is, of course, necessary to calculate for the increased size of the corn, and also to see that there is no clogging or crushing of the grain.

Corn for Fodder may be sown any time this month. You must have rich, dry, clean, and mellow land. If it can be avoided, never sow broadcast. Drill or drop in rows 2 1/2 to 3 feet apart, so that you can use a horse hoe to clean and mellow the land. Use plenty of seed, say from six to eight kernels to each foot in the row.

Beans are usually drilled or dropped in rows 2 1/2 feet apart. If dropped in hills a foot apart in the rows, put from four to six beans in each hill. This plan facilitates hoeing and pulling. If drilled in a continuous row use a little more seed, say eight or ten beans in a foot. Go over the field after the drill and see that all the beans are covered.

The Depth of Planting depends very much on the kind of soil and on its condition. On light soil seed may be put in deeper than on heavy soil. At this season it is necessary to plant deep enough to reach the moist earth, say from one to three inches deep.

Harrowing is rarely done as thoroughly as it should be. It is very important to make a fine, mellow seed-bed.

Rolling is also too much neglected. Roll and then harrow and then roll again until you have four or five inches of fine surface soil. Such a soil will attract and retain moisture.

Suedes Turnips or Ruta-bagas should be sown about the middle of the month or before. The soil should be made as fine and mellow as possible. Drill in rows 2 1/2 feet apart, using two to three pounds of seed per acre. The object of such thick seeding is to give some of the plants a chance to get ahead of the so-called turnip-fly or beetle. If possible, drill in with the seed two or three hundred pounds of superphosphate per acre, mixed with three or four times its bulk of sifted coal ashes. Thin out the plants when in the rough leaf to a foot apart in the rows. Do not neglect to roll the land immediately after sowing.

Mangel-Wurzel or Beets should now be ready to hoe. Thin out to fifteen inches apart. If it is necessary to transplant, be careful to dig up the plants with the hoe, and not pull them up out of the hard earth and thus strip off the soil and fine roots. In hoeing, do not cut too deep. In hoeing turnips, it will not hurt the plants to take away nearly all the soil from their roots; but this is not the case with mangels. The less the soil around the roots of the young plants is disturbed the better. Cultivate every week or ten days. You should have a narrow tooth horse hoe, so as not to throw the earth on to the young plants.

Fight the Weeds.—Fight them as you would fight a fire. Do not let them get beyond your control. Kill them while in the seed-leaf. On loose, mellow soil, a fine harrow, if used just as the weeds are breaking through the soil, will kill them by the million; but if delayed a few days in warm, growing weather it will have comparatively little effect.

Start the Cultivator the moment you can see the rows of corn, or potatoes, or mangels. The outside teeth of the cultivator should be bright, sharp, and as thin as possible consistent with the necessary strength, and they should be set so as to throw the earth towards the center of the row. With a good cultivator the soil may be stirred within an inch of the plants, and leave little necessity for hand hoeing.

Summer Fallows must not be neglected. In breaking up sod land use three horses abreast, and turn over a good furrow. Then roll, and afterwards

harrow thoroughly lengthwise of the furrows. In a week or so put on a two or three horse cultivator, and in a few days follow with a harrow and then cultivate again as soon as any weeds appear. Whether it is best to plow only once, or two or three times, is a disputed point. Whichever plan you adopt, let the work be done thoroughly. That plan is best, other things being equal, which causes the most weed seeds to germinate and then kills the plants.

Rainy Days can be turned to good account in getting ready for haying, in cleaning and white-washing cellars, in repairing broken tools and implements, and putting everything in order.

Hang Things up.—Do not throw plow-points, cultivator-teeth, wheels, coulters, harrow-teeth, chains and pieces of chain, rings, clevis, extra whippletrees, neck-yokes, etc., into some dark and dusty corner, but put some wire round them and hang them up where they can be seen.

Grind Hoes, and keep them constantly bright and sharp. Spades also, and if you have a power grindstone it will pay well to grind coulters, cultivator-teeth, and plow-points.

Clover should be cut for hay as soon as the earliest blossoms begin to get brown. There can be no doubt that early cut hay is more nutritious, or at any rate more readily digested, than when the grass or clover is allowed to get ripe.

Timothy and other grass, if intended for consumption on the farm, should also be cut early. If to be sold for city horses, you will get more hay, and a better price, by letting it grow until the seed is beginning to form.

In Curing Clover Hay, our own plan is to start the machines in the afternoon and keep cutting until dark. Dew or rain will not hurt grass while it is green. The next morning, after the dew is off, rake the partially dried grass into small windrows with a steel rake. Turn them immediately after dinner, and towards night rake into larger windrows and put into cock. Turn or spread out the cocks the next morning, and draw in the hay in the afternoon.

Milk Cows should now furnish a full pail of rich milk. See that they have access to plenty of fresh water. Unless the grass is unusually rich, from one to two pints of corn-meal stirred in a pail of water and given twice a day will often prove profitable.

Calves and young stock should have the best of pasture and more or less corn-meal soaked in water or cooked. The quantity will depend on the age and other circumstances. As a rule, from half a pound of meal to one pound for each 100 lbs. of live weight will not be over-feeding.

Sheep.—The above rule will apply to sheep. The English farmers find it profitable to give grain or oilcake to their fattening sheep and lambs even when running in rich pastures.

Ewes and Lambs should have good pasture and access to water. The lambs will pay well for a little grain fed in an inclosure separate from the ewes. For scours, change the pasture and let the sheep have what hay they will eat.

In Washing Sheep, be careful to keep the nose and mouth of the sheep out of the water. Tag the sheep before washing.

Lambs should be dipped in a solution of carbolic soap to kill ticks. Repeat in two or three weeks.

Swine should have access to fresh water and the run of a good clover or grass pasture. Let them have coal or wood ashes, salt, sulphur, and charcoal—all they will eat.

Young Pigs are unusually scarce, and pork is likely to bring good prices. Feed liberally. Give the young pigs all the milk. The old ones can get along without it. The secret of producing good and cheap pork is to get an improved breed and feed liberally, especially while the pigs are young.

Nothing will Pay Better than to cross common sows with a thorough-bred boar of a well-established and highly improved breed, such as the Essex, Suffolk, or Berkshire. Now is the best time

to order a young, two months' old boar. He will be ready for moderate use next fall and winter.

Work in the Horticultural Departments.

June will bring its abundance of fruits and flowers; strawberries, raspberries, currants, and other small fruits will follow each other in quick succession; the early vegetables should also yield an abundant supply. Weeds will grow rapidly in the now warm soil, and should be destroyed as soon as they appear. Some crops may have failed owing to too early sowing or too wet weather; all such should be replanted at once before it is too late. In a favorable season seeds will germinate very rapidly, and it is not too late to sow and expect a fair crop of most things. Succession crops ought to be sown all the season; corn if sown every two weeks, even until July, will generally pay, for if it fails to produce a crop of ears the fodder is the best possible food for cows.

Orchard and Nursery.

Trees set out this spring will need attention, to see that they acquire proper shape. Where buds appear which are not needed for branches rub them off. Do not allow the trees to be displaced by the wind; to prevent this, two or three large stones placed around the roots are better than stakes for keeping them in place. See that the trees have open heads; low heads are better than high ones.

Grafts set last month will require attention. Remove shoots which start on the stock, so that all the nourishment may be given to the graft. If two cions have been put on the same branch, remove the smaller if there is danger from crowding.

Budded Stocks.—Sometimes the shoot from the bud is so vigorous that the newly formed wood is not strong enough to withstand the winds; when this is the case they should be staked.

Pruning.—June, by most orchardists, is considered the best month in which to prune, especially where large limbs are to be removed. Cover the wounds with liquid grafting-wax, paint, or other protection to prevent decay.

Orchards containing young trees should be cultivated in such a manner as to keep the soil mellow; this may be done by planting crops between the rows, to which plenty of manure is given.

Thinning can hardly be too severely practiced upon young trees, and older ones are greatly benefited if half or more of the fruit is removed. The quality of the remaining fruit will be enough improved to repay the trouble. Thinning will give a crop of fruit every year.

Seed-Beds of evergreen and deciduous trees will need shading with screens of lattice-work or evergreen boughs. The shading must be so arranged that air can circulate freely around the plants.

Insects.—He who would have good fruit as well as healthy trees must keep a sharp lookout for every species of injurious insect. Caterpillars of all kinds will have to be looked after sharply. Another very destructive insect is the

Borer.—The parent deposits the eggs near the base of the tree, where they are hatched, and the young borers work themselves into the tree. To prevent this, wrap a piece of thick paper around the tree, the lower edge of which should be below the surface of the soil.

Slugs appear on the leaves of the pear and cherry, and are small, green, and slimy. Lime or ashes dusted over will destroy them.

Fruit Garden.

Strawberries.—If not mulched before this, attend to it at once. Any material which will keep the fruit from being soiled will do. If the crop is to be marketed, provide plenty of baskets and crates for shipping.

Blackberries.—Do not allow the new canes to

grow over five feet; when they reach this height pinch off the end. This will induce the growth of side branches; these ought to be stopped when they reach a length of eighteen inches.

Raspberries.—Four new canes to a stool are enough, unless more are wanted for planting. A good plan for training is to tie the canes to a wire stretched along the row, and attached at each end to a firmly-set post.

Currants.—Apply a heavy mulch of litter to keep the weeds down as well as to keep the ground moist. Give the bushes a dusting with powdered white hellebore if attacked by borers.

Grape-Vines.—If vigorous, healthy vines are wanted, do not allow but one shoot to grow the first season after planting. Rub off all other shoots, and keep this one tied to a stake during the season. Young vines should not be allowed to overbear; two bunches to a shoot are enough. For training older vines there have been recommended a great many plans. Any may be adopted which keep up a supply of bearing wood down near the ground.

Insects will be troublesome here as well as in the orchard, and should be carefully looked after, and the larger beetles and caterpillars removed by hand-picking.

Kitchen Garden.

Work will be lively here from the constant hoeing and cultivating required to keep the weeds under subjection.

Hoe and Rake.—These are both necessary implements in the garden, and should be kept sharp. The wheel-hoe described in a former number of the *Agriculturist* is a great improvement over the old form; with this a man will do twice as much work and do it better than with a common hoe. The bayonet hoe or its improvement, the lance-head hoe, are very useful in weeding and thinning out the rows of carrots, parsnips, etc.

Seeds of many things can be sown now and with the prospect of a good crop. Beets sown now will make a rapid growth, and even until the first of July the prospect of a crop is good.

Asparagus.—Do not cut after the peas are plenty. Hoe over the bed occasionally to keep down the weeds, and if there is well-rotted manure to be had apply now.

Beans.—Continue to plant the bush sorts for late snaps.

Beets.—Keep the early sorts well hoed, and thin as soon as large enough to handle. The thinnings make good "greens." Sow early sorts now for succession.

Cabbage.—Transplant the early and medium sorts from the seed beds and sow for late. The cold-frame and very early hot-bed plants will now be fit for the table or for market. When the early crop is harvested the land should be plowed and manured for other crops.

Carrots.—It is not yet too late to sow, but it should be done at once. Keep the young plants free from weeds.

Celery.—Young plants in the seed-bed should not be crowded or allowed to become weedy.

Corn.—Sow every two weeks for a succession; later in the season sow only the early sorts, as the others will not have time to grow.

Cucumbers.—Prepare well-manured hills four feet apart each way, and use plenty of seed, and manure in the hill. There are many devices for keeping off the "striped bug," but some simple covering answers.

Egg-Plants require a rich soil, and should not be planted until the ground is warm and dry. The "green-worm" which attacks the tomato also preys upon the egg-plant; the only remedy is hand-picking.

Endive.—Transplant and sow seeds for late crop. *Lettuce* seldom does well in summer unless planted in a shady, moist place.

Melons need the same care as cucumbers, except

that they should be planted from four to eight feet apart according to the variety.

Onions require careful attention to prevent the growth of weeds. If there is a near market they are usually more profitable when green and half grown than if allowed to ripen.

Pursnips need to be hoed often, or until the leaves cover the ground.

Peas.—Plant for a succession, taking care to cover deeply. Give brush to all that need it.

Rhubarb.—The flower-stalks should be removed as soon as they appear. When fruit comes stop cutting and give the plants rest.

Ruta-Bagas may be sown the last of this month. Dust on ashes or plaster as soon as up to keep off insects.

Salsify.—Keep the plants hoed and the ground loose and mellow. Seed may be sown at once, but the roots will not be so large as if planted earlier.

Spinach goes to seed so quickly during summer that it is of but little use to sow now. New Zealand is best suited for hot weather.

Squashes.—Plant the same as cucumbers; the bush sorts three to four feet apart, and the large-growing winter sorts eight feet.

Sweet-Potatoes.—The first week in June is early enough to plant at the North. Set out the plants, 12 or 15 inches apart, on well-manured ridges.

Tomatoes.—Set out plants and keep well hoed. Provide some support in the shape of brush or trellis; this will allow the fruit to ripen, and also prevent it from becoming soiled by the earth.

Flower Garden and Lawn.

Lawns.—In order to obtain a velvety surface, the lawn should be cut frequently. For this purpose a lawn-mower is needed, as it leaves the lawn with a smooth surface, and not ridged as when mowed with a scythe.

Annuals may be sown in the open ground now that it is well warmed. Transplant such as require it, and weed those already sown.

Bedding Plants should be planted out in the borders where the practice of massing is followed.

Specimen Plants from the greenhouse are often used to ornament the grounds with good effect. Oranges, Oleanders, Palms, and any other subtropical plants are useful for this purpose.

Fuchsias.—Do not plant in the open ground unless there is some shady spot for them.

Bulbs.—Hyacinths, and other fall bulbs should be taken up as soon as the leaves begin to decay. Tuberoses started under glass may be set in a warm spot. Plant out Cannas, Gladioluses, and Caladiums in beds on the lawn or in the borders.

Climbers, whether woody or herbaceous, should be provided with stakes or trellises.

Weeds will grow rapidly here as well as in the vegetable garden, and care must be taken to keep them down.

Greenhouse and Window Plants.

Do not remove all the plants from the greenhouse during the summer; enough should be left to make good show during the season. Make all necessary repairs now before the house is needed for the plants in the fall. Shade will be needed, and should be given either by whitewashing the glass on the outside or by means of screens.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, from our daily record during the year, show at a glance the transactions for the month ending May 13th, 1874, and for the corresponding month last year:

Table with columns: RECEIPTS, Flour, Wheat, Corn, Rye, Barley, Oats, and SALES, Flour, Wheat, Corn, Rye, Barley, Oats. Rows show data for 25 days ending May 13th, 1874, and 24 days ending May 13th, 1873.

Table 2: Comparison with same period at this time last year. Columns: RECEIPTS, Flour, Wheat, Corn, Rye, Barley, Oats. Rows show data for 25 days ending May 13th, 1874, and 25 days ending May 13th, 1873.

Table 3: Stock of grain in store at New York. Columns: Wheat, Corn, Rye, Barley, Oats, Mill. Rows show data for May 11, 1874, and previous dates from April 6 to Dec 10, 1873.

Table 4: Exports from New York, Jan. 1 to May 9. Columns: Flour, Wheat, Corn, Rye, Barley, Oats. Rows show data for 1874 and 1873.

CURRENT WHOLESALE PRICES.

Large table of current wholesale prices for various commodities including Flour, Wheat, Corn, Rye, Barley, Oats, Beans, Peas, and various oils and fats. Columns include item names and prices for different grades and quantities.

Gold has been up to 114 1/2 and down to 111 1/2—closing May 12th at 112 1/2 as against 113 1/2 on April 11th. With the resumption of inland navigation comes the promise of renewed activity in the wholesale produce line. The earliest receipts from the Canal have come to hand within a few days, and have made liberal and much needed additions to the available supplies, especially Breadstuffs. The demand has been fairly active, in good part for export. The distribution of stock has seriously diminished the amount remaining in store at this point. The high range of ocean freights has been against the export business. Prices of Flour and Grain closed lower. Cotton has been more active, for both prompt and forward delivery, at advanced figures. Provisions have been quite freely dealt in, particularly Pork and Lard, which closed higher, on a lively speculative inquiry. Tobacco, Hay, and the better grades of Hops have been selling moderately within our range. A more active business has been noted in Wool. Manufacturers have been making more liberal purchases,

chiefly to provide for immediate wants, while the trade inquiry has been moderate. Prices have shown firmness on really desirable grades of stock, which have been offered sparingly. Little new clip, comparatively, has as yet reached this market, but considerable receipts of California by rail are looked for soon. Included in the recent sales in the local market were: Domestic Fleeced at from 48c. @ 55c.; Georgia at 25c.; Unwashed stock at 30c. @ 40c.; Washed at 35c.; Scoured at 55c. @ 58c., chiefly at 55c. @ 70c.; Combing at 50c. @ 65c.; Domestic Puled at 25c. @ 50c.; Lambs at 26c. @ 30c.; Texas at 18c. @ 32c.; California Fall at 18c. @ 26c.; 17,000 lbs. New California Spring Clip, at 23c. @ 32c.; and 17,000 lbs. Noils, part domestic, at 47c. @ 50c. At Boston considerable sales have been reported of new clip California Spring at 31 1/2 @ 36c., the latter rate for fancy lots. In most other commodities trade has been comparatively tame.

New York Live-Stock Markets.

Table of receipts for various live stock including Beef Cattle, Sheep, Swine, and Horses. Columns: WEEK ENDING, Receipts, and various stock types.

Beef Cattle.—The month's business closes unfavorably for sellers, after a brisk trade, at gradually rising prices during the previous three weeks. Freighters are now less than 40c. a hundred from Chicago to New York, and consumers look for a share of the advantage. If freight were just nothing, it is a question if farmers or graziers would reap a cent's worth of advantage, and if the consumers whose needs really make the markets would not get the profit. As it is, prices in the West are just now too high for dealers to make money at current rates here, and as we close our report they are losing \$2 to \$5 a head on every beast sold. The market is down at least 1/2 c. @ 1/2 c. per lb. since May 4th, and this does not show all the loss, as the estimates are also against the seller, and a good many head, at least 25 carloads, go over unsold. Poor native steers to dress 55 lbs. to the gross cwt. sold at the close at 9 1/2 c. per lb., and the best at 12 1/2 c. to dress 55 lbs. Fair Texans at 10c. @ 11c., and fat bulls at 5 1/2 @ 5 1/2 c. per lb.

The prices for the past four weeks were as follows: WEEK ENDING, Range, Large Sales, Average. April 20, 9 @ 13 c., 10 1/2 @ 11 1/2 c., 10 1/2 c. April 27, 8 1/2 @ 13 c., 10 1/2 @ 11 c., 10 1/2 c. May 4, 9 1/2 @ 13 c., 11 @ 11 1/2 c., 11 1/2 c. May 11, 9 1/2 @ 12 1/2 c., 10 1/2 @ 11 1/2 c., 11 c.

Milk Cows.—In this class of stock there has been a steady business at fair prices. All that have been offered were taken readily, and dealers report a fair demand, at \$40 to \$80 per head for cow and calf. Really choice family cows have sold at \$90 to \$100 per head.

Calves.—The unwholesome practice of shipping "bobs" at the tender age of ten days only demoralizes the market for veals. Hundreds of these "bobs" are allowed to come on the market under the noses of the inspectors, and prices are run down in consequence. The market is weak under the pressure, and 4c. @ 7c. is all that is quoted for poor to prime veals.

Sheep and Lambs.—Clipped sheep are now coming in, and have met with an active demand until the last week, when an increased supply and a weak market meeting prices went down and some sheep went over unsold. For prime shorn sheep 7 1/2 c. @ 8 1/2 c. is quoted at the close, and for unshorn 8c. @ 9 1/2 c. Good lambs are selling as we write for 11 1/2 c. @ 12 1/2 c. per lb. Swine.—Live hogs have been without animation throughout the month, and close dull at 5 1/2 c. @ 5 3/4 c. per lb. Dressed hogs have been active, but close easier at 7 1/2 c. per lb.

Preparing Poultry for Market.

A gentleman in Maine reports that he followed the directions for preparing poultry given in the Agriculturist for November last, and that in the Portland and other neighboring markets his poultry brought him several cents a pound less than it should have done had he not scalded it. At the head of the directions it was stated that they were for the New York market, and we did not expect them to apply to any other. In the matter of poultry especially, the customs in the markets of cities vary greatly, and to bring the best prices the poultry must be dressed according to the customs and prejudices prevailing at the place where it is to be sold. For example: poultry that is not drawn will not meet with a ready sale in Boston, Providence, or other New England cities, while drawn poultry in New York is likely to spoil on the hands of the dealers. Each one should make himself acquainted with the requirements of the market to which he proposes to send produce of any kind.

The ORANGE JUDD COMPANY,

PUBLISHERS,

245 Broadway, New York.

Officers { ORANGE JUDD, President,
and Chief { C. C. NORTH, Vice-President,
Proprietors: { SAMUEL BURNHAM, Secretary.

* Messrs. L. A. CHASE and A. P. MILLER, being engaged in other business pursuits, have retired from official connection with the ORANGE JUDD COMPANY.

LAST CALL ON THE GENERAL LIST OF PREMIUMS For 1874. ONE MONTH MORE.

One Month—June—yet remains, during which any person who wishes to obtain one or more of the useful and valuable articles offered in our Premium List (of which a copy will be sent free to any applicant, see page 239) can easily get them. This has already been done by more than 14,000 persons, who during years past have tried with success the raising of Clubs of Subscribers for our papers, and availed themselves of the liberal offers of Premiums made by the Publishers.

We invite all our Subscribers to take hold of this work and secure a Premium while the offer is open. Specimen copies of our papers will be sent to any wishing to show them for this purpose.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money:—Checks on New York City Banks or Bankers are best for large sums; make payable to the order of Orange Judd Company. Post-Office Money Orders for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

Postage: On *American Agriculturist*, 12 cents a year, and on *Hearth and Home*, 20 cents a year, in advance. Double rates if not paid in advance at the office where the papers are received. For subscribers in British America, the postage, as above, must be sent to this office, with the subscription, for prepayment here. Also 20 cents for delivery of *Hearth and Home* and 12 cents for delivery of *American Agriculturist* in New York City.

Bound Copies of Volume Thirty-two are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the last seventeen volumes (16 to 32) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Vick's Premiums.—Our friend Vick is one of the irrepresibles. This time he offers liberal premiums for the best exhibition made at any state fair this fall, of flowers raised from seeds purchased from him. Those interested can obtain circular of particulars by addressing James Vick, Rochester, N. Y.

Mr. Orange Judd, whom the papers all over the country have had as likely not to live to get home, or as the last account had it, was dying at Geneva, quietly walked into the office on April 25th, looking very much unlike one in the condition these papers had repre-

sented him. Mr. Judd had not been in a satisfactory state of health since the severe illness which overtook him while on the United States Sanitary Commission in 1864, and last summer he quietly slipped off to European search of complete rest. His many friends will be glad to learn that he returns looking as if he had taken a new lease of health and had no present idea of going on the retired list.—Ed.

The Centennial Gazetteer of the United States.—A gazetteer for this country only is a thing that has long been wanted, and in one by Gen. A. von Steinwehr, and just published by Ziegler & Mc Curdy, Philadelphia, we have a compact and comprehensive one. A work of this kind can only be properly judged after an extended acquaintance, and we base our good opinion of this from a long acquaintance with the author, whom we have known in the field as a most excellent topographer, and out of it as an enthusiastic geographer. During the few weeks that we have had the volume it has been in frequent use, and in no case has it failed us for even the most obscure places. It is based upon the last census, the post-office department records, and all the official sources of statistical information. Each state and territory has a very exact description of its physical features drawn from the most recent surveys, and the work can not fail of being of great assistance to those who are looking westward. The statistics of counties are also very useful. We congratulate the author on having made a valuable addition to our handy books of reference.

The Cable Screw Wire Shoes.—"J. W.," Lancaster Co., Pa. Durability and comfort in wear the shoes and boots made with the cable screw wire will be found superior to those made with wooden pegs, as the wire is forced through the leather and riveted by machine in such a way that they can not shrink and work loose. No water can enter these shoes, and they will not come apart. For the rough work necessary upon the farm this is a great advantage. The address of the makers is the Cable Screw Wire Company, Boston.

No More Advice.—Mr. Fred. Mather, of Honeoye Falls, N. Y., whose communications on fish culture we have sometimes published, is quite tired of answering letters asking advice, and wishes us to say so to our readers. He says: "Circumstances vary so much—soil, flow, temperature, material, and objects of the owner—that justice to myself demands that I should not risk my reputation in giving advice by mail. As I am engaged to the U. S. Fish Commission for the next season, I can recommend parties to employ an expert, and thus avoid expensive mistakes."

The Japan Pea.—"Jap" writes: "When properly cooked, they are very palatable to persons who are fond of beans or peas, for the taste resembles a mixture of navy beans and lady peas cooked together. To cook them: Put in soak overnight in warm water; then boil them, taking care not to add cold water, grease, or salt. When done, mash, season to suit taste, and bake."

Sawdust as a Mulch.—"J. C. C.," Washington, Ind. If your sawdust is, as you say, "thoroughly rotted," it will be an excellent mulch around your trees. Fresh sawdust is objectionable around young trees, as it forms a bed for the growth of fungi, which are said upon good authority to injure the tree. If the sawdust is considerably decomposed, it might be a better use of it to compost it with lime and use it as a fertilizer rather than as a mulch.

A Remedy for Looseness.—"J. W. B.," Bay River, S. C. In a case of looseness of the bowels in a horse we would give half an ounce of prepared chalk and half an ounce of ground ginger in the feed once a day. As indigestion is probably the cause, the feed should be carefully selected, and what grain is given should be ground. An ounce of salt should also be given in the feed daily.

Cabbage Worms.—"W. N. B.," Pa. We can not recommend any "certain" remedy for the cabbage caterpillar, by that meaning the now troublesome larvae of *Pieris rapae*. The butterflies, white with black spots on their wings, appear with the first warm day, and in early morning are easily caught with a sweep-net. Every female killed will prevent the birth of many "worms." Any application to the caterpillars must be made while they are very young, as they soon hide themselves and are sheltered by the central leaves. Salt, guano, etc., must touch the caterpillar to be of any service. When the butterflies are seen about, the eggs and young caterpillars should be searched for. It is very fortunate that this pest disappears as suddenly as it comes; it probably has several natural enemies; at all events a lo-

cality will be devastated by them one year and quite free from them the next.

SUNDRY HUMBUGS have been like the season, "very backward in coming forward," yet still they are not by any means dead. When one is killed we never know that it is dead. A well-known American quadruped which is fond of prowling around poultry yards is easily shot, but that is by no means the last of him—he leaves a fragrant memory for weeks and weeks. It is so with these humbugs, even after the law has put its quietus upon them, their scented trail extends far and wide. The law effectively squelched a most barefaced project of a "Library Concert," which so misappropriated the pleasant name of Magnolia, yet its all-pervading scent comes to us in the form of letters from far-off places. The industry with which the managers of this swindle worked is something remarkable, and they seem to have aimed at the most distant territories. One gentleman in Dakotah writes that they were especially busy there. The latest of these gift concerts comes, of all places in the world, from Utah, and is the

FIRST GREAT SALT LAKE GIFT CONCERT,

which is to be drawn on the 4th of July next, all for the benefit of the "Public Free School, the only free school in Utah." Then such a flashy programme, and the big figures, \$26,500.00 to be distributed, has a look quite as large and lively as that Kentucky scheme. Now this town of Corinne had at the last census, 1870, just 783 population. Corinne, for a small town, you make a great blow. Asking the people to buy 500,000 of your tickets at \$1 each in order that you may have "the only Free School in Utah" is equal to anything in the way of bombast we have seen. . . . Chicago claims to be the metropolis of the West, and has of course her metropolitan luxuries; one of her chief ornaments just now is the firm of

HOWARD & CO.,

who profess to import and manufacture watches, jewelry, and silverware. Whether this is the same Howard & Co. who a few months ago flourished in Philadelphia on the \$4 Geneva watch dodge, we are not aware. But they must be mighty nice people to send a school-boy a bill of \$20.25 for repairing a hunting, stem-winding, gold chronometer, with the following letter:

"Dear Sir: The watch received from you January 15th is now ready for delivery. You were correct when you stated it could not be repaired outside of our house. We have had great difficulty with it, but it is now in thorough order, and we will warrant it to keep correct time for five years. You wrote that the watch was found, and desire to know its worth. It is a very valuable time-piece, and must have cost at least \$500 in gold. It is now worth \$400, in gold, and for any one desiring a reliable time-keeper is really cheap at first cost. Please remit amount of bill by express, and the watch will be immediately forwarded. Respectfully,

HOWARD & Co."

That is a very pretty trick, Messrs. Howard & Co., but, unfortunately it is an old one. The Minnesota boy, to whom you sent it, is one of the kind who reads the *Agriculturist*, and no doubt had a good laugh at your expense. But doesn't it look mean, though, when you see it in print. You will probably catch many boys and men who (think they) can not afford to take this journal, and in their simplicity will forward the "\$20.25," hoping to get somebody's \$400 watch. The \$20 would pay for the *Agriculturist* 20 years, or for 20 copies a whole year. The "Howard & Co." here referred to must not be confounded with the worthy and reputable house of Howard & Co., New York City.

THE \$5 SEWING MACHINE

offered last month on favorable terms still remains on hand. Now that Barnum has returned we may get rid of it, for we are quite sure that he saw not its equal in Europe. We advise all persons to be exceedingly cautious of any cheap sewing machines advertised from Greenwich or Canal streets. These places, though carried on under different and changeable names, are equally obscure, and from the numerous complaints we have of persons who have sent money and received no return are equally suspicious. We can not conceive how any person can be so inconsiderate as to send money to a person for whose honesty they have no assurance, for a machine not advertised through the regular channels. *Moral:* Let all doubtful sewing machines severely alone. One lately advertised from Greenwich st., and one Mulligan from Greenwich or Canal, just as it pleases. This Canal st. cirenar has a flaming heading of "Steam Iron Works" and all that; but upon going to look him up at his number, we found no exterior sign, and only found where his room was by inquiring in a hair-dresser's shop on the lower floor. Whatever else may be done by M., he does not waste money on signs.

VILE LITERATURE

seems to have taken a fresh start. We include under this head not only offers of books, that are actually ob-

scene, but those works which propose to teach impossibilities. If the American Book Co., Manchester, N. H., and the Central Book Co., Garrettsville, O., are not engaged in a business which should induce the authorities in those towns to shut them up as nuisances, then they should not send out the circulars they do. Strictly speaking, it is just as much a fraud to get money by inducing a person to think that the books offered are bad ones, as in any other way. The circulars of both these concerns are vile in the extreme. . . . In the same category we place the Central Book Co., Ashland, Mass., with its offer of a book to teach the making of "love powders" and all such nonsense. . . . And equally rascally is the circular of Willis & Co., of Williamsburgh, N. Y. What fools these Willis & Co. are. They propose to sell a book with all sorts of secrets—upon one of which "many men have retired with a large fortune." These chaps say, with equal disregard of grammar and truth: "My arrangements with the post-office are such as that if you address correctly it is impossible money to be lost." The very contents of their circular show that they are by law shut out from the use of the post-office altogether. . . . There is a so-called publishing concern in Springfield, Mass., about which an amount of unpleasant evidence is accumulating.

THE HOTEL DODGE

has at last turned up again. We had supposed that had gone off with old "sands of life," but here it is as bright and blooming as ever. Perhaps some of our newer readers do not know this stale old trick. This time it is "Respy" E. Callinwater, who keeps a hotel, which it is the Arcade, in New York, of course, and on the "European plan." An unfortunate citizen, A. E. Clements, stopped at said hotel, but in two days he up and died, probably on the "European plan." No wonder he died, for he must have eaten and drank fearfully, as his bill for two days at this Arcadian place amounted to \$11.75. Fortunately the defunct left a trunk, which Callinwater opened, and found "a fine gold watch, two silver-mounted revolvers, gold ring, clothing," etc. But more than these—he found a paper addressed to another Clements away down in Georgia. Happy thought for Callinwater! He writes to the Georgia Clements, telling him that the trunk is valuable, and he is the proper person to have it, which he can do by forwarding to Cal. the amount of \$11.75, due by the defunct Clem. The Georgia Clem. doesn't bite worth a cent, but writes us to sell the pistols and pay Cal., and send on the "rest of the estate." He desires to express his grief for the loss of his relative, but particularly wants that trunk. We should just like to know what Cal. did with the body of the deceased Clem. Did he dispose of that "on the European plan?" It appears that here is a case for the coroner to look after, as people who leave gold watches and such things around don't generally get buried for nothing in New York. It may be that the new cremation society has got hold of his body and incinerated it as an experiment, and the unfortunate is now only a small handful of ashes.

WHAT IS THE C. O. D. SUPPLY CO?

After the inglorious ending of the Union Furnishing Store at Chicago we should think that this "C. O. D." business would rest awhile, but it has started anew, and the circulars and plans are so like the old that it looks "much of a muchness." To the lady in S. C., and other inquirers, we give the advice not to meddle with any machinery you know nothing about. Such persons as Stewart and Lord & Taylor do not need any machinery of order slips and tickets and such "gumgoolery" to do their immense business. If these "C. O. D." chaps are doing a straightforward business, why don't they do it in a straightforward way? The boy knew the hole the woodchuck went in at, but couldn't tell which one he'd come out at. And so we fear it will be with money that goes in to any of these dubious enterprises.

MEDICAL HUMBUGS

present few new features. One person writes to ask our opinion of "Uncle Ber Joe's Bell Tongue Syrup." We disposed of "Old Uncle" months ago. The strangest part is that any one should ask our opinion about any quack medicine whatever. All these things that are advertised are useless or worse, and the chaps who advertise them are quacks or worse. So with eye-cups and ear drums. It is of no use to ask us if the advertisers of these are reliable men. We neither know nor care. If any one wishes to tinker with his own eyes or ears, about the internal structure of which he knows nothing, he will not do it with any aid of ours.

Seed Potatoes.—"S. T.," Marion, Ind.

We have raised the largest crop of potatoes when we cut the seed to single eyes and planted two sets to a hill, hills (for Early Rose) thirty inches apart. The plan, however, will not answer so well for all kinds. The Peachblow cut in the same way has yielded with us very much less than with two sets of three eyes each in a hill.

We have frequently planted sets cut from very small potatoes without finding any difference between the yield and that from sets from large potatoes. But when the small potatoes have been planted whole and not cut as the others were, the yield has not been so good. Nevertheless we would always prefer to plant seed from fair-sized, well-formed, perfect potatoes. Liquid manure may usefully be applied while the crop is young.

Homesteads.—"Wallie." A soldier may take a homestead of 160 acres within the limits of a railroad grant, or ten miles upon each side of the road, but any other citizen may only take eighty acres within it. He may, however, take 160 acres outside of the grant, while a soldier can take no more anywhere. The fees for homesteading are \$14. Any person may pre-empt or purchase not more than 160 acres anywhere, but within a railroad grant the price is \$2.50 per acre or double what it is outside of it.

Spelt.—"J. A. M.," New Ulm, Minn. Spelt (*Triticum spelta*) is not wheat, although it belongs to the same botanical genus. It is an inferior grain weighing only thirty-six to forty pounds to the bushel, and because it thrives upon soil where wheat will not it is grown in some of those European countries where the agriculture is somewhat backward. The reason it is not grown here is because there is no demand for it in the grain markets, and if a crop were raised it is doubtful whether or not it could be disposed of. Rye would be a more profitable crop upon soils where wheat would not succeed. But instead of looking for crops suitable for poor land, it would be wiser to improve the soil and raise the best crops possible. There are spring and fall varieties of spelt as there are of wheat or rye.

Poland China Hogs.—"J. D.," Middletown, Del. The Poland China hogs are a large breed best suited to the Western states or in places where rapid growth and large size upon abundant food is desired. On reference to the advertising columns the names of breeders from whom they can be procured will be found.

Sycamore Timber.—"Subscriber," West Va. The wood of the sycamore tree (*Platanus occidentalis*) is better fitted for furniture or other purposes in which it is used in-doors and is not exposed to the weather than for out-door use. By exposure to the weather it twists and warps very much. It is not a durable timber when exposed to damp, as when buried in the ground for drains. The cucumber tree (*Magnolia acuminata*) would furnish much more durable timber for drains, and the chestnut or chestnut oak and white oak would be far better for fence posts, boards, or palings.

Excelsior Lawn Mower.—"Subscriber," Woodbury, N. J. A lawn can not be kept smooth and neat without the use of a good lawn mower with roller attached. The machine referred to is an excellent one, and has the gearing all inclosed so that it can not clog with the cut grass. It is made by the Chadborn & Coldwell Manufacturing Company, Newburgh, N. Y.

The Gardener's Monthly still remains a puzzle to us; its course is quite beyond our comprehension. In its March number it made a statement in regard to the *Agriculturist* that was so wrong that we felt called upon to set it right, and supposed we had done so in a pleasant manner in our paper for April. To this article the Gardener's Monthly for May makes the following rejoinder, which is as far out of the way as its original statement, and while we have no disposition to continue a discussion which our cotemporary is disposed to treat as if it were a quarrel, it is only just to ourselves that we deny those things of which it wrongly, and we are quite sure mistakenly, accuses us. The following is the Monthly's article:

Boussingaultia Lachauxii—The *American Agriculturist* devotes a column and a half of small type to abuse of the Gardener's Monthly. (1) For pointing out the fact that what the *Agriculturist* Company, in a recent issue of a "list of wood-cuts for sale," calls *Boussingaultia Lachauxii* is nothing but *Tulium patens*. (2) It acknowledges that we are right in the correction; but says that Donald G. Mitchell made the mistake first in the *HEARTH AND HOME*. (3) It elegantly says that Mr. Mitchell can settle this with the "G. M., which may mean either Grand Mogul or Gardener's Monthly," which ever the reader pleases. (4) It is not clear to us why a mistake which "originated in the *HEARTH AND HOME*" (3) should be continued in a catalogue of Orange Judd & Co. years after Donald G. Mitchell's time; and only that we deprecate the use of abusive language in the discussion of such innocent questions (5) as these, we might, slightly altering our cotemporary's expression, say that "Mr. Mitchell can settle this with the A. A., which may mean Arrant Ass or *American Agriculturist*." (7)

To this we reply: 1. We are quite surprised that the Monthly should look upon our article as "abuse." We too well appreciate the good work that journal has done and is doing, and have too high a personal regard for its

editor to treat it to anything like abuse. We totally disclaim in the article referred to any other feeling than that of the greatest kindness and good-nature. It placed us upon record as having said something which we did not say, trusting to an impression rather than positive knowledge. We acquitted it of all wrong intent, and we refuse to be considered as abusive. . . . 2. There is not, to our knowledge, any such organization as the "Agriculturist Company." The Orange Judd Company did issue a list of wood-cuts for sale, and the name *Boussingaultia Lachauxii* does not occur in it. This is a simple difference as to a fact, and we trust that this statement may not be regarded as "abuse." . . . 3. We are at loss to see how our language could be construed to read thus. "We did not say it. . . . 4. This is put in quotation marks as our language. We did not say so. It is an error of quotation. As the gravamen of our article seems to be in what was intended to be a playful use of the initials, which we supposed the editor would laugh at, we unqualifiedly retract the expression "Great Mogul," and, if it will better satisfy it, will say that it is in no sense either "Mogul" or "Great." . . . 5. Here is another quotation, but no such words occur in our article. It is safer not to quote from memory. . . . 6. We agree that it is an innocent question, yet it is a question of fact. We were positively charged with giving to a plant a name which we did not give. We denied that we used the name editorially. Now it is charged that it is used in a business advertisement. Having examined this catalogue, and not finding it, we are obliged to deny its existence there. If it is abusive to deny it we are sorry. We charge our friend with no ill intent, only a singular misapprehension; and we in our first article, as distinctly as language will allow, acquitted him of "wilful misrepresentation." . . . 7. "This reminds us" of an occurrence in the Rhode Island legislature many years ago, when T. W. Dorr (afterwards known as "Governor" Dorr) first entered public life. In a discussion with blunt Mr. H., a farmer representative old enough to be his father, Dorr exhausted all his rhetorical resources in an elaborate invective against old Mr. H. When H. arose to reply the assembly, knowing his power when aroused, were in expectation of seeing Dorr completely demolished; the old man, however, pointing his long, skinny finger at Dorr, said, "Mr. Sp-aker, 'taint pooly, 'taint pooly," and took his seat. As our friend J. B. would say, "the bearings of this observation lays in the application on it."

The Planet Drill.—Among the many machines for sowing seeds and distributing fertilizers, the "Planet," made by S. L. Allen & Co., Philadelphia, is quite different in principle from any other we have seen. Up to the present time of writing the weather has been too unfavorable for a thorough trial of the machine, but we have used it with some of the seeds most difficult to sow with a machine, and find it to work excellently, and have no doubt that it will improve upon acquaintance. One of its merits is its great simplicity.

Underground Poultry Houses.—"H. M. S.," Northfield. Upon page 216 of the present number will be found an engraving and description of a poultry-house partly underground, which we know answered its purpose very successfully. But the soil was a very dry gravel, and we should doubt if a similar house in a damp clay soil would answer at all. Fowls can not live in damp places, and a dry situation is necessary for them, especially if they are to live in a cellar.

Young & Elliott.—This well-known firm of seedsmen and florists are removing from their old place in John street to a fine large store No. 12 Cortlandt street, the same in which their plant auctions have heretofore been held. It is rather late to mention the fact, but we would say that the auctions held each spring and fall by this house are an important feature in the plant trade of New York. They receive consignments from florists and nurserymen and plant collectors from far and near, and their auction room is an important exchange for dealers, and not without its attraction for mere sight-seers; indeed, their place is often as interesting as a horticultural exhibition.

Farm Scales.—"J. W. B.," Chester Co., Pa. The farmer who never weighs or measures must certainly lose considerably in the course of a year. The small cost of a platform scale suitable for farm use would soon be saved, and the economy would appear in many ways. The Fairbanks platform scales have a good reputation for accuracy and durability, and they can be procured in almost every considerable village in the country.

Production of Potatoes.—"G. W. A.," Milton, Pa. According to the census of 1870 there were raised in the United States in that year 143,937,473 bushels of potatoes and 21,709,824 bushels of sweet potatoes.

As to Pigs and Pork.—"Subscriber," Sanilac, Michigan. Pigs, unless greatly infested with trichina, show no symptoms of the parasites during life. When badly infested they sometimes suffer from stiffness of the limbs and partial paralysis, but a pig estimated to have sixty millions of trichina in its muscles has shown no symptoms during life. When the flesh has long been infested the cysts or envelopes of the parasites may be seen upon close examination by the unaided eye as small white specks. Infested meat may be eaten with perfect safety if it has been exposed thoroughly to a heat of 212°, the temperature of boiling water. Only pork that is thoroughly cooked can be eaten with safety. The yellow color of the fat of pork is caused by a disordered condition of the animal's liver consequent upon overfeeding during fattening. It is not considered unwholesome and is a parallel case to that in which the flesh of sheep becomes yellow when the disease known as "rot," a liver or bilious disorder, is just beginning. In this condition they fatten very rapidly.

A Great Sale of Horse Stock.—We much regret to hear that the magnificent establishment of the Kansas Stud Farm near Lawrence, Kansas, is to be sold. The senior partner of the firm of Messrs. Sprague & Akers, the Hon. Amasa Sprague, of Providence, R. I., by reason of financial reverses has found it convenient to dispose of his interest. Two hundred and fifty head of stallions and mares descended from the best stock in the country, including Ethan Allen, Rhode Island, St. Elmo, Comus, Erie, and others will be brought under the hammer. The sale at Lawrence, Kansas, commences on the 3d of June, and a sale of equal interest hardly occurs twice in one's lifetime.

Dipping for Scab.—"J. S.," Downingtown, Pa. A method of dipping sheep or lambs is shown in the *Agriculturist* for May, 1873. The sheep dip used for the scab, Buelhan's carbolic dip, may be procured of the Orange Judd Company, 245 Broadway, New York, in packages sufficient for fifty sheep for \$3.00, with directions for use. The sheep had better be shorn before dipping, and afterwards kept in a stable if the weather is cold. The dipping ought to be repeated in two weeks. It will be necessary to rub and break the scabs with a piece of coarse cloth or blanket dipped in the liquid, as the scab insects burrow beneath it.

Three Horses Abreast.—"W. H. M.," Montgomery Co., Pa. When three horses are used to a plow the central line of draft must come in a line with the furrow that is being plowed; otherwise the draft is greatly increased and the side draft must be overcome by great exertion of the plowman. But the side draft caused by the extra horse may be partly overcome by using a draft rod from the side of the beam near the standard, gradually extending outwards from the left on the land side of the beam, and connected with a draft plate projecting from the end of the plow beam on the left sufficiently to bring the inside horse into the furrow.

Turpentine for Crows.—"W. T. G.," Chatham Corners, Canada, says that common black bottles each containing half a pint of spirits of turpentine, hung from stakes driven in the cornfield so that the turpentine can be smelt by the crows in all parts of the field, will frighten them away. If the seed is dipped in common tar and rolled in plaster or dry sand before planting, the crows will not take it.

Male or Heifer Calves.—"J. A. C.," Dover, N. J. The accident of the sex of a calf is one which we can not control. Any person who offers to sell a secret whereby it may be controlled for \$1 or any other sum is either a knave or a fool. A breeder may very easily have ten c. calves this year to one b. calf, but next year the proportion will probably be reversed. On referring to the writer's record of seventy calves born in five years we find 37 c. calves and 33 b. calves, and one of the cows had c. calves each year, while another never had a c. calf at any time. From experience and observation as well as on general principles, we have no faith in any method or plan to produce either sex at will.

Value of Grade Jersey Cows.—"F. M. N.," New Bedford, Ct. Grade Jersey cows that will make two pounds of butter a day should be worth \$150 each. If they were pure bred they would be worth \$300 to \$500, according to their "points" or general appearance. This is not an idle or worthless distinction, as some would maintain, for the reason that animals which breed true to color or "points" may be depended upon to breed true to quality as milkers; and a cow that throws a wild-colored calf may also throw a poor milker, although she may be an excellent milker herself. For this reason a self-colored cow, with all the

marks that are called "fashionable," and which produces calves like herself, is valued at double or treble the price of other cows.

Cotswolds or Leicesters.—"W. P. T.," Clearfield, Pa. Our experience with these sheep is in favor of the Cotswold as hardier and altogether better than the Leicester. We would rather breed for early maturity than for excessive size, and would choose a moderate-sized ram with good, close, heavy fleece rather than a very large one with an open, light fleece. We would also rather use a good Cotswold ram, although he was the sire of the ewes, than a Leicester ram that we did not approve of. One such cross might not be objectionable with sheep if it could not well be avoided.

The Cause of Chicken Cholera.—"Farmer's Wife," Franklin Co., Ohio. We do not think the introduction of foreign fowls is the cause of chicken cholera. The foreign breeds are no more subject to disease than any others. Besides, what breeds have we that are not originally of foreign origin? The cause of cholera is undoubtedly lack of attention to cleanliness, warmth, and to a proper diversity of food, and want of pure water.

Poultry Raising.—"D. K. R.," Shelbyville, Ky. The best time to commence keeping poultry is in the fall or early winter. At that time young hens can be purchased readily. In the spring farmers' wives are not anxious to sell their fowls. If they are fed well and a warm place provided, some of the hens may be set in February or earlier, and some early broods may be hatched out and sold for early chickens. On eight or ten acres 500 fowls might easily be kept, or if skillfully managed double that number. One variety would be found most profitable, unless fancy poultry were kept, when of course there must be a separate house and yard for each kind. A change of roosters should be made each year.

Contraction of the Hoof.—"J. H. D.," Adams Co., Ohio. Probably the best thing to be done in a case of contracted hoof is to fit a set of the Good-enough shoes to the feet without any paring or rasping, to leave the frog and bars altogether untouched, and to depend upon nature to restore the sound condition of the hoofs, which has been destroyed by wrong treatment. Rasping the hoof and cutting away the frog and bars are the chief causes of contracted hoofs, and this injurious practice should be discouraged. The hoof may be occasionally washed with cold water and anointed with glycerine. Tar should not be smeared upon the hoofs.

Hog Cholera.—A. G. Wallace, of Tuscola, Ill., recommends the following as a feed for hogs when the cholera is raging: Use two swill barrels. Mix a feed of bran, shorts, or middlings, and water and feed only after fermentation. This mixture soon becomes sour standing in the sun and is devoured eagerly by the hogs. Feed once a day through the season when hogs are most likely to have the disease. By using two barrels, and mixing in one in time for fermentation to take place before the supply is exhausted in the other, the same degree of "sourness" is maintained. He has fed this regularly for five years in the cholera season, and has not lost a single animal. Others who have tried it have met with the same success. Mr. Wallace has in the same time lost no chickens or turkeys by disease, and he attributes their freedom from disease to the use of the fermented food. The cholera has made sad havoc among the hogs in Central and Southern Illinois this season, and as all the old preventives and remedies have failed, the very simple one above given may prove of value.

Wool-bearing Goats.—"P. H. W.," Washington Co., Md. The Cashmere goat is the wool-bearing goat. The wool or down grows beneath the hair and next the skin, and is very fine and valuable. It is the material of which the costly Cashmere shawls are made. We do not know of any of these goats in this country. The Angora goat, although frequently called the Cashmere by people here who raise them for sale, is a different animal altogether, and comes from another and a distant locality. Its fleece is of long hair and is used for various small manufactures, such as trimmings. The market value is from 30 to 80 cents a pound. We do not recommend persons to keep goats where and when they can keep sheep, because they are not so docile to manage, are not so profitable, and are equally subject to disease, death, and destruction by dogs.

The Most Profitable Stock.—"Subscriber," Poughkeepsie, N. Y. It is impossible to say definitely what breed of cattle may be made most profitable to raise for selling. There is no one breed that holds any pre-eminence position, and the choicest specimens of any breed are sought for by the fanciers of that particular

stock as eagerly as those of any other breed by their fanciers. It is a question of capital and skill altogether. The breeding of Short-horns would require more capital than would the breeding of Jerseys, Ayrshires, or Devons because they cost more and need more costly care and attention, and the risk is greater. The price is proportionately higher, but the profit is no greater than with less costly stock. If there is any choice of breed so far as ease of keep and readiness of sale at remunerative prices are concerned, the Jersey, Ayrshire, or Guernsey stock might probably be the best.

Galloway Polled Cattle.—"D. W. C. II.," Clifton, Ill. There are breeders of Galloway cattle in Michigan and in Canada, but as we have not their addresses at hand we can not give them. The number of inquiries which come to us for the names of breeders of these cattle suggests the propriety of their making themselves known in the usual manner.

A Yearling Jersey Bull.—"A. J. W.," Broome Co., O. "A large and vigorous yearling Jersey bull" may be allowed to serve about a dozen cows; but he should be fed a quart or two of meal a day in addition to his regular feed. A Jersey heifer may be bred at twelve months without injury. This breed is remarkably precocious, and has been bred purposely to produce this condition.

Big Head.—"A. B.," Cass Co., Iowa, and others. The disease in horses known as *osteoporosis*, or "big jaw," or "big head," is incurable. Its seat is in the bone, which can not be removed without destroying the horse.

Breeding Mules.—"M. A.," Florence, N. C. The best mules are bred in Kentucky, and it is not uncommon to find teams there sixteen hands high and weighing 1,400 pounds each. Although occasionally there are larger mules, even as high as eighteen hands, such are rare and undesirable. The use of mules is rapidly increasing in this country, there being over 1,150,000 in use in 1870, against 570,222 in 1850. When properly and kindly used the mule is not the vicious animal it is generally supposed to be, and it is a mistake to be prejudiced against it on that account.

Remedy for Foot Rot.—"J. H.," Lime Ridge, Pa. The best remedy for foot rot is to pare away all the loose horn and dress the diseased parts with muriatic acid. When the fungoid growths have been thus destroyed the foot should be washed in a solution of two drams of chloride of zinc in a pint of water, and if there are any holes in the foot they should be plugged with tow soaked in the solution until they heal.

Keeping Sheep for Health.—"Reader.," East Tennessee doubtless offers some advantages to a seeker after health and profit together in keeping sheep. But the Western plains would be found equally healthful and far more profitable, as pasture is practically free and unlimited in extent. The whole capital could therefore be expended in purchasing sheep, and no land need be bought for many years.

Diarrhea in Calves.—"C. A. N.," Dunville, N. J. Diarrhea in yearling animals exists as a symptom of disease rather than as a disease of itself. It may indicate the presence of worms or other irritants in the intestines, or it may accompany disorder of the liver or of the blood. Without knowing anything but the simple fact of the complaint it is difficult to say what would be the best treatment. It would be safe, however, to give only the most digestible food and no fresh green fodder. Good clover hay cut and mixed with some fine middlings or millstuff and a handful of linseed meal, and the whole scalded and given in moderate quantity when cold would be beneficial. Three ounces of epsom salts, two drams of carbonate of soda, and two drams of ground ginger may be given in half a pint of slightly warm water. After this has operated one ounce of tincture of rhubarb, an ounce of tincture of cardamons, with one dram of carbonate of soda may be given in half a pint of water, and a tablespoonful of molasses, once a day for a few days.

Baling Hay for Market.—When a person buys a bale of hay, it is supposed that he trusts something to the honesty of the person who packs it. This is a great and sad error. It may contain chaff-dust or damaged hay, but the farmer who packs the bale is really the one who suffers. It is a sad reflection that not even a bale of hay is taken on trust any more, and the shipper who has not made a reputation for honesty, although his bales may be perfect in every respect, can not hope to get a top price for his produce. The risk of his dishonesty is discounted by the dealers, who have to

suffer the loss, and it is only when he has become known and has made a reputation that he can hope to get full value for his hay. It is strange that even now there are men who suppose purchasers in cities will pay two cents a pound for sticks, and therefore they ornament their hay bales with stout ones at each corner, which are worse than useless, because they are a standing reproach against the honesty of the farmers who make the bales. The guilty packers do not suffer alone, but cause innocent parties to lose as much as they do. If they only knew that these tricks are unavailing, and that they only cheat themselves, they might act on the principle that honesty is the best policy.

As to Merino Sheep.—"Ohio." The difference between the several varieties of merino sheep consists in the quality of the fleece, and to some extent in the weight of carcass. Some varieties have finer wool than others, and some longer wool; there are also differences in the amount of yolk or grease contained in the fleece. The improved American merino claims to combine the excellences of all the foreign varieties, but although this may not be justified by the facts yet it is a good enough sheep for all our purposes when carefully bred.

Chicken Cholera.—"E. D.," Clinton, Kansas, says after losing 100 chickens by cholera he found that a table-spoonful of soda mixed with a quart of milk and given with the food was a cure.

Ayrshires for Beef.—"G. S. A.," Lincoln, Neb. The Ayrshire ox is an excellent worker and a good beef animal. The Ayrshire cow, upon good feed, is as good beef as the Devon cow, while she is much superior as a milker. Where beef and milk are both wanted, the Ayrshire or perhaps the Dutch cattle would be the best upon your prairies where the feed is good and nutritious.

Selecting Eggs for Pullets.—"J. R. K.," Mendocino Co., Cal. During many years we have made many experiments in selecting eggs for hatching with the purpose of observing whether one kind or another would produce pullets or otherwise. We found that eggs produced one or the other sex of chickens irrespective of their size or shape, and that the shape of the egg depended upon the hen that laid it, and not upon what it contained. Out of a flock of 300 hens we soon learned to distinguish the eggs of a large number each one of which laid eggs of a peculiar and uniform shape, size, and color, and a setting of eggs of exactly the same character in every way so far as it could be discerned produced the usual proportion of male and female chicks.

The Best Sheep.—"S. B. B.," Dover, N. H. A selection of sheep should be made altogether in reference to the locality and the character of the farm upon which they are to be kept. Upon hilly, poor land the Merino sheep or its grades would be the best; upon hilly but rich pastures the South-Down, the Cotswold, or the Shropshire sheep would be suitable; low, flat lands are unsuitable for sheep of any kind.

Metallic Ear-Mark.—"L. M. K.," Adams Co., Iowa. The best metallic ear-mark we know of is Dana's, described in *May Agriculturist*.

Shipping Eggs.—"California." If shipping eggs for market is meant, there is no better way than to pack in barrels with cut straw or chaff. A flour barrel will hold sixty to seventy dozen, and if plenty of packing is used and the head tightly pressed down the eggs will stand much rough usage safely. Eggs for hatching should be packed in dry wheat bran in a light box, which should be again packed in a larger box with plenty of dry straw between the two boxes.

Feeding Meal Wet or Dry.—"J. H. D.," Stouts, Ohio. The most economical way of feeding meal is to mix it with a little cut hay, straw, or roots. Feeding it dry and alone is a wasteful practice, because some of the meal is not digested, and is therefore lost.

Roof for Root Cellar.—"E. M. S.," Worcester Co., Mass. The most perfect roof for a root cellar is an arch of brick laid in cement and covered with a coat of asphalt or gas-tar.

Patent Butter Firkin.—"G. B.," Oneida Co., N. Y. We can not say whether there is any patent upon a butter package which is narrower at the bottom than at the top, or not. There are too many patents for any person to keep the whole of them at his fingers' ends. But if there should be it is infringed every day of the year, and has been for many years back, and by thousands of people, for such butter pack-

ages are more commonly used than any other. The Orange Co. butter pail is just such a package, and there is nothing to prevent any person using such a one.

The Mole Plow.—"J. N. S.," Pendleton, S. C. A good lifting subsoil plow would probably be of better service than a mole plow in any other soil than a clay. The subsoil plow will break up the hardpan, and if the ground beneath is not very retentive of moisture, that is often sufficient to dry the surface without draining. Draining is not always and everywhere required, and is sometimes an unnecessary expense. The mole plow acts best upon clay soils, and there its effects are visible sometimes for three or four seasons, after which it needs to be used again.

Steamer for Feed.—"G. L. W.," Shreveport, La. In another column of this number of the *Agriculturist* there is described a steamer or boiler with which we have been acquainted for several years, and which perfectly answers the purpose of steaming feed. For twenty cows the interest on the cost of a boiler and small engine for cutting the feed could be saved many times over each year. In the *Agriculturist* of January, 1873, will be found a description, with engravings, of a good form of steam chest.

Horse Power.—"J. N. S.," Pendleton, S. C. The Harder railway horse power is considered a good one and with a pair of good-sized mules will be able to run a threshing and cleaner or a cotton gin. A bull of good size would run such a horse power for doing light work. We never found the east-iron endless chain upon railway powers any trouble. With each machine some spare links should be sent, and if one is broken it can be replaced. The broken one may be used as a pattern whereby to cast others. It is strange that you do not see advertisements of these horse powers: they appear in our columns almost every month, and the makers of each kind are trustworthy and responsible parties.

The Scotch Plow.—"W. H. S. G.," Chattanooga Co., N. Y. The plow figured in the engraving on the first page of our April number was made by Gray & Co., Scotland, and was imported by Mr. Wm. Crozier, of Beacon Farm, Northport, Long Island, for his own use. We have no doubt that Mr. Crozier, who is extremely obliging to his brother farmers, would willingly order one for any of our readers who desire it and will communicate with him.

Fumigation of a Meat-House.—"G. M.," McMinnville, Tenn. When a meat-house is infested with the meat-bugs or weevils, a good fumigation for a whole day with sulphur would probably destroy the vermin. The meat should be removed during the operation, for although it would not be injured, yet it would acquire an undesirable flavor.

Three-Horse Clevis.—"T. J. L.," Indiana. The clevis of which you send a sketch is a patented one, and any person using it is liable to pay the patentee a royalty for its use or be called upon to defend a suit. As to the justice of the patent we of course can not give an opinion, but we know that the same contrivance has been in use in Great Britain for many years, and we believe it has also been in use in this country long before the patent was issued. This is not the only patent upon which farmers are called to pay for rights to use devices which have been in use for years before some person was granted a monopoly of them by the patent office.

Iron or Wooden Axles.—"B." The advantages of the iron axle over the old-fashioned wooden ones are chiefly its greater strength and durability, and the less risk of losing the lynch pin and parting with the wheel. An iron axle runs somewhat easier in a wooden box than in an iron box. There is no practical difference in the draft whether the axle is small or large.

Feed Barrow.—"D. P.," Otsego Co., N. Y. The axle of the feed barrow shown upon page 16 of the *Agriculturist* of January, 1874, is formed of two small flanged gudgeons which are bolted to the sides of the barrel. The handle of the barrow is made to fork, and at the end of each fork a hole is punched, through which the gudgeon passes before it is put into the hub of the wheel and pinned to keep the wheel on. The pin is a common spring lynch pin. Or the axle may be a hoop which encircles the barrel at the middle.

Getting Rid of Stones.—"Evergreen Farm," Ct. It would be a good plan to dig drains in a wet meadow forty feet apart, three feet deep, and eighteen inches wide at the top, and twelve inches at the bottom. The drains may then be filled with stones, selecting the largest for the bottom of the drain, and placing them so

that one large flat one is laid upon two smaller ones, thus leaving an arched or covered channel. The smaller stones are to be laid upon these up to a foot from the surface, which will prevent them from being ever disturbed by the plow. If the ground is very wet and springy it would be better to dig the drains four feet deep or thirty feet apart. Although tiles are better than stones for making drains, yet when the stones are at hand and must be got rid of they may profitably be disposed of in this way. If carefully placed in clay soil the stone drains will last many years.

Breast Strap or Collar.—"E. A. B.," Newark, N. J. A horse can draw better in the ordinary collar than with the breast strap. The collar has a bearing upon the shoulders as well as upon the breast, and if it fits well there is no pressure upon the throat. The breast strap having much less bearing is more apt to bruise or press upon the throat when the draft is heavy.

As to Wells.—"A. J. D.," Ottumwa, Iowa. There is no need to go to the expense of making a well so large as is usually done. If water is within 20 feet of the surface the drive may be used with a tenth part of the cost of the ordinary well. But for stock wells and where a larger well is wanted, or where rock has to be passed through, the Jilz anchor well may be put down with a bore of from 6 up to 20 inches at a cost of about a dollar a foot with tubing, etc., complete. If such a well with a wind pump attached were to be put down at the corner where four farms or fields join, at the joint expense, much money might be saved. But farmers, for some reason or other, do not avail themselves of this plan of co-operation as much as people who live in towns or villages do, or as much as they might very usefully do.

Straw-Preserving Thresher.—"A Subscriber," Clinton Co., N. Y. The machine you require is the improved straw-preserving thresher, made by the Wheeler & Melick Company, Albany, N. Y. There are no spikes in the concave or cylinder to break the straw, and the straw is delivered sidewise along a traveling bed on to a horse where it may be bound in even bundles like hand-threshed straw.

Baling Hay.—"A Farmer," Augusta Co., Va. There is no necessity for making hay bales so large as 300 pounds. One hundred pounds is a more convenient size, and the hay may be pressed just as close in such bales as in large ones, and lighter ties will answer. P. K. Dederick & Co., Albany, N. Y., manufacture an improved press in which bales of any size from 100 pounds up may be made, either of long hay or of cut hay.

Tar-Paper for Poultry Houses.—"G. P. A.," West Haven, Ct., writes that he built a poultry house three years ago and lined it as well as the nests with the common tarred roof paper, wrapping the ends of the roost also with the paper where they were fixed to the wall. As he has not yet seen any lice upon the fowls he believes the tarred paper to be a preventive.

Butchers' Offal.—"D. B.," Champaign, Ill. The readiest mode of utilizing butchers' offal is by spreading it upon the ground and plowing it under. After a time a cross-plowing will mix it pretty thoroughly with the soil.

Frost-Proof Fruit House.—"Stewartsville," Ind. A double-walled frame building with a space of a foot filled with chaff between the walls would not be warm enough to keep fruit from freezing in very cold weather. An earth-protected house such as is shown in the *Agriculturist* of October, 1873, would be frost-proof if properly constructed. There should be at least two feet of earth over it and an air space between the outer wall and the lining.

Old Hay.—"Farmer," Danielsonville, Ct. It will be no injury to good hay to keep it until the second year. Many people believe that hay is better feed when over a year old than new hay, at least for horses.

The New Timber Act.—By the provisions of the new act relative to timber culture in the prairie states, a person who homesteads 80 or 160 acres, and has filed his claim, is not prevented thereby from acquiring 160 acres under this act. Any person who is the head of a family, or is twenty-one years of age or over, may take up a quarter section of land for timber planting. There are still many tracts of government land open to settlement in Kansas, Nebraska, and Minnesota, but they are distant from railroads; and on the whole for a person who has the necessary money it will be found greatly more profitable to pay five dollars or six dollars an acre for land near a town and railroad depot than to take land for nothing ten or twenty miles away from it.

Paris Green.—D. Rex asks "if Paris green is a safe remedy for insects upon every kind of plant and which is the best way to apply it?" We should not advise its use upon salads, cabbages, or any other plant the foliage of which is to be eaten. One part of the green, provided it be pure, mixed with twenty parts of flour, is sifted upon the foliage when wet with dew from any convenient tin box with perforated cover. For small operations a wide-mouthed bottle like a quinine bottle with muslin or other open fabric tied over the mouth will serve. Keep to the windward and avoid breathing the dust, and keep the poison always where no accident can occur. It is found that the poison is so neutralized in the soil that no danger can arise from its being introduced into the system of the plant.

How to Feed Salt.—"G. H. A.," North Conway, N. H. The plan of keeping rock-salt before horses and cattle continually is a very good one, but it has some inconveniences. Our plan is to have a barrel of salt in the feed-room, and to scatter a handful upon each bushel of feed as it is cut and moistened in the feed box. In summer time an equal amount of salt is scattered along a trough in the yard daily.

Tomatoes Dying.—"A. N. S.," Savannah, Ga., reports that in Effingham Co., Ga., tomato-plants grow well enough until the fruit begins to ripen, when the whole plant dies down suddenly, and asks us to prescribe a remedy. The first thing we should do in this case would be to carefully examine the root and ascertain whether any insect, large or small, is the cause of the trouble. Should no insect enemy be found we should then try what effect pruning would have. It may be that plants allowed to grow at will set more fruit than can be ripened, and in the rapid swelling of a large quantity of fruit more nourishment is demanded than the root is able to supply. We shall be glad to hear more of this.

Clematis from Seed.—"Mrs. A. L. R.," The best way is to sow the seeds as soon as ripe in a box of earth, and if the plants do not appear the same season, keep the box in a cold-frame over winter and they will be very likely to start the next spring. If no cold-frame is at hand cover the box with boards to keep the storms from washing the earth.

Late Crop of Turnips.—"W. W.," Baraboo, Wis. Rutabagas may be sown with safety as late as the first week in July; they will, however, be better if sown in June. A good crop of white or yellow turnips may be taken from an oat stubble if the ground is in good order and the seed is sown by the first of August or soon after. The best fertilizer after barnyard manure for any root crop is superphosphate of lime or fine bone-meal.

Why they do not Lay.—"C. F.," Detroit, Mich. Fowls will not lay unless they have exercise. A coop five feet by four, and only three feet high, is much too small for a single fowl, much less for seven. A run fifteen feet by four is also insufficient. If the fowls are turned out they will probably begin to lay very soon. They should also have a roomy, airy place to roost in. It is probable that fowls kept up so closely, and well fed, are overloaded with fat, and possibly are infested with lice.

How to Secure a Calf.—"S. W. J.," Fordenskeld, Minn. It has long been a custom when a cow failed to breed to drive her some miles to a hull, and the plan is generally successful. Recently an Irish breeder followed this plan with some Shorthorn cows which had failed to breed for several seasons, and they all became in calf. The ancient poet Virgil speaks of a similar practice as being in use in his day, and also of reducing the quantity of food and the condition of the animal—cow or mare—as a means of procuring fertility. We know of no modern practice that is so effective as these old ones.

"Beautiful Moral but Bad Botany" is the heading of an item in the New York Weekly Tribune. That the paper can judge of a moral we do not care to dispute, what its practice in morals is we shall briefly show, but for it to pretend to judge of botany of any kind, good or "bad," is simply too laughable. In that strange medley which the Weekly facetiously terms "agriculture," there have been some absurdities to which we have good naturedly called its attention. This has set the Weekly to hunt up something in retaliation, and naturally enough it went into the juvenile department, and in the pages of 1868, with the aid of "A Correspondent," it found a "tender, sweet little story" which involved a botanical question, and paraded it in its columns as the opinion of "the Editor of the *Agriculturist*." The editor of the *Agriculturist* never

saw the article before, and is no more responsible for it than he is for the absurdities which appear in the Weekly Tribune. He, however, has his opinion of that kind of journalism which will descend to making an error of the head of a distinct department, made several years ago, appear as his opinion. The "moral" may be "beautiful," but the *morals* which will bring up an obsolete affair as an opinion of to-day, and state it is from the *American Agriculturist* without reference to date or place are of a kind we do not care to qualify. Anything more microscopically small has not occurred in our editorial experience.

Population and Industries of Kansas.—We have received through the kindness of Mr. Alfred Gray, secretary of the Kansas State Board of Agriculture, some extracts from the annual report of that institution for 1873. The exhibit of the present condition of this young but rapidly growing State is very favorable. The population of the State is now over 605,000, against 364,000 in 1870 and 107,000 in 1860, a vast growth in thirteen years; and to this should be added the population in twenty-nine counties which are not yet organized. The increase in productions and in material wealth is equally striking, and shows that those who have made this State their home have gone there to work, and that their industry has been crowned with success. The report is worthy the study of those who are interested in the affairs of that State.

Ditching Machine.—"A Western Farmer," Springfield, Mo. The Carter improved ditching machine cuts a drain three feet deep and a foot wide, leaving the earth in a ridge at one side. With four horses and two men from 3,000 to 5,000 feet of drain may be dug in one day. The machines are made in St. Louis. We have seen the machine doing excellent work in heavy clay soil free from stone. Large stones would be an insuperable obstacle to its use.

Peruvian Guano.—"Market Gardener." The quality of guano is variable, being frequently adulterated, and to procure it genuine it should be purchased of some trustworthy dealer. It can be procured genuine as imported, in small or large lots, of R. Balcazar, 53 Beaver street, New York, who is the special agent of the consignees of the Peruvian government.

Cutting and Grinding Corn-Stalks and Ears.—"L. D.," New Iberia, La. We have found it easy to cut corn-stalks, with ears unhusked and in the sheaf, by using a Telegraph fodder cutter run by a two-horse tread power worked with one horse. The ears and stalks are cut into slices from a quarter to half an inch thick. If the fodder is then steamed it is eaten clean by cows, oxen, or calves, and would be so undoubtedly by mules. If, however, it is desired to make the fodder still finer, a Little Giant cob-crusher would reduce it to coarse chaff. Two-horse power would be sufficient.

Potatoes, New and Old.—"Subscriber," Goshen, N. Y., thinks that our correspondent at "The Pines" in calling Vermont the "mother of potatoes" overlooks the claims of New York State and the labors of Mr. Goodrich in improving the potato. We are quite sure that the gentleman referred to gives full credit to Mr. Goodrich, to whom we are greatly indebted for having started the race of potatoes which finally culminated in the Early Rose and other choice sorts. Had it not been for Mr. Goodrich's labors we should have had no Early Rose, and it is to be regretted that he died just as his work was on the eve of manifesting its usefulness. Our Goshen correspondent says of potatoes in his vicinity: "We have produced some new seedlings, both early and late, from the Early Rose. They are very good, and the public are beginning to look after them. The 'Carpenter's Seedling' has become quite popular as an early variety. Next in season (some later) is the 'Ice Cream.' Very productive, and of superior quality. For the main crop, taking the place of the Peachblow, it is likely to be a particular favorite, especially with the West, on account of its being almost exempt from the ravages of the Colorado beetle. The 'Lawrence' is another variety, only two years from the seed. It has not been thoroughly tested. It is very promising; a handsome potato in appearance."—Our correspondent has obligingly furnished us samples of these, which will be tried with numerous other new and as yet unfamed sorts.

Catalogues, Pamphlets Etc., Received.

MAHLON MOON & SON, Morrisville, Bucks Co., Pa. We have perused this catalogue with much interest, as it contains, besides the usual plants kept by florists, a number of good old things, things that one rarely meets with, and all at most moderate prices. It is a pity that

so good a catalogue had not received more careful proof-reading.

BRIGGS & BROTHER, Rochester, N. Y., issue their catalogue as a quarterly, and the April number is beautifully illustrated, and contains many items of interest to flower-growers. We must take exception to one statement. In a clever chapter on Ferns the writer says of them: "Spores or seeds are produced on the back of the leaves, and are insignificant and of no beauty whatever." As it is mainly by these that ferns are distinguished from one another, they can hardly be considered "insignificant." Even the common Polypody is handsome in fruit than when sterile, and *Polypodium venosum, aureum* and others are vastly more attractive in fruit, as are the *Goniophlebiums* and many others.

THE FLOWER GARDEN is another quarterly catalogue. This is issued by Beach, Son & Co., Brooklyn, N. Y. We have expressed our good opinion of previous numbers, and that for April is deserving of like commendation—only why don't the editor give credit?

LOUIS LEROY, Angiers, France, shows by his catalogue that this old nursery establishment is up to the times with novelties.

VILMORIN, ANDRIEU & Co., Paris, have a seed-list that is a perfect wonder in the way of completeness. These last two houses, each the most extensive of its kind in France, have as their agents in this country the well-known mercantile firm of Pabst & Esch, No. 11 Murray street, from whom catalogues may be had.

THE BULLETIN OF THE BUSSEY INSTITUTION. Part 2d of this valuable contribution to scientific agriculture is at hand, and like its predecessor is filled with elaborate records of experiments made upon the farm at Jamaica Plain (Boston). Our readers no doubt recollect that the Institution is an adjunct of Harvard University, and Massachusetts is to be congratulated on having in it a place where her young men can be thoroughly taught in the higher branches of agriculture.

RUTGERS' SCIENTIFIC SCHOOL, which is the New Jersey State Agricultural College, sends an interesting report for 1873.

CORRESPONDENCE BOTANIQUE is an attempt to give a list of the botanic gardens of the world, in which there is great room for improvement, as far as the United States are concerned. Compiled by E. Morren, and published at Liege, Belgium.

FOREST TREES IN MINN., a pamphlet of twenty pages, by L. B. Hodges, of "practical suggestions," etc. Published by the St. Paul and Pacific Railroad Company, St. Paul, Minn.

WESTERN NEW YORK HORTICULTURAL SOCIETY held its nineteenth annual meeting at Rochester, in January last, and its proceedings come in a valuable pamphlet of fifty-six pages. P. Barry is president, which probably accounts for this promptness.

NEW JERSEY STATE BOARD OF AGRICULTURE.—Its first annual report gives its organization, an account of the work done, a geological map of the state, and other useful matter. Prof. Geo. H. Cook, New Brunswick, is secretary.

THE FLORA OF COLORADO, by Thos. C. Porter and J. M. Coulter, is one of the reports relating to Prof. Hayden's survey, and of great value to all interested in the plants of the far West. Received from the secretary of the interior.

COMMERCIAL FERTILIZERS AT HOME AND ABROAD is the title of a lecture by Prof. W. O. Atwater, Wesleyan University, Middletown, Ct., before the Connecticut State Board of Agriculture, and is of importance to all who deal in or use artificial manures.

THE EDUCATIONAL CLAIMS OF BOTANY is an essay by Miss Eliza Youmans, which should be read by every school officer in the country.

Western Fruit Prospects.

Reports from the fruit-growing regions of Illinois, Michigan, and Ohio, received at the Western office of Orange Judd Company up to May 1st, are generally favorable, and in some cases unusually promising. In Central and Southern Illinois the anxiety is in regard to peaches. The severe winter of 1873-'73 dismantled many fine orchards—so many, that last season the region about Centralia was scarcely counted as a peach-growing district. Entire orchards were cut down, and the fruit-growers turned their backs on peaches. But the young trees escaped with comparatively little injury, and now wherever there are young orchards there is promise of an abundant crop of peaches. In the Alton district the prospect is still better. The trees will bear a full crop, but as there are not as many trees as of old, the crop in the aggregate will not measure with the full crops of former years. As the crop will be mainly from young trees, it

is argued that the fruit will be of superior quality. In the extreme southern part of the State the frosts this season have done much injury to the peach huds. In the Illinois fruit district apples and pears promise well. In the northern district pears do not succeed well. While in northern Ohio the men who have lost peach orchards are turning to pears as a safe and profitable investment, in northern Illinois men will hardly consider the question at all. It is certain that in the vicinity of Toledo we find some of the finest pear orchards in the West, but profits come after a long experience in the testing of varieties. Whether any varieties would succeed well in the vicinity of Chicago seems to be an open question. In the great Michigan fruit district there is promise of a rare crop of peaches and other fruits. While the spring has been unfavorable in a general way, it has not been unfavorable to the fruit interest. In northern Ohio the peach trees of bearing age will give not more than a fourth of the old crop in favorable years. Grape-vines will give probably a fair crop, which means a better crop than last year. Apples, pears, cherries, and all small fruits except strawberries promise well.

North-Western Dairymen's Association.—The eighth annual report of the North-western Dairymen's Association contains the addresses delivered and discussions which occurred at the annual meeting held at Woodstock, Ill., in February last. We have before alluded to the interesting character of these proceedings, and have now only to recommend those dairymen who wish to read them at their leisure to procure a copy from the secretary of the association, G. E. Morrow, of Madison, Wis., or the president, Stephen Favill, of Lake Mills, Wis.

Bees Notes.—Advice to Beginners.

BY M. QUINBY.

Many ladies have written me that they are almost persuaded to become bee-keepers, and have been encouraged by what has appeared in the *Agriculturist*. With a little further direction, they see no reason why they can not turn their labor to more advantage, pecuniarily, than in fancy work. I would say once more to those with sufficient ambition and perseverance, learn how, and I confidently predict success. Fear of stings, that has kept so many from the undertaking, needs scarcely be an objection, now that smoke (that has long been used to neutralize the poison of their stings and quiet their anger) has lately been applied so effectually that there is little risk. The most convenient way of applying it was to set a stick of decayed wood on fire without a blaze, hold it near the bees, and blow the smoke on them. This brought the face often disagreeably near, and sometimes there was danger of fire from sparks blown off. We now place the burning stick in a tin tube, and with a small bellows connected with the tube, held and worked with one hand, it is safe, convenient, and effectual. Mrs. A. has more than one hive of bees—they are in movable combs, of course. She says: "One has apparently become crowded with bees; another seems to work well, but there are not many bees. They have honey enough. What is the matter?" It may be they have no queen. Yet Mrs. A. says "they never bring in honey-bread if they have lost her. I have seen somewhere that they work just as well without a queen as with one." I would advise the lady in question to look inside the best one first. She will need a sharp-pointed, heavy jack-knife, or, what would be still better, a carpenter's scratch-awl, made flat at the point, to use as a lever to pry the frames apart without much of a jar. Let it be in the middle of the day, while it is warm and the bees are busy. We will suppose the operator is timid, and in that case it will be judicious to put on a veil, for an unlucky movement might make the bees angry; yet it must be admitted one can not work as satisfactorily with a veil on. Then go to the full hive—the top is loose, not nailed—slip the knife under, and pry it up from the top, raising it very moderately an inch or two. If no angry buzzing is heard, take it off quietly. Should a jar or too sudden exposure to light get up an excitement, when the top is first raised an inch, the buzz will be heard. Blow in some smoke, which will drive the bees down among the combs. After the top is off, once in a great while a few bees may come to the top of the frames and manifest anger, when a little smoke should at once be directly applied at the exact point wanted. If suspended frames, pry them apart, giving room to take out one from the middle without touching others. Be careful not to crush any bees. Pry all the frames loose, and lift one out. If the other kind of frames, begin on the outside, and move sidewise first, then hack half an inch, and unhook and lift it out. Sometimes, even at this season, they are nearly out of honey. If they have any sealed up, there

is not much danger of starving. Look at all the combs as you take them out, and if there is no sealed honey, feed a little. If there is enough, see how much sealed brood they have—don't mistake that for sealed honey; the brood is generally near the center of the hive, they spread it from there each way. Estimate the number of square inches sealed in each comb. Fifty square inches in each, of six or seven combs, will make a tolerable swarm when it hatches. Find the queen while you are looking, catch her, and cut off one wing—she will never leave with a swarm for the woods afterwards. If they are making preparations for swarming, queen cells may be seen, most of them containing larvae, and a swarm may be expected to issue the next fair day after the first cell is sealed up. After seeing how the inside of a good, thrifty stock appears, it is well to examine a weak one, and find what is wrong there. Proceed to open it in the same way. Most of the bees will be found near the center. Examine the combs there for the queen, brood, eggs, or foul brood. There are many things to prevent an increase of bees. The eggs of a bee must be kept warm, like those of a fowl, to hatch well. Bees enough to feed and rear them are necessary. The warmth in a weak hive is generally deficient. If no disease, see if they have any brood sealed. If that is found, the queen is probably all right, without bees enough to keep the eggs warm. If no brood is in any stage of development, and no queen can be found, it can be put down as queenless, but not to be discarded. There are combs worth several dollars and some bees, and may be something can be done to save them. Take from the best hive a comb with brood ready to hatch, as nearly as can be judged, as such require no nursing. An empty comb—at least one without brood—can be taken from the light hive and put in the place of the one taken containing the brood. See where the bees are thickest in the light hive. Part the combs there, and put in the one containing brood. Close the hive all but one small entrance, to make it as warm as possible, and the maturing brood will strengthen the colony materially. If they hatch well, another comb can be given in a week or so, and still another until strong enough. Occasionally the queen is lost while there is brood to rear one, and they do it. In such a case, the remains of the queen cells will be seen. A young queen, before laying, is not so easily found as the old one; she is nearer the size of workers, and very active. To make it more certain that there is no queen, look again in three or four days after the first examination. They will have started some queen cells over some of the brood that was given them, if there is none. If no cells are started, it would indicate that there is a queen and she is either too young to lay or barren. If no eggs in ten days it shows the latter; when she must be found and destroyed. If not likely to have a laying queen of their own, give them one; but it will not do to leave her to make the colony strong without giving brood. If any hive has swarmed, queen cells may be had in place of the queen. The young bees that have hatched from the first comb of brood will be more likely to succeed in raising a queen than the old bees that were in the hive. By continuing to change combs with the strong, the weak ones can be made as good as the best. One queen will generally lay eggs enough for two hives, if change of combs is properly made. After there are bees enough to nurse a larger number, more of the brood that is not sealed up may be given them. Occasionally a hive is only weak from want of brood, which, if introduced in this way, will soon make a worthless hive a profitable one. The condition of every hive should be understood. Learn to distinguish between a good and a poor one. This can be done now more conveniently than ever before; and I have consequently more hopes in the success of ladies. They will take time to study the subject more deliberately, think what they want to do, and why, and help discover many things yet in the dark.

Increase of stocks will be desirable. But let strong colonies be the first idea. When all are so, and the yield of honey is good, you can choose between surplus honey and increase. An excess of both is not often realized. I advise putting boxes on full hives, and allowing the bees to fill them if they will. Keep watch for the queen cells, and if they are determined to swarm, make them do it artificially. Directions for doing it have already been given. If the honey is extracted, not more than one in fifty will try to swarm. In most sections, but little surplus is collected after the first of August. If there has been no increase, and there are bees enough, it will do to divide at this time, if care is taken to feed according to their needs. When there is no buckwheat or late fall flowers, a colony may be wintered by feeding. It would be well to have a laying queen ready to introduce when divided at this time. Twenty-five pounds of sugar will take a swarm through the winter, when they have no honey.

Learn how to make all stocks strong, and to know when they are strong.

Very many allow their bees to build their combs

crooked on the frames, through neglect, and can not examine them in consequence, and then inquire what shall be done. I will give a specimen:

CHESTER CO., PA.

I have two colonies of bees in Langstroth's movable comb hive. I would like to take out the frames to examine them, but the bees have run the combs zigzag so that I can not get them out without much cutting. I want to artificially swarm them this summer. How shall I proceed?

HOWARD D. BUSH.

I have many such. The proceedings should be in accordance with the shape of the combs. They are much more crooked sometimes than others. When very crooked transfer as from a box hive. Quite often on one side, on one or more frames the combs are straight. Sometimes a part of the combs will run straight part way on the frame. First, see to how many frames one comb is attached. If any are disconnected with others take them out first. These can generally be seen from the top. When the colony is strong and the weather cool enough for the *propolis* to snap and jar the bees enough to wake them up, it will be necessary to use smoke. The top of course is off. The combs that cross the frames are welded fast to the sides of the hive. Now you want a long thin knife—a carving knife will do. Drive the bees away with the smoke from the place you wish to loosen. Cut every comb from the sides of the hive. With a sharp-pointed instrument loosen the frames where they rest on the rabbeting, but do not move the frame enough to break the comb. Put on the top or honey board, and turn the hive bottom upwards. If the frames, where they rest on the rabbeting have been properly loosened and the combs all cut loose from the sides, the hive can be lifted off, leaving the combs standing. Don't be alarmed and think the stock ruined, and feel afraid of being stung. Nothing of the kind will occur if you have used smoke judiciously. Keep cool and think what is to be done. Smoke and drive the bees away from where you want to see the comb. If there is any comb straight part way on the frame, leave it fast. Cut off all that crooks from a straight line; keep the pieces as large as possible. As you cut them out lean them against something pretty straight up for a time. When the bees gather in little clusters they may be brushed or shaken into an empty box for the time being. As soon as a frame is loose and separated you can proceed to fill it with combs; hold it with small sticks fastened just as directed last year for transferring. Cut off drone comb. Set up the hive and put into the frame with the combs straight. They will soon be fastened, when the sticks may be removed. If necessary to use drone combs to fill the hive, let them occupy the outside frames. If the hive is such as I recommended last June, which could be enlarged or diminished at pleasure, there would be no need of using drone comb to fill it. If bees have to build comb to fill the hive at this season, it is quite sure to be drone cells. In filling the frames, if there are spaces an inch or two square left there will be no great loss, and bees fill them with the large cells. It is possible that rearing a few drones in combs of this size, may gratify an instinct and stimulate to some benefit.

Ogden Farm Papers.—No. 52.

Six years ago there was formed an association of breeders under the name of the "American Jersey Cattle Club." The purpose was to establish a "Herd Book" and to encourage the breeding of pure animals. The association now includes more than one hundred of the principal breeders of this stock, most of the northern and some of the southern states being represented in it. Great care is taken to admit to membership only the most trustworthy men, and no pedigrees about which there is the least room for doubt, are accepted without the indorsement of a member.

Three volumes of the "Herd Book" have been completed, and nearly five thousand pedigrees are recorded. This part of the work goes regularly on, and the book is now self-supporting, so that the fund derived from membership fees can be appropriated to other purposes. At the recent annual meeting \$600 were appropriated for the procurement of an essay on Jersey cattle, which shall be adapted to making their advantages for American uses generally known. Three prizes are offered: 1st, \$250; 2d, \$150; 3d, \$100; and the amount

remaining is to pay for the cost of publication and distribution. It was also decided to hold a show of Jersey stock in connection with the Centennial Exhibition in Philadelphia in 1876.

My attention is called by a correspondent to the "Basket" item in the *Agriculturist* for May, entitled "Jersey and Alderney," which he thinks calculated to mislead. He asks whether there are any Alderneys in this country, and whether they can be entered in the Jersey "Herd Book." There are four principal islands in the Channel group—Jersey, Guernsey, Alderney, and Sark. Jersey, the largest, is about the size of Staten Island, in New York harbor; Guernsey is less than half the size of Jersey; Alderney is only about one sixth the size of Jersey (about 2,500 acres); and Sark is (in arable land) considerably smaller than Alderney. These are usually called, not the Alderney Islands, but the Channel Islands. They have two distinct breeds of cattle—Jersey and Guernsey. Sark has a mixture of the two, and Alderney is stocked with animals originally from Jersey, but with the admixture of some Guernsey blood. It is not usually considered a distinct breed, and is not accepted as a pure race in the other islands. Alderney cows are apparently degenerated Jerseys, or rather Jerseys which have not been improved as they have been in the larger island. I know of but one Alderney cow in America ("Lottie," belonging to Mr. Wm. F. Botts, of Philadelphia), and she has every appearance of a Jersey, though she has been refused admission in the "Herd Register" of the American Jersey Cattle Club. The name "Alderney" was given to Channel Islands cattle because the early importations into England were from that island, where there are many English residents, and it has probably been retained by mere force of habit. Its retention in this country was perhaps due in part to the confusion that might follow between Jersey and New Jersey. What we call Alderneys are almost exclusively Jerseys. There are a few Guernsey cattle in the United States, but not enough to constitute a prominent class. They are large, rich milkers, and good farmer's cows, but they lack the characteristic beauty of the Jerseys, and are on this account less attractive, even to ordinary farmers, who like handsome animals as well as any other class in the community.

During the past month I have been "neighboring" among some farmer friends in Massachusetts, and have had some light thrown upon the question as to whether farming is a good business in New England.

Mr. Edward Burnett, of Southborough, is a young man who, during his college vacations, and even as a boy before he entered college, indulged his agricultural tastes by hiring himself out as a farm hand, and learning the business from the bottom. Mr. Bowditch, of Framingham, tells me that he used to pay him during haying and harvest \$40 per month and board, and considered him the best hand he ever had. During this occasional apprenticeship, he boarded with the farm hands, and was in all respects on the same footing with them, so that he became a thorough-going, practical farmer. When he left college, he took the management of his father's farm, which was well improved, and when he married he bought the farm (200 acres) on mortgage, and went at it like a man to work his way out. From present indications he will

not be very long in demonstrating his success. Of course he has material advantages in having fallen heir to many improvements, made without especial reference to their cost, and which a farmer beginning at the bottom of the ladder would not have—some which, although valuable, are hardly worth what they would cost to make anew. On the other hand, he has as good a farm to lose money on as could well be found, if he would only develop its resources in this respect; and nine men out of ten, not used to farming, taking it with a good capital, would swamp their fortunes in very few years; for a good farm, with the appliances for fancy farming, responds very promptly to the influence of neglect and bad management. It will be fertile in disaster or in success exactly according to the skill with which it is managed. Mr. Burnett may be safely depended upon to steer his craft in the right direction, and to demonstrate the possibilities of agriculture in New England, which seems to me to offer a better opening to an enterprising man than does that of any other section of the country.

All that New England seems to lack is a fertile soil—its fertility has waned, and the brood which fed upon it in its "virgin" days has gone West, and further West, leaving in their whole track a worn-out soil and a prosperous and well-peopled land. They have earned to the country more than they have cost it, and I am not disposed to give them anything but praise. But it remains for us, who benefit by their pioneering, to restore the productiveness of their fields, and to follow their simpler destructive farming with a system that has been made possible only by the general prosperity they have initiated. The farm that we have to cultivate is less rich than they found it, but it is in the midst of a wealthy and thriving population, and this is an advantage that can hardly be overrated. If we work as though our farm were in Western Iowa, we shall probably fail—and deserve to fail—for our poor land can not compete with the Western farm, under the same system. But if we realize the fact that we have, within easy reach, a market that is eager for the best and freshest products of a sort that will not bear long transportation, and that we are surrounded with towns and villages from which we can get an abundant supply of manure, we shall see that our circumstances are worth more to us than our acres, and shall introduce into our operations an element of success that is impossible to those who are more remote.

The most hopeful thing about Mr. Burnett's case is that he has realized this condition, and works to meet it. His cows are pure Jerseys (and good ones) and he has a ready market in Boston (by contract with a large hotel) for all his butter at 75 cents per pound. Then again, he makes a large item of the swine, which feed on his skimmed milk (and on corn-meal), and of similarly fed pork, which he contracts to take from butter-making farmers in his neighborhood. He does not go into Faneuil market and sell for the going price for the best quality, but advertises that he makes a specialty of family pork, fed on milk and corn alone, and put up with the greatest care; that he will deliver at private houses in Boston, free of cost, lard, bacon, jowls, shoulders, hams, and sausage-meat at 20 cents per pound. In this way he gets 10 cents per pound for the cost of raising and dressing his pork, which pays, and

another 10 cents per pound for preparing for market in the best manner, and this pays enormously. Another item of his business is the sale of family cows. These he buys from farmers far and near, on his own reliable judgment, at fair farm prices, and is able to sell at a good advance to persons who have confidence in him and in his knowledge of cattle, but who have neither the time nor the experience to select for themselves.

His whole system is based on advertising, reputation, and the demand for strictly first-class supplies for families who can afford to pay extra prices, and who know the value of extra quality; and this is the best basis he could possibly have—the only one which takes his circumstances as they actually exist, and makes the most of them. If there is any better definition of good farming than this one of *making the most of all existing conditions*, I have not found it out.

I imagine the comment being made, as it always is made, that if everybody did as Mr. Burnett does, there would be no extra quality and no extra prices. Exactly! But everybody won't. It is only the very, very few who will ever try to do the best that can be done, and such examples as the one now given will always be rare. It is given not as praise to a friend, but as an incentive to the few enterprising men who are well located, here and there, in the Eastern states, and who really "mean business" when they undertake an improved style of farming—men who are destined to be valuable examples of success in farming, and to revolutionize the agriculture of their neighborhoods, and who are to be followed by others who will be as far in advance of them as they are of the average standard of to-day.

It is not safe to advise any young man to adopt farming as the business of his life; but to those who have decided on this, it is surely safe to advise an emulation of the example of Edward Burnett, beginning, as he did, with the hard work of the farm, hand in hand with the other hired men, and learning the details of all kinds of work by downright hard work, until, like him, they can beat many a born farmer in the harvest-field, and many a born dairy-woman in the butter-room.

I hope I shall be forgiven if I temper my commendation with a little criticism, which I do publicly (as I have to himself in private), and warn eager youngsters against the error of being "boss and all hands." It is too much to ask of any merely human mind and body to work like a slave from morning until night in hard field work, and at the same time to manage the business and carry on the correspondence of such an establishment as I have described. It is very important that the head of such a farm should be able to do any sort of work in-doors or out of doors, and to know how to get it done by others; but the large capital invested, and the important outside interests on which success so largely depends, are not fairly treated when they get only the guidance of a work-wearied brain. The one part of the work which can not be hired done is the part to which the owner's first care and best and freshest efforts should be given. If you are your own foreman, you must be always to the fore, and exhaust your capacity in manual labor. It is better to have a good hired leader, and put a shoulder (physical or mental) to the wheel whenever and wherever it is most needed at the moment. Labor is one agent you have to employ, but business man-

agement is an equally important one; and as the captain of a steamer is worth more in the pilot-house than in the stoke-hole, so is the manager of a large farm worth more in the general direction of his operations than at the end of a hoe-handle.

Another example of a young Harvard man turned farmer, is Mr. E. F. Bowditch, of Framingham, who has taken 400 to 500 acres of worn-out farms, and built up a capital establishment, to which he devotes his whole time, and on which he is reaping a permanent and satisfactory success. His case is less instructive than Mr. Burnett's, because he started with a capital that few young men turning farmers can command; but it is, at the same time, an example well worthy of the study of all who go to the business hoping to find it at least an inexpensive pastime, and who too often do find it a most wasteful extravagance. Like Mr. Burnett, he is a breeder of Jersey cattle, of which he has an unusually fine herd, descended from his own importations, and he sells his butter at a high price in Boston. It was largely a desire to see his Jerseys which led me to visit him, and I found them well worth the trip. I am sure I shall be doing a favor to my readers, to whom this may come in time, by calling their attention to the fact that he advertises an auction sale of twenty or thirty head—his surplus, but including some of the best of his herd—to take place in Boston on the fourth of June. This will be a good opportunity to purchase, and an equally good one to study the characteristics of some excellent specimens of the breed.

A correspondent in Illinois writes: "I wish you would call attention to my way of preventing cows from kicking, though it is by no means my invention. I know that not one farmer in a hundred knows how to do it. I use it in breaking my heifers to milk, with great success. Take a strong strap and buckle it tight around the cow, in front of the bag and back of the hip-bones. If drawn tight, the cow can not kick, and she will soon cease trying." This seems like an efficient remedy, and it is so simple and safe that it is well worth being brought to the attention of those who have restless cows and nervous or sore-teated heifers to train.

The long continuance of cold weather this spring made it necessary for us to buy a small stock of hay, but our own supply, which was of excellent quality, lasted until April 25th, and we are fully content with the result thus far. One help we had from outside, it is true. We last spring hired two acres of clover which had been sown in 1872 with barley. It was intended for soiling, but we did not need to use the whole of it in this way, and made a part of it into hay. We weighed all that was brought to the farm. Allowing six tons of green clover to make one ton of hay, the crop of the two acres was equal to *eleven and one half tons of clover hay*. This heavy crop was due to the good management (good management in this case meaning heavy manuring) of the owner, who is one of our best farmers, with a firm

conviction that what is worth doing at all is worth doing well. He has another firm conviction, which is that good land is worth a good rent, and he charged me \$200 for the rent of that field for one season.

Swivel Plows.

The advantages of the swivel plow are not so well appreciated as they should be. A few years ago, desiring to test their value upon level ground, we did the whole of our spring and fall plowing with them. We used one of them which was designed only for hill-side plowing, and by no means so well calculated for level work as some of the newer and improved plows, both for sod and stubble, and found it a great saving of time and labor. By returning upon the same furrow we went up there was no waste in going around the headlands, and the harrow could follow close up to the plow. Thus, in corn planting in the spring or in sowing wheat or other crops, every foot of plowed ground at the close of the week could be finished and sown or planted, and on Saturdays the week's work evenly and neatly done up. Besides, the seed could always be put into the ground while the soil was mellow and moist, an advantage in some seasons of great importance. The annexed engraving shows one of these plows greatly improved and furnished with a coulter for plowing sod. It will be seen

SWIVEL FLOW.

that the character of the mold board is such as to insure easy draft, and as in using these plows each horse alternately walks in the furrow the labor of the team is greatly lightened. The efforts of plow makers have been industriously turned of late to the improvement of these plows with great success, and it needs only that the attention of farmers should be drawn to them to profitably extend their use.

The Use of Steam on the Farm.

As compared with other industries the business of farming is not carried on economically. The cost of producing what there is to sell is too high, and the profits are reduced accordingly. Steam power is made useful in nearly every industry but farming, and in that horse power is the sole dependence. At some future time it is probable that much of our field work will be done by steam. At the present time a large share of the in-door work of the farmer may be. A great portion of his business and labor is in feeding stock and preparing their feed. It has been frequently shown that when feed is cut and steamed it is fed with the greatest economy. The great bugbear connected with it is the labor needed to cut and steam the feed. It is said that it will not pay to steam feed for less than forty or fifty head of

stock. We are satisfied from our own experience that it will pay with only ten head. Where there are less than ten head of stock upon a farm the use of steam will in most cases

Fig. 1.—SECTIONAL VIEW OF BOILER.

make it profitable and practicable to increase the number up to ten head without extra cost of food or labor in preparing it at all in proportion to the increase. As to the cost of the machinery, it is well worth considering whether if a five-horse power boiler and engine that could do all the inside work of the farm, cutting feed and steaming it, thrashing grain, hoisting and unloading hay or grain, sawing wood, and any other work needed, could be procured for \$580, all complete and ready to run, and could be operated with safety from fire or explosion, it would not be a great economy; the cost of fuel, too, being less than fifty cents a day for such an engine, and that only while it is working. The first cost of five horses, harness, etc., would be considerably more than the cost of such an engine and boiler, not to speak of the cost of maintenance. The boiler and engine we here specially refer to are made expressly for farm use, by Whitman & Burrell, of Little Falls, N. Y., and are known as the Anderson steam boiler and the Kipp engine. A sectional view of the boiler is shown at figure 1, and the boiler, water-tank, and engine at figure 2. The boiler is double, so that water completely surrounds the fire space. The large heating surface requires but little fuel, and the water-tank is so arranged that while the supply of water is kept up there is perfect safety. The engine is compact, and of very strong and solid construction, and is made as small as two-horse power. An engine of three-horse power needs no more fuel than an ordinary stove of common size. It is impossible to doubt that there are thousands of farms

Fig. 2.—ENGINE, BOILER, AND WATER-TANK.

upon which steam power so cheaply procured would be a great advantage and its purchase an economical investment.

Some Wild Ducks.

BY J. H. BEATTY.

Upon this page are illustrated four drakes of very beautiful and somewhat rare native ducks. They are generally known to the sportsman, and all to the ornithologist, yet they are almost strangers to the general public. There are forty-one distinct species of ducks that inhabit North

striped with two longitudinal black bars, which meet near the base of the bill and spread as they approach the neck, making a V-shaped figure. The tail is slightly rounded, the quills pointed and brownish black; back brownish black, with two small patches of white on the rump; wings brownish black; coverts white; secondaries curved, hanging pendant over primaries; back, neck, and shoulders

the crest lies flat. The systematic name of the Hooded Merganser is *Lophodytes cucullatus*. The male has its head and neck black, with a half crescent shaped patch of white extending along the top and back of the crest; the upper parts are black; secondaries and scapulars striped longitudinally with white; base of neck banded with a crescent of white; sides brownish, finely barred with brownish black; tail

Fig. 1.—KING EIDER DUCK.

America, including the Teals and Mergansers, and twenty-six of these are common to our Eastern waters. One of the largest, rarest, and most beautiful of ducks is

THE KING EIDER DUCK, *Somateria spectabilis*, or King Duck. It is the most boreal of its family, and during the severest winters it is seldom observed south of the Bay of Fundy. Its migrations are not so extensive as those of other ducks, and it ranges on our Eastern coast from Machias, Maine, to the Arctic Ocean. The King Ducks are erroneously known to the cod and herring fishermen as "mongrel sea ducks," and are by them supposed to be hybrids between the common Eider Duck and some other species. They breed in Labrador in considerable numbers, but the greater body of them nest further north. The specimen from

white; top and hind head pale dove color; checks sage green; forehead furnished with a fleshy knob or perview, membranous protuberance, partially divided by a black band of feathers which extends from the nostrils to the top of the head; bill rather small, toothed, and furnished with a strong nail at the extremity of the upper mandible.

THE HOODED MERGANSER is widely distributed throughout the United States, and may be called a fresh-water duck. I have taken several females near the Fire Islands, N. Y., but they were migrating, and evidently were more in search of a resting-place than of feeding grounds. This duck is often found in company with the young of the year of the Buffel Head in the inland lakes and rivers during the autumn. It feeds on fish,

long and rounded and brownish black; bill long, narrow, convex above and underneath, and deeply toothed; eyes light yellow. The dimensions of the specimen from which the drawing (fig. 2) was taken are, extent 27 inches, length 18.50 inches. While the Hooded Merganser is by some authors placed in a separate genus, *Lophodytes*, others include it in the genus *Mergus* with the

RED-BREADED MERGANSER, *Mergus serrator*, which is also called the Fish Duck. It is not a rare species in this country, and is found also in Europe. Like our only other species, *M. Americanus*, the Shelldrake, this has a red bill with the upper mandible furnished with sharp recurved teeth; the male has a conspicuous crest; the head and upper part of the neck dark green, the under parts reddish white; the

Fig. 2.—HOODED MERGANSER.

PINTAIL OR SPRINGTAIL DUCK.

which the illustration (fig. 1) was taken was shot in Labrador in Nov., 1871. The eggs of this duck are small in proportion to the size of the bird, are of a uniform pale green color, and from three to seven of them are deposited in the nest, which is made of moss and lined with down plucked from the breast of the female. The King Duck is black from the breast to the tail; breast cream colored; throat whitish,

and is an expert at diving. When wounded, it often gives a severe chase to the hunter, who when it appears on the surface of the water after diving bangs away at it in vain. It has a large, full, hair-like crest or hood, which can be erected or depressed at will. When the bird is swimming on the water the crest is raised, giving it a very showy appearance, but when it is flying or swimming under the water

RED-BREADED MERGANSER.

portion just above the breast reddish brown, streaked with black. The sides are conspicuously barred with transverse black lines, and the white of the wing is marked by two black bars. The only remaining species that there is at present room for, is a bird well known to sportsmen as the

PINTAIL OR SPRINGTAIL, *Dasila acuta*, more nearly related to the proper ducks than any of

the other species here figured, and distinguished from them by its much narrower bill and its remarkably pointed tail. Its bill is black above and below, and on the side a deep blue; the head and upper part of neck deep brown, with a green and purple gloss behind; the lower side of the neck, breast, and body white; the back and sides finely lined with black and white; there are sixteen tail feathers. This duck is common all over the country, and in the fall of the year is very common in the New York markets, which are principally supplied from the West, large numbers are sent from that part of the country in the fall, and there is an irregular supply all through the early part of winter. The marketmen call it also Winter Duck. It is one of the prized varieties for the table. We have engravings of other species which must wait until another time.

Walks and Talks on the Farm.—No. 126.

"W. W.," of Fairfax Co., Va., who is raising early lambs for Washington market, asks if it is true, as he has heard, that Cotswolds are too slow in maturing for this purpose. It depends on the kind of Cotswolds—or, more correctly, on how they have been bred. If the object of the breeder for several generations back has been to obtain the largest sheep, if the breeder has aimed at size and that only, then doubtless such sheep will not mature early. I am sorry to say that some breeders of Cotswolds have done this very thing.
